I, II + IX)

PREFACE.

The Gazetteer of Cachar lacks what is generally associated with works of this nature, *i.e.*, a directory. There is, however, only one town in the district, and that town has been described at length. The great bulk of the population live on tea gardens or in villages, which do not lend themselves to a detailed description, and a directory of these villages would be entirely out of place. Lists of all the tea gardens and of all villages that are centres of trade have, however, been appended to the volume, and reference has been made in the text to all villages which are noted for any special industry. It is hardly necessary to add that whenever the Province is referred to, it is to the old Province of Assam, as constituted in 1904, that reference is made. My acknowledgments are due to the Deputy Commissioner, Captain Kennedy, for his kindness in examining the work in proof.

CONTENTS.

CHAPTER I.

PHYSICAL ASPECTS.

General aspects—Mountain system—River system—General appearance and scenery—*Bils*—Geology—Mineral deposits—Climate—Storms and earthquakes—Fauna. Pages 1—18.

CHAPTER II.

HISTORY.

Traditional origin of Kacharis—Wars between Kacharis and Ahoms—Migration to Maibang—Migration to Cachar Plains—The eighteenth century—Approach of British—Conversion to Hinduism—Invasion of Cachar from Manipur—Restoration and death of Gobind Chandra—Native system of administration—Pemberton's description of Cachar—Revenues of Kachari Raja—Tula Ram Senapati's territory—Development of the Cachar Plains—Destruction of mutineers in 1857—58—Sambhudan's rising in 1882—Frontier troubles—The Lushai raids—Murders at Baladhan—Archæology. Pages 19—41.

CHAPTER III.

POPULATION.

Area and density—Growth of population—Migration—Sex—Marriage—Infirmities—Language—Caste—Religion—The Shahaj Bhajan—Hindu festivals—Sacred places—Muhammadans—Christianity—Occupations—Hindu marriage ceremonies. Pages 42—62.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Crops grown—Rice—Mustard—Fibres—Agricultural implements—Sugarcane—Cultivation in the hills—Causes affecting productiveness of land—Garden crops—Yield and value of crops—Live stock—Grazing—Cattle disease—Tea—Development of industry—Labour supply—Varieties of plant—System of cultivation—System of

manufacture—Outturn and prices—Green tea—Forests—The reserves—Timber trees—System of management—Timber trade—List of reserved forests. Pages 63—90.

CHAPTER V.

INDUSTRIES.

Arts and industries—Lac—Weaving of cotton cloth—Eri silk—Pottery—Saw mills—The fishing industry. Pages 91—98.

CHAPTER VI.

ECONOMIC CONDITION OF THE PEOPLE, COMMUNICATIONS, TRADE, TOWNS, AND LOCAL BOARDS.

Subletting—Wages—Prices—Economic condition of the people—Social restrictions—Communications—Railways—Roads—Inspection bungalows—Bridle paths—Ferries—Water communication—Post and Telegraph—Trade—Towns—Local Boards. Pages 99—118.

CHAPTER VII.

GENERAL ADMINISTRATION.

Native System of land revenue administration and early British settlements—The settlement of 1884—The settlement of 1900—Expansion of settled area since 1830—Waste land available for settlement—Disforestation—Different forms of land tenure—Incidence of land revenue—Land revenue collection—Town lands—Opium—Country spirit—Ganja—*Laopani*—Income tax—Stamps—Public works—General administration—Criminal and civil justice—Registration—Volunteering—Police—Jail—Education—Medical. Pages 119—151.

CHAPTER I.

PHYSICAL ASPECTS

General Aspects—Mountain System—River System—General appearance and scenery—*Bils*—Geology—Mineral deposits—Climate—Storms and earthquakes—Fauna.

THE Cachar district, which derives its name from the Kachari tribe, is situated between 24°8' and 25°49' N. and 91°28' and 98°81' E. It is bounded on the north by the Jaintia Hills, Nowgong, and the Naga Hills; on the east by the Naga Hills and Manipur; on the south by the Lushai Hills district; and on the east by Sylhet and the Jaintia Hills. The district consists of two distinct portions—the hills, which are a section of the Assam Range, and the plains, which form the eastern extremity of the Surma Valley. With the exception of an insignificant tract of level land in the angle formed by the junction of the Kapili and the Doiang, the whole of the North Cachar subdivision, which covers an area of 1,651 square miles, is hilly country. The area of the two remaining subdivisions of Silchar and Hailakandi, which is generally classed as plain, is 1,918 square miles. It must not, however, be

General Aspects.

supposed that the whole of this very considerable area is actually level land. The Silchar subdivision includes the southern section of the Assam Range, a belt of hilly country, with an average width of six or seven miles, containing peaks between three and four thousand feet in height. On the eastern frontier there is the Bhuban range, which covers a considerable area, and rises in places to over 8,000 feet above the level of the sea; while on the west of the Hailakandi valley the Chhatachura or Saraspur hills stretch in a continuous line to the Barak. Almost the whole of the country north and south of that river is, moreover, dotted over with low ranges, or isolated hills called *tilas*, which rise like islands from the dead level of the alluvium; and it thus follows that a large proportion of the Cachar Plains is not level land at all.

Mountain
system.
North
Cachar.

From the Jaintia Hills to a point a little to the west of Asalu, the Barail or 'great dyke,' runs almost due east and west across the district, and forms a continuous wall of mountains, gradually increasing in height towards the east. Kalangtam, where the range enters Cachar, is 4,886 feet above the level of the sea; the next important peak is Jentahajuma (5,127 feet), while Sherfaisip, a little to the north, is 5,617 feet. To the south-east of Haf-lang there are three peaks over 5,700 feet in height. Here the range takes a sharp turn towards the north, and reaches its greatest elevation at Hampeopet (6,158 feet), but from this point it gradually declines in height, and at Laikek, a little before it enters the district of the Naga Hills, it is only 2,628 feet above sea-level. Almost the whole of the district north of the Barail is a mass of

hilly country. The general tendency of these hills is to run north and south, but there are only two well-defined ranges, and few summits above 3,000 feet in height. Except on the west these hills take the form of serrated ridges, which rise sharply from the streams which hurry down the valleys at their feet. In their natural state they are covered with dense tree forest, and this is the condition in which the summits still remain. The lower slopes have generally been cleared for the shifting cultivation of the hill-men, and during the interval of rest that is allowed between each period of cultivation are covered with a dense growth of high grass jungle and bamboo. South of the Barail there is a belt of hilly country containing several ranges of some importance with a general trend from north-east to south-west. On the west of the Jatinga river there is a short range with one peak, Damcharahaju, over 8,000 feet in height; while the hills on the eastern side of that river rise to an altitude of 4,402 feet at Upulia, and 8,684 feet at the sanatorium of Nemotha. Further east there are two considerable ranges, which run almost north and south and rise to a height of between three and four thousand feet.

The Bhuban hills are a continuation of the Lushai system, and run almost due north along the eastern boundary of the district to the junction of the Jiri and the Barak. The main range contains peaks varying from two to three thousand feet in height, and throws out a continuous succession of spurs on either side to the east and west. The Rengti hills, like the Bhubans, project from the Lushai system, and are separated from the Bhubans by the broad valley of the Rukni and Sonai.

Hills in
South
Cachar.

Shortly after entering the district they throw out a well-defined spur towards Barunchara on the west, but the main range continues northwards past Cooly Ghat, and then takes a sharp bend westward to Jafirbund. Throughout the whole of its length the Hailakandi valley is shut in between two ranges. The first section in the south-west is known as the Chhatachura range, and starts from the peak of that name, whose summit is 2,087 feet above the level of the sea. The hills gradually decline in height, and the middle section, which bears the name of Saraspur, is only 1,000 feet above sea-level, while near the Barak, where they are known as the Badarpur hills, they are only a few hundred feet in height. A little to the east of the Chhatachura Range runs another and outer range of much lower hills, different sections of which are known as the Katlicharra, Alexandrapur, and Latakandi hills. South of Jafirbund almost the whole of the Hailakandi subdivision east of the Dhaleswari is dotted over with low hills, but the actual range, which stretches northwards from the southern frontier of the district to the Barak and bounds the Hailakandi valley on the east, is known under the following names going from south to north: Jhalnachara, Barunchara, Rupachara, Nunaikhal, Hasiura, Kalachara, Bandukmara, Mohanpur, and Rabatabad hills. North of Jafirbund these hills are very low, and the different sections of the range are separated from one another by considerable intervals of level land. The Bhuban range and the hills to the south of the Hailakandi valley are covered with forest and dense bamboo jungle, and take the form of narrow ridges with steeply

sloping sides which here and there bristle into peaks. North of the Barak the outlying spurs of the Assam range have level summits covered with a rich and fertile soil. Many of these hills have been cleared and planted out with tea, and tea is also grown on the low hills or *tilas* which are dotted about over almost every portion of the plain except the valley of the Sonai.

The principal river of Cachar is the Barak, which rises a little to the east of Mao thana, on the southern slopes of the lofty range which forms the northern boundary of Manipur. From there it flows a westerly and southerly course to Tipaimukh, when it turns sharply to the north, and for a considerable distance forms the boundary line between Cachar and Manipur. After its junction with the Jiri, it turns again to the west, and flows a tortuous course across the centre of the district till Sylhet is reached at Badarpur. From Badarpur to Haritikar the Barak forms the boundary between the two districts, but at the latter place the river divides into two branches, and the southern arm, which is known as the Kusiya, crosses the frontier of Sylhet. The northern branch, which is called the Surma, continues to form the boundary of Cachar as far as Jalalpur. The total length of the Barak from its source to its confluence with the old stream of the Brahmaputra near Bhairab Bazar is about 560 miles; but of this only 120 miles lie through or on the borders of Cachar. In the cold weather the Barak is in places extremely shallow, and the river flows between steep banks which rise to a height of 40 or 50 feet on either side. After heavy rain in the hills it is subject to strong freshets, and the

Riversystem.
The Barak.

level of the water sometimes rises 20 or 30 feet in a surprisingly short space of time. The extent to which the river is used as a waterway will be discussed in the section on communications.

The Jiri.

The Barak receives numerous small tributaries from the hills through which it makes its way, but the Jiri is the first important affluent to join it in Cachar. This river rises in the North Cachar Hills, and flows a course of 75 miles to its confluence with the Barak, during the greater part of which it acts as the boundary line between British territory and Manipur. Its principal tributaries are the Jhinam, and the Digli or Kumruna, which drain the hills immediately to the west.

**The Chiri
and
Madhura.**

A little to the west of Lakhipur the Barak receives the Chiri or Longkhao which rises on the southern slopes of the high range near Haflang. The next important tributary is the Madhura or Bongpai which joins it a little to the west of Silchar town.

The Jatinga.

The Jatinga river is well known as the railway line has been carried up its valley. It rises south of Haflang and flows west and south through the hills till it debouches on the plain at Panighat. From here it flows through the Barkhala pargana, and after receiving the Doloo on its left bank, falls into the Barak nearly opposite Jaynagar, after a course of 86 miles. West of the Jatinga there are numerous small streams which drain the country south of the Barail, but are of little importance except as drainage channels.

The Sonai.

The principal rivers on the south are the Dhaleswari and the Sonai. The latter rises in the Lushai Hills

and after a tortuous northerly course of 60 miles, falls into the Barak at Sonaimukh. As far as Maniarkhal it flows through forest land, but from this point to its mouth its banks are fringed with villages.

The Dhaleswari also rises in the Lushai Hills where ^{The Dhaleswari.} it is known as the Tlong. It used originally to flow along the west side of the Hailakandi valley, and fall into the Barak a little to the east of Badarpur. A former Raja of Cachar is said to have diverted its course a little above Rangpur, and the old channel is now filled up for a distance of about one mile after the commencement of the new channel, which is called the Katakhal. In spite of the fact that the lower reaches of the Dhaleswari are completely cut off from the river that issues from the Lushai Hills, the bed still contains a considerable quantity of water, and between June and September a boat of four tons burthen can proceed above Hailakandi town as far as Ainakhal. The Katakhal flows along the east of the valley and falls into the Barak near Salchapra. The banks are steep and high and the channel of the river deep, but it is liable to sudden freshets, which occasionally do some damage to the villages in the neighbourhood, and small embankments have been erected on two or three gardens to prevent the spill water from injuring the tea. The country between the Sonai and the Katakhal is drained by the Rukni, a tributary of the former river, and the Ghagra which falls into the Barak.

North of the Barail the principal drainage channel is ^{The northern rivers.} the Doiang, which rises near the Mahur station and flows a tortuous course through the centre of the subdivision. From its junction with the Langpher river near

Lamsakhang it forms the northern boundary of the district till it falls into the Kapili, which for the greater parts of its course acts as the western boundary of the North Cachar Hills. The principal tributaries of the Doiang are, on the left bank the Dalaima, the Langlai, and the Langyen. On the right bank it is joined by the Mahur; with its tributary the Mupa, and the Langting. During their passage to the plains these rivers present the phenomena usually to be observed in hill streams. The channel is full of rocks and boulders, which, in conjunction with the rapidity of the current, render them useless for the purposes of navigation. The rivers roar their way towards the lower levels, but, though they add much to the charm of the surrounding scenery, and carry off the rainfall of the hills, they do not as yet contribute anything towards the material development of the country.

General
appearance
and
scenery.

The general appearance of the Cachar Plains is extremely picturesque. On the north, east, and south they are shut in by range upon range of purple hills whose forest-clad sides are seamed with white landslips and gleaming waterfalls. There are none of those wide stretches of unbroken plain, which form so tedious a feature in the landscape in many parts of India. Low hills crop up here and there above the alluvium, rising like rocky islets out of a summer sea; and in one direction or another mountains always bound the view. To the south much of the country is still covered with primeval forest. Further north the higher land has been cleared and planted out with tea, while the lower levels are covered with rich crops of waving rice. Here and there

swamps and *bils*, with clumps of elephant grass and reeds, lend variety to the view. The Barak winds through the centre of the plain, its surface dotted with the white sails of native craft, and its banks for the most part lined with villages. These villages are buried in groves of slender areca palms, broad-leaved plantains, and feathery bamboos, and at all seasons of the year the country looks fresh and green. The hills in North Cachar rise as a rule in steep slopes, covered with forest and bamboo jungle, but rocks and precipices are seldom to be seen.

The following description of the marshes of Cachar, ^{Bills.} which is taken from Sir William Hunter's work,* is stated by the Deputy Commissioner to be still substantially correct. The process of silting up has, however, advanced considerably during the last twenty years, and in the Bakri *haor* high ground has been formed on which permanent villages have been established. In addition to the ones mentioned by Sir William Hunter there are the following large *bils* in the Hailakandi subdivision: Bawa, 2 square miles; Churgul, 2 square miles; Kuliala, 1 square mile; Chunati, $\frac{1}{2}$ square mile.

There are no artificial watercourses or lakes in Cachar District; but the Chatla Fen, during three or four months of the rainy season, swells into a lake-like sheet of water, navigable by the boats which supply rice to the neighbouring tea plantations. It is difficult to give an estimate of the area of this piece of water, as it varies much from year to year, and it is not easy to determine where the actual *bil* begins and where marsh-jungle ends. Its dimensions may, however, be approximately stated to be about 12 miles in length, and

* "A Statistical Account of Assam," Vol. II, page 367.

two miles in breadth at the widest part. The Chatla Fen plays so important a part in the physical geography of Cachar, that an account of it as it appears in the rainy season, and of the land-making process which is steadily going on in its swamps, may not be found uninteresting. The Barak river enters Cachar from the east as a considerable stream, overcharged with silt; and in its course through the district it receives the torrents from the Naga Hills on the north, and the Lushai territory on the south. As soon as the periodical rains set in, both the Chatla and the Hailakandi valleys turn into swamps. For a time they manage to discharge a good deal of their water into the Barak; but as this river receives its freshes from the eastward, it rises above the level of the two valleys, and instead of relieving them of their drainage, pours its own floods into them. Its rise and fall are so sudden, that within 24 hours the direction of the water changes, and the current, which in the morning was streaming out of the marshes into the river, comes rushing back into the fen before night. The outward stream is of the clear brown colour of marsh water, which is charged indeed with organic matter, but has deposited in the swamps *en route* whatever silt it brought from the Lushai Hills. On the other hand, when the Barak rises above the level of the fen, it sends a thick, muddy torrent out of its main channel, heavy with silt, and the colour of pea-soup. The inundation spreads over the vast expanse, swelling the marshes into a wide and deep lake, from which rise little conical isolated hills, with trim rows of tea bushes on their slopes, the coolie lines half-way up, and the planter's neat mat cottage on the summit. Everything else is submerged, except here and there a grove of *higil* trees, whose dark green tops stand up like laurel bushes above a depth of 15 feet of water. As long as their highest branches can breathe the air, these trees will bear any amount of inundation. When the river subsides, the stream again turns from the fen into the Barak. But meanwhile the muddy river water has deposited its silt, and gradually passed through a pale straw colour into a light or deep brown. It leaves behind it a layer of fresh slime, and by innumerable repetitions of this process the bottom of the fen gradually rises. The fishermen say that in some places the depth of water in ordinary floods decreases at the rate of 18 inches every ten years. The process of land-making thus goes on, age after age, the lakes gradually shallowing into fens, the fens into reedy swamps, and the swamps into marshy prairies, covered with coarse grass. At present the Chatla fen exhibits the process in all its stages.

It now contains about 60 deep pools, or *kuris*, in which the filling-up stage has not yet gone far enough to admit even of the longest-stemmed aquatic plant rising to the surface. These pools, the fishermen say, were formerly 90 in number, but many of them have passed into the fen stage, and almost all of them have grown shallower within the memory of a single generation. Meanwhile the shallow marshes slowly rise up into dry land, offering rich crops for the most careless tillage. At the end of the rainy season the dry land emerges in mud and wild disorder. As far as the eye can reach, all is unformed chaos; and in riding across it in the cold weather, one might expect to see a megatherium, or other vast pre-Adamite monster, slide down some slimy bank into the quagmire. Quagmires, indeed, form a typical feature in the landscape. The traveller suddenly comes upon a patch of bright green vegetation, which the unwary might mistake at a little distance for luxuriant grass, but which the more experienced at once recognises as a deep and treacherous quagmire. During the rains sudden whirlwinds sweep across the fen, and, although of brief duration, blow with tremendous violence while they last. The unfortunate boat which has trusted to the shortness of its voyage to enable it to dispense with an anchor, has no resource but to drive helplessly before the storm till it sticks in a reedy marsh, or can fasten itself to its punting poles by fixing them into the shallow mud of a rice-field. Sometimes little fleets of grain barges are thus dispersed in the fen, and are carried by the force of the wind over roods of shallow water, which they find it afterwards impossible to recross without unloading. In the cold weather the ground is broken up by cracks, ravines, beds of silted-up rivers, muddy holes, and quagmires.

Besides the Chatla fen, the following are the other more important marshes in the district, with their estimated area:—
(1) Bakri *haor*, area 10 square miles; (2) Bowalia, 6 square miles; (3) Dubri *bhil*, 1 square mile; (4) Koya, 1 square mile; (5) Karkaria *bhil*, $\frac{1}{2}$ square mile; (6) Thaphani *bhil*, 4 square miles.

The following account of the geological formation **Geology.** of the North Cachar Hills has been given by Mr. De La Touche* :—

“Beyond the limestone ridge to the south-east of the hot

* Records of the Geological Survey of India, Vol. XVI, pt. 4, p. 202.

springs upper tertiary rocks extend in an unbroken mass to the Barail range above Asalu. As far as the police outpost of Gunjong these rocks are horizontal, or nearly so, consisting of fine grained sand-stones and shales. It is in the valley of the Mahur, to the east of Gunjong, that the change from the generally undisturbed condition of the newer rocks on the Shillong plateau takes place, the upper tertiary rocks to the east being everywhere greatly disturbed. The transition does not take place so abruptly as on the southern edge of the plateau, where the newer rocks are bent down suddenly in a uniclinal curve into the area of disturbance; but it is well marked, the rocks at Gunjong having a slight inclination to the east, while in the Mahur Valley they are sharply contorted, and at Kuilong on the opposite side are nearly vertical."

The Chief Engineer engaged on the construction of the Assam-Bengal Railway reported that for the first 80 miles after leaving the Cachar Plains the line ran through shale of the worst description, often intermixed with bands of kaolin. The latter substance swells on exposure and causes heavy slips, and exerts immense pressure on the sides of tunnels, and the difficulty and expense of the construction of the railway was largely increased by the character of the strata through which the line was made. The soil of the plains is of alluvial origin and consists of a mixture of clay and sand in varying proportions: the hills to the south of the district have never been properly explored, but they probably resemble those inhabited by the Lushais.

Mineral
deposits.

Lime is found on a tributary of the Langting to the north-east of Maibang station. The rocks here are shales dipping at 20° to the north-north-west, and the stream has deposited a bed of calcareous tufa on the upturned edges of the shales. The deposit is of small extent and has nowhere a greater thickness than two feet. Similar deposits have been found in the valleys near Gunjong.

The Subdivisional Officer of North Cachar reports that outcrops of lime-stone are also to be seen in the country between the Doiang and Kapili, in the valleys of the Amram and Langyam streams, and at Sinkilangso, Langhuha, and other places. Neither iron nor coal are worked within the hills. Petroleum has been found at Masimpur and Badarpur on the banks of the Barak, and on the Larang, a small stream which rises to the north of Damcharahaju. Traces of it have also been seen at various places in the Saraspur hills. Salt springs exist both in this range, the Bhuban hills, and the Barail, but are only worked near Bansbari and Chandipur in the north-west corner of the Hailakandi valley. The springs are leased annually for a trifling sum, and the brackish water is sold to the people in the neighbourhood. There are hot springs on the right bank of the Kapili near Panimur.

The climate of Cachar is not so pleasant as that of Climate. Upper Assam. The rainfall is extremely heavy, but the temperature in the rains is considerably higher than that recorded in Dibrugarh, and the winter is not nearly so cold and bracing as in the northern valley. The average maximum temperature in January is under 78° Fahrenheit, but this is nearly 7° higher than that recorded in Dibrugarh, and, though the mornings are cold and sometimes foggy, the sun at midday and in the early afternoon has still considerable power. In March the temperature begins to rise, but heavy rain in April and May prevents the development of anything in any way resembling the hot weather of Upper India. Between June and September the climate is far from pleasant. The average maximum temperature during

this period is nearly 90° , the average minimum nearly 77° , and though these temperatures in themselves cannot be considered high, they are most oppressive in an atmosphere surcharged with moisture. During these four months no less than 78 inches of rain fall at the headquarters of the district, and, shut in as it is on three sides by hills, the air of the plain resembles that of a vapour bath. In October the nights begin to grow a little cooler, but the sun is still very hot in the middle of the day, and it is not till the middle of the following month that the cold weather can be said to have regularly set in. The average maximum and minimum temperature recorded each month at Silchar will be found in Table I. In almost every month there is a marked difference between the temperature of Silchar and Dibrugarh, and the average maximum for the year at the latter place is 5 degrees, and the average minimum 8 degrees lower than that recorded at Silchar.

Rainfall.

Table II in the appendix shows the rainfall recorded at certain selected stations in the district. The average annual fall at Silchar is 121 inches, but near the foot of Assam Range it is not far short of 170. The storm clouds sweeping up the valley are, however, stopped by the Barail, and it is on its southern slopes that most of this aqueous vapour is precipitated in the form of rain. At Haflang, immediately to the north of this wall of hills, there are but 77 inches in the year, and at Maibang the annual fall is as little as 55 inches. November to February are the only four months in the year that can be considered dry, as the spring rains are unusually heavy. In March Silchar receives nearly 8 inches, in

April nearly 14, and in May no less than 16 inches; and this before the bursting of the regular monsoon. June and July are generally the wettest months in the year, but August runs them very close.

At Silchar the wind generally blows from the north-east in the morning and from the south-east in the afternoon. About the end of February stormy weather sets in, and in March there are often thunderstorms, and not unfrequently heavy falls of hail which do much damage to the tea. In April and May these storms become less violent, and at no season of the year do they assume the form of cyclones or tornadoes.

Storms and
earth-
quakes.

Cachar, like the rest of Assam, is a seismic area, and considerable damage was done by the shock which occurred on January 10th, 1869. This earthquake was felt in Upper Burma, and as far to the west and south as Patna and Hazaribagh, over a total area of some 250,000 square miles; but Manipur and the eastern end of the Surma Valley were the places that suffered most severely from this visitation. Dr. Oldham, who enquired into the circumstances of this earthquake, was of opinion that the shock probably originated in a fissure about 20 miles long, situated at a considerable depth below the surface on the northern border of the Jaintia Hills. The serious damage wrought in Silchar was due to the fact that the town is situated on a peninsula washed by the Barak river, and to the abnormally high angle of emergence.* The shock occurred at 4-45 P.M. on a cool winter's day, in which there was nothing to suggest the

The earth-
quake of
1869.

* Memoirs of the Geological Survey of India, Vol. XIX Pt. I, p. 65 and 70.

approach of any unusual visitation. One eye-witness describes the gradual development of the earthquake in the following terms: "It came on with a gentle undulating movement, which, however, rapidly increased, until neither men nor animals could keep their legs but were thrown down, and such things as bottles, glasses, lamps, were upset, and the *gumlas* were half emptied of water. The water in tanks and rivers was violently agitated, and the Barak rose in huge waves, and wrecked numbers of boats. The landslips caused were numerous and extensive, and many homesteads were carried down the stream." The jail wall, the church tower, the cemetery gates, and the military hospital were all thrown in ruins to the ground. The Deputy Commissioner's bungalow was also wrecked, but this was probably due to the fact that some of the posts in the verandah had been removed in order that they might be replaced by newer timbers, and the bungalows in the neighbourhood sustained but trifling injuries. The Bazar was a scene of utter desolation. Bamboo and mat houses, which elsewhere had remained standing, were here wrecked as hopelessly as the masonry buildings with which they were interspersed. This was due to the fact that they were built near the river's bank which subsided under the influence of the shock, and was broken up into crevasses and fissures. The houses were not shattered by the tremor of the earth, but by the unequal subsidence of the land on which they stood. Luckily the earthquakes occurred in the day-time, when the people were out of doors, or could leave their houses without difficulty, and only six lives were

lost.* In the newer alluvial deposits the earth was broken up into cracks and fissures, and sand and muddy water spouted forth.

The great earthquake of June 12th, 1897, was sen- The earth-
quake of
1897.
sible over an area of 1,750,000 square miles, while the area over which it is known to have done serious damage to masonry buildings was not less than 145,000 square miles; but Cachar was fortunate enough to escape with comparatively little injury. The earthquake is said to have occurred about 5-20 P.M., and the shock was less severe than that experienced in 1869. Hardly any damage was done to buildings in Silchar, but the residence of the Subdivisional Officer and the dak bungalow, both at Hailakandi and Haflang, were rendered uninhabitable. Fissures appeared in the soil, and in the Katigara tahsil houses and land in the neighbourhood of the Barak subsided into the river. Some damage was also done on tea-gardens, and altogether three lives were lost. Little damage was done to the unopened section of the railway in the North Cachar Hills, but the bridges between Badarpur and Silchar sustained serious injuries. Nine of the eleven piers which supported the bridge across the Katakhal were thrown down, and the bridges across the Dhaleswari and the Ghagra were also damaged.

Wild animals include elephants, which are generally Fauna.
found in the hills to the south of the district, buffalo

* Somewhat exaggerated accounts have been published of this earthquake. It has been said that "The church, which was in course of building and nearly finished, was levelled with the ground. Nearly all the buildings, including the Government offices, were destroyed wholly or in part." As a matter of fact, it does not appear that the walls of the Church were even cracked, while the injury to the Government buildings was inconsiderable.

and bison, which are found in the North Cachar Hills, tigers, leopards, bears, and various kinds of deer. For the purpose of elephant hunting, the district is divided into two mahals. The right to hunt in these mahals is put up to auction, and, in addition to the auction price, the purchaser is required to pay a royalty of Rs. 100 on each animal captured. In the three years ending 1908-04, forty-six elephants were on the average annually captured. The larger carnivora are no longer common in the plains, and in 1904 rewards were only paid for the destruction of 17 tigers, 16 leopards and 86 bears. Small game include snipe, wild geese and duck, pheasants, partridges, and jungle fowl.

CHAPTER II.

HISTORY.

Traditional origin of Kacharis—Wars between Kacharis and Ahoms—Migration to Maibang—Migration to Cachar Plains—The eighteenth century. Approach of British—Conversion to Hinduism—Invasion of Cachar from Manipur—Restoration and death of Gobind Chandra—Native System of administration—Pemberton's description of Cachar—Revenues of Kachari Raja—Tula Ram Senapati's territory—Development of the Cachar Plains—Destruction of mutineers in 1857-58—Sambhudan's rising in 1882—Frontier troubles—The Lushai raids—Murders at Baladhan—Archæology.

THE Kacharis of Cachar, or Dimasa, as they call themselves, are generally supposed to be a section of the great Bodo horde. This populous and powerful race is said to have had its origin somewhere between the upper waters of the Yang-tse-kiang and the Hoang-ho, to have spread in successive waves over Assam, and to have even penetrated as far south as the Tippera Hills. Mr. Dundas, lately Subdivisional Officer of North Cachar, reports that an old prayer is still in use amongst the Dimasa which refers to a huge *pepul* tree growing near the confluence of the Dilao (Brahma-putra) and the Sagi. It was here, according to the prayer, that they were born and increased greatly

Traditional
origin of
Kacharis.

in numbers, and from here that they travelled by land and by water to Nilachal, the hill near Gauhati on which the temple of Kamakhya stands. From Nilachal they moved to Halali, and finally settled at Dimapur. Copper-plates which have been recently discovered, and which are ascribed to the tenth and eleventh centuries A.D., state that the descendants of Narak, one of the earliest kings of Kamarupa, were overthrown by Cala Stambha, a Mleccha or foreign conqueror. Cala Stambha was succeeded by twenty other foreign kings, and the line of Narak was then restored in the person of Brahma Pala.* It thus seems possible that the Dimasa may for a time have ruled at Gauhati, and may have been driven from there eastwards into the valley of the Dhansiri. When the Ahoms entered the Assam Valley in 1228 A.D., the Dimasa occupied the western part of Sibsagar, and a considerable part of Nowgong in addition to the valleys of the Kapili and the Dhansiri.

Wars
between
Kacharis
and Ahoms.

The first collision between the Kacharis and the Ahoms is said to have taken place in 1490 A.D., on the banks of the Dikho river.† The Kacharis were victorious and killed 120 of the enemy, and the Ahoms offered a girl, two elephants, and twelve slaves to induce them to make peace. In 1524, the Kacharis again raided into Ahom territory, but were repulsed, and the Kachari Raja gave his sister in marriage to the Ahom king. There was little loss of life on this occasion, but an expeditionary force sent up the Dhansiri two years later

* Vide J.A.S.B., Vol. LXVII, Pt. I, No. 1, 1898, p. 99.

† The story of the Ahom and Kachari wars has been taken from the Ahom *buranjis*, translations of which will be found in the Office of the Superintendent of Ethnography.

succeeded in killing upwards of 1,700 of the Kacharis. In 1580, Detsung, the Kachari Raja, is said to have offered his sister in marriage to the Ahom king, and to have sent with her as dowery an elephant, 500 swords and cloths, 1,000 napkins, 100 doolies, and Rs. 1,000 in cash; but it was evident that there could be no permanent peace with such an aggressive neighbour. In 1586, hostilities again broke out. Detsung was defeated and his capital was sacked, and the Kacharis were shorn of all their possessions in the valley of the Dhansiri, and north of the Kalang in Nowgong.

Raiding parties continued to be sent into the Ka-
Migration to
Maibang.
 chari country, and it was probably about this time that the king decided to abandon Dimapur, and moved his capital south-west to Maibang on the Mahur river, in the hope that the Ahoms would be unable to follow him through the jungle-covered hills to his new abode. The remains of brick ruins, rock sculptures, and dense groves of bamboos show that Maibang must once have been a thriving place, but the Raja was wrong in supposing that he had passed beyond the sphere of Ahom influence. In 1706, Rudra Singh, one of the most powerful of their princes, despatched an expedition into the hills. The army numbered no less than 37,500 men, and the Kacharis were unable to withstand the attacks of such a powerful force. Maibang was taken and sacked, the spoil including a brass cannon, 700 flint guns, 240 maunds of sulphur, 140 iron shields, 6 large copper drums and 4 tusks.

The Kachari Raja fled southwards to Khaspur,
 and, hearing that the Ahom troops had suffered severely
Migration to
Cachar
Plains.

from sickness during the rains, applied to the Jaintia Raja for help to recover his lost territory. The latter prince persuaded the unfortunate monarch to proceed to Bikrampur, where he met the prime minister of the Jaintia State. He was then induced to advance to the Barak, and to enter a boat in which the Jaintia king was said to be reposing. Needless to say there was no such person there, and the Kachari prince was made captive and removed to Jaintiapur. Both he and the members of his family were treated with scant courtesy, and the Jaintia king proclaimed himself sovereign of the Kachari country. Means were, however, found of applying to the Ahom king for help, which was not refused. A strong force was sent through both the North Cachar and Jaintia Hills, which captured both the princes and conveyed them to the Brahmaputra Valley. The list of spoil obtained, if it is correct, shews that the Kachari king must have been a person of some wealth and power. It included 8 large cannons, 2,278 large and small guns, 12,000 pieces of silver, 143 gold embroidered coats, 68 elephants, and 11 Turkey horses. The opportunity was also taken of removing back to Assam some 1,600 persons who had fled into the hills at the time of the Koch and Muhammadan invasions, or had been kidnapped by the Kacharis. The two captive princes were kindly treated by the Ahoms. The Kachari king was stationed near Bishnath, and was finally sent back to his own country, with ten elephants, and a supply of guns, gun-powder, and other implements of war. He took up his abode at Khaspur, but shortly afterwards was attacked by a mortal disease, and though the Ahom king sent three physicians

across the hills to prescribe for his sick friend, he breathed his last in 1708 A.D.

He was succeeded by his minor son, who on his accession sent a horse, a string of pearls, and a locket to his suzerain. When dismissing the envoys who had brought these gifts, the Ahom king, according to the old chroniclers, gave the following summary of the relations between the two states:—

*Kacharis
subject to
Ahoms.*

“The previous rulers of Cachar were under our protection and paid us tribute. The father of Suradarpa, the present prince, forgot this fact and had to pay the penalty of his forgetfulness. I take this opportunity of reminding his son that he must be both faithful and loyal, and must punctually submit reports to a Borborna who has been posted at Raha to hear all complaints from the Kachari kingdom. These reports will be sent on to me, and I shall pass such orders as seem fit.”

Mr. Soppitt gives 1750 as the year in which the Kacharis migrated to the plains of Cachar, and states that it took place in the reign of Suradarpa's successor Dharmadwaj, or even in that of the next prince Kartik Chandra.* Two reasons are assigned for this migration: one that Dharmadwaj had married the daughter of the Raja of Hill Tippera and had received the upper valley of the Barak as her dowery; the other that the Kacharis were attacked by the Jaintia Raja on the west. The account given in the Ahom chronicles seems to be the more plausible. It was only natural that the Raja, having been once driven to the plains by the Ahoms, should remain there in preference to returning to Maibang, to a palace which had been destroyed, and to a town that had been sacked. Aggressions from Jaintia would seem

*Other
versions of
migration to
the plains.*

* An historical and descriptive account of the Kachari Tribes in the North Cachar Hills, by C. A. Soppitt, Shillong Secretariat Press, 1885, page 4.

to be a very inadequate reason for moving into a portion of the Surma Valley which adjoins the Jaintia Parganas, and which is eminently accessible from Jaintiapur. Mr. Soppit is inclined to doubt the story of the Cachar Plains having formed part of the dowry of a Tippera princess; and if they did, the Tipperas seem to have soon required their own again. In 1757, envoys from the Kachari Government came to the Ahom king and complained that the Tipperas were devastating their territory; the Raja had fled to Mekheli, his uncle to Maibang, and the officers and nobles had taken refuge in the jungle. Cachar was a tributary state, and as such should be protected against invasion from without. An expedition, so the Ahom chronicles says, was despatched; but very little was done, and the Tipperas no doubt retired in their own good time.

The 18th
Century.
Approach of
British.
Conversion
to Hindu-
ism.

Little is known of the history of Cachar during the eighteenth century. The section of the Kachari tribe that moved into the Surma Valley or remained in the hills of North Cachar was numerically small, and, in 1901, there were only 8,708 Kacharis in the hills and 4,152 in the plains of the district. Settlers moved across the border from Sylhet, and refugees poured into the state from Manipur; but even in 1885 the total population of the Cachar Plains was only estimated at 50,000 souls.* The Kachari Raja seems in fact to have sunk to the position of the petty ruler of an unimportant tribe, living in a remote and jungly tract. The first connection of the British with the district dates from 1762, when Mr.

* Report on the Eastern Frontier of British India, by Captain Pemberton, Calcutta, 1835, page 199.

Verelst marched from Chittagong with five companies of foot, to assist the Manipur Raja who had been driven from his throne by the Burmese. They reached Khaspur and remained there for nearly a year, but were prevented by the difficulties of the country from going further, and were finally recalled. The next historical event of importance was the formal conversion of the Raja Krishna Chandra to Hinduism in 1790 A.D. He and his brother Gobind Chandra were placed inside the body of a large copper cow, and thence produced by the Brahmans who declared them to be Hindus and Kshattriyas, and to be the descendants of a union between Bhima, the hero of the Mahabharata, and a rakshashi whom he espoused in the Nambar forest. The people followed the example of their prince, and nearly all the Kacharis in the district now describe themselves as Hindus. A list of the Kachari kings will be found on page 408 of the second volume of Hunter's Statistical Account of Assam, but all except the last few names are merely the inventions of the Brahmans.

In 1809, Krishna Chandra, who was Raja at that time, allowed himself to be entangled in the web of intrigue that has always surrounded the throne of Manipur, with results that were fatal to his own small principality. Madu Chandra, the Raja of Manipur, had been driven from his throne by his two brothers Charjit and Marjit. He applied to the Kachari Raja for aid, which was afforded him, but was killed in the attempt to regain his crown. Charjit and Marjit then fell out, and Marjit was compelled to retire to Cachar, taking with him a hockey pony of quite exceptional

*Invasion of
Cachar from
Manipur.*

excellence. Gobind Chandra, the brother of the Kachari Raja, was siezed with a strong desire to possess this pony, and when his offers to purchase were refused, took possession of the animal by force, in defiance of the wishes of the owner. Marjit left Cachar in anger and applied to Burma for assistance, and, with the aid of the Burmese, drove his two brothers Charjit and Gambhir Singh from Manipur in 1812 A.D. Charjit took refuge in the Jaintia Hills, and, when Marjit invaded Cachar in 1818, he came to the assistance of Gobind Chandra. Marjit was compelled to retire, but Charjit and Gambhir Singh remained in possession of the greater part of the Cachar plains. In 1819, Marjit was driven by the Burmese from Manipur, and took up his quarters in the Hailakandi valley.

Restoration
and death of
Gobind
Chandra.

The Burmese then expressed the intention of adding Cachar to their dominions, but the British Government were unable to acquiesce in the suggestion that such a powerful nation should extend its territories right up to the frontiers of Sylhet. Negotiations were entered into with the Manipuri usurpers, but Gambhir Singh, thinking that he would be able to protect his territories from invasion without the assistance of the British, refused to entangle himself in an alliance which might afterwards prove fatal to his independence.

The British Government then turned to Gobind Chandra, expelled the Burmese, and seated him once more upon the throne. In return for this assistance he was required to pay an annual tribute of Rs. 10,000, which must have proved a somewhat heavy drain upon the resources of the country. The Raja took up his

abode at Haritikar, but in 1880 he was assassinated by the orders of the Manipuri Raja Gambhir Singh.* In the absence of natural heirs his territory lapsed to the British, under the terms of an agreement executed in 1826. The district was formally annexed by proclamation on August 14th, 1882.

The following account of the Cachari system of administration is reproduced from the Statistical Account of Cachar by Sir W. W. Hunter :—

Native
system of
Administra-
tion.

“ From their arrival at Kashpur the distinct history of Cachar commences. Numerous colonies of Bengalis, who came up the Barak valley from Sylhet, had meanwhile planted their first settlements on the northern side of the river, shortly after passing the Sylhet frontier. It is supposed that Musalman Bengalis also migrated into Cachar about the same time. At first the new-comers seem to have simply cleared land as stray settlers, paying rent to the Cachari Raja. By degrees, as they became stronger, they obtained from the prince a sort of constitution, which protected them from interference on the part of Cachari tax-gatherers and court officials. Thus, when the British took possession of the District in 1880, they found two distinct systems of administration in existence. One of these, dealing with the Cachari subjects, consisted of a long gradation of officials, who held appointments which would have involved a minute control over the subjects, but for the circumstance that there were hardly any subjects to control. The only people subject to their immediate authority were the uncivilised hill tribes of Parbattias, Cacharis, Kukis, Nagas, etc. Among these officers were a Bara Bandari (chief law-man), with a large establishment of subordinate law-men; a Senapati or general, with a number of superior officers, not quite so titular as the law-men; also a religious establishment of Cachari Barmans, to perform sacrifices for the health of the king and the safety of the people. These sacrifices were handed down from primitive

* Mr. Ware Edgar in the Dacca Blue Book (page 358) states that the Manipur Raja was responsible for the assassination. Mr. Soppitt (page 9) attributes the murder to Gumar Singh, at one time general of the Cachari troops, who quarrelled with the Raja and fled to Manipur, where he organized a raid.

times, and could only be performed by the descendants of the native Cachari priests. Among them was a human sacrifice for the Raja, celebrated on certain great occasions.

Hindu Agricultural Communities.—The Bengalis, on the other hand, were almost independent of these officers. Their great aim here, as elsewhere, was to keep themselves a peculiar people. They sought only for as much influence at court as would secure them from interference. They had a constitution of their own, based on a revenue system now peculiar to Cachar, which is perhaps a vestige of the once great Cachari kingdom. The fundamental principle of this system was the holding of land by a number of persons connected by voluntary association. The unit of the system was the *khel*. Just as in Hindu communities the village forms the basis of the agricultural commonwealth, which is bound together, theoretically or practically, by ties of kindred and caste, so the *khel* formed the unit of the agricultural community of Cachar, but its members were not connected by any ties of kindred, caste, nationality, or creed. From the first, Musalmans and Hindus are found side by side in the same *khel*; and now that this principle of voluntary association has extended to other enterprises, no bar of race or creed is opposed to the admission of any part of the population. Thus there are instances of associations for leasing fisheries or catching elephants, which include not only Bengalis of every caste and creed, but Kukis, Nagas, and even Europeans. When the Manipuris began to settle in Cachar, they were at first inclined to be exclusive, and to associate in taking land only with their own race. But since our accession they have fallen into the general scheme, and now a Manipuri often takes a lease along with a Musalman or a Hindu, to the exclusion of a man of his own race, who may be objectionable on account of his temper or character. The principle of association is, therefore, purely commercial. It is a voluntary copartnership of a number of persons for the purpose of carrying on a specified undertaking, acknowledging no other nexus except community of interest. This nexus does not even extend to community of capital or of profits, for as soon as the common lease is obtained, the land is divided by the partners amongst themselves, and each sets up for himself on his own allotment. * * * * * But although the nexus was weak as between the individual sharers, it was absolutely inseparable as regards their obligations to the ruling power. These obligations consisted in, firstly, the payment of the revenue, and, secondly, the discharge of certain customary services. The latter included the supply of labour for the Raja's works, and of necessaries to him on his progress. * * *

* * * The first common obligation, that of paying the rent, still remains.* This was originally done by means of an agent (*mukhtar*) appointed by the sharers and confirmed by the sovereign. He was generally the leading man and principal sharer in the corporation, and seems to have been primarily responsible to the Raja for the rent. That is to say, if he came up to court with a deficient payment and a lame excuse, he was the man on whom the royal wrath fell, and who was squeezed in the first instance, before steps were taken against the corporation.

In course of time, as the number of *khels* increased, groups of adjacent *khels* were joined together into larger unions, marking the second stage in the development of the principle of voluntary association in the Cachar revenue system. The larger union was called a *raj*; and as each *khel* had been represented at court by its principal sharer as agent, so each *raj* elected the principal man in it, or the head man of the chief *khel*, as its own representative. In both cases the Raja's approval was required, and a title seems usually to have been conferred on the officer who represented the *raj*. These titles were of Bengali origin. The representative of the larger union was entitled either *chaudhari*, *mazumdar*, *lashkar*, *bara-bhuiya*, or *chhota-bhuiya*, according to his social status, and the comparative importance of the union he represented. Of these titles, the only one requiring notice is *lashkar*, which extends far up into the Garo Hills, where the head-men of agricultural villages are called by the same name. These titles originally clung to the land and its representatives, but before we obtained possession of the country they had become transferable at a fixed scale of prices. The title of *chaudhari* fetched £10; that of *mazumdar*, £8; that of *lashkar*, £6; *bara-bhuiya*, £5; and *chhota-bhuiya*, probably £4. The titles were hereditary, and descended to all the sons and their descendants. By degrees the unions began to separate into classes. Those that paid their whole rent to the Raja were called *khelma*, and their representative *khelma lashkar*, or *khelma chaudhari*. The general process was, that the sharers in each guild or *khel* paid their portion of the rent to the *khel-mukhtar* or agent. Each *khel-mukhtar* paid the total rent of his *khel* to the *raj-mukhtar*, who in his turn paid it to the Raja at the royal residence. The office of *mukhtar* or agent was theoretically elective, and at first no doubt the holders of it were actually elected. By degrees,

* The copartnerships were broken up at the last settlement and individual leases issued.

however, the office became hereditary, either the eldest son or next male relative succeeding with more or less show of election.

By the development of this system, the Bengalis practically obtained a constitution, which in quiet times was sufficient to preserve them from all interference on the part of the royal officers. In the first place, it secured them from the visits of the revenue officials. Once the lease was given, and the *khel* or agricultural guild was established, the sharers had an elective organization of their own for collecting the rent and for depositing it in the royal treasury. As their representatives were primarily responsible in their persons for the rent, and no doubt were often imprisoned, or otherwise made to appease the royal indignation, in case of default, they probably assumed petty powers, judicial and fiscal, with a view to providing against the contingency of default, and of forcing the individual guildsmen to pay up their shares. At all events, the fact remains that they did acquire such powers, and at the date of the British occupation they appear in the light of an unpaid magistracy, with fiscal and communal powers. All were alike subject to the sovereign, and each derived his title from him. But the fiscal gradation of guild representation was carried into the unpaid magisterial service, the guild representative being inferior in his criminal functions to the union representative, if indeed he had any acknowledged and properly conferred powers at all. At the head of all was the League Representative of Bikrampur, the first Hindu subject of the Cachari Raja. As the insignia of his office, a whip was bestowed on him by his sovereign, and he exercised an indistinct sort of primacy among the other union representatives. The king retained his judicial prerogative in all heinous offences, such as murder; and there seems to be some probability that the *bara bandari* (Cachari chief law-man), the *raj pandit* (Hindu spiritual guide to the king), and the *bara mazumdar* (principal union representative) sat as a sort of judicial committee to advise the Raja in capital cases where a Bengali was concerned. The fact that the Hindu civil code depended upon the Sastras, and the Musalman code on the Kuran, of both of which the Cachari Raja was equally ignorant, forced the immigrants to depend on some voluntary organization for settling their internal disputes, and their head-men were thus entrusted with certain fiscal and criminal powers. These criminal powers depended upon the representative status of the league heads, and not upon the title conferred by the Raja. Thus, the chief criminal power was vested not in a *chaudhari*, but in the *mazumdar* of Bikrampur, who became *bara mazumdar*, and as such above all the *chaudharis* in the

State. While the fiscal and criminal administration was thus provided for with the minimum of royal interference, civil disputes were settled without any interference whatever. In case of a difference between the sharers of a *khel*, the matter was referred to the *khel-mukhtar*, who probably took the advice of the elders on the subject; if he could not settle the dispute, the question was referred to the *raj-mukhtar* or union representative. In disputes between *khels*, the court of the first instance was the League Head, who, with the assistance of a council selected from the different *khels* within his *raj*, heard and decided the case. It is not clear whether any legal organization existed for enforcing such decrees; but the fiscal and criminal powers of the *raj-mukhtar* gave him a large and loose authority, and, as a matter of fact, his decree was enforced by the imprisonment of any person who delayed to obey. In difficult or keenly-contested cases, an appeal or reference could be made to the Raja. In such cases the sovereign consulted the *raj pandit* if the parties were Hindus, and that officer repeated the Sastras and laid down the law. In Musalman cases the Raja consulted with whoever was the chief acknowledged exponent, for the time being, of the Kuran. Stories are still current how, when a Hindu case came up, the Raja asked his *pandit* what the sacred texts said. The *pandit* declared them. The Raja answered, 'It is just,' made due obeisance to the *pandit*, gave him a present, and decided the case.

Pemberton, writing in 1835 shortly after the annexation of the district, describes the plains of Cachar as a fertile tract with great possibilities, which suffered from a want of population, and from the disturbances that had occurred at the beginning of the nineteenth century. South of the Barak there were, according to Captain Fisher's estimate,* 1,711 square miles of the finest plain, almost wholly unoccupied, though the sites of numerous villages, which were densely inhabited during the reign of Krishna Chandra, were still discernible along the river banks. North of the river cultivation soon revived on

Pemberton's
description
of Cachar.

* Report on the Eastern Frontier of British India, by Captain Pemberton, page 198.

the establishment of a settled form of government, and a line of villages quickly sprang up on both sides of the Barak from Badarpur to Banskandi.

Revenues of
Kachari
Raja.

According to Pemberton* Krishna Chandra obtained a lakh of rupees as revenue which was realized partly in cash, and partly in kind and labour, and was distributed as follows: The Cachar Plains Rs. 69,000; the North Cachar Hills Rs. 5,000; hills subsequently annexed to Manipur Rs. 1,000; Dharmpur, which seems to have been situated between the Kapili and the Jamuna, Rs. 25,000. It is difficult to imagine that the estimate for Dharmpur can be correct. The accounts given in the Ahom chronicles suggest that this portion of Assam was at all times a very jungly tract, and at the time when Pemberton published his report it is said to have contained not more than five square miles of cultivated land.

Tula Ram
Senapati's
territory.

Before considering the development of the district under British rule, some reference must be made to Tula Ram Senapati. This man was sprung from humble origins, but for many years he occupied as a *quasi* independent chief, a considerable tract of country in the North Cachar Hills and the upper valleys of the Dhansiri and Doiang.

His father, Kacha Din, was a khitmatgar in the employ of Raja Krishna Chandra, who was appointed to an office in the hills. He rebelled, and then was foolish enough to put himself in the power of the Raja's Agents at Dharmpur, by whom he was put to death. His son, who was acting at the time as a chaprasi in the Raja's service, escaped to the hills, and successfully resisted all

* Page 203.

attempts that were made to reduce him to submission. In 1828, he entrusted the command of his levies to his cousin Gobind Ram, who defeated Gobind Chandra's troops, but then turned upon his kinsman, and drove him into Jaintia territory. From here Tula Ram was brought back by Gambhir Singh, the Raja of Manipur, and in 1829 Mr. Scott, the Agent to the Governor-General on the north-east frontier, induced Gobind Chandra to assign to him a definite tract of land within the hills. In 1834, he entered into an agreement with the British Government by which he was confirmed in the tract of country "bounded on the west by the Dyung river, and a line to be determined hereafter, drawn from the Barea ford on the Dyung to a point on the Jamuna river, between the cultivation of Seil Dhurmpore and of Duboka and the Hajae (excluding the two latter); by the Jumuna and Dyung rivers north, by the Dunsira river east, and to the south and south-west by the Naga Hills and Mowhier river"—boundaries which it would be a little difficult to lay off upon the ground. Tula Ram died in 1850, and as his descendants did not seem capable of administering the country it was resumed in 1854.

Captain Butler, who visited the ex-chaprasi in 1845, gives the following account of the surroundings of his village near the Jamuna river :—

Butler's
account of
Tula Ram.

"His dwelling was a wretched grass hut situated on the edge of a tank choked with rank weeds, situated in the middle of an extensive and poorly cultivated grass plain. A few straggling huts, inhabited by Cacharees and dependents of Sena-puttee, formed all that could be called a village; a few pigs, fowls, and ducks were wandering about, but there were no signs of comfort around any of the huts; no gardens or enclosures; all appeared poverty stricken, as well as sickly, in this wilderness

of jungle. Tooluram Senaputtee, an infirm old man, was clothed in the meanest cotton garb, and looked more like a skeleton than a living being.”*

Tula Ram's territory is said to have covered an area of about 2,160 square miles, but to have contained only about about 5,200 persons, who could not have paid a revenue of more than Rs. 1,000.

Develop-
ment
of the Cachar
plains.

Under British rule there has been a great expansion of the population, and the plains, which in Captain Fisher's time were one vast expanse of jungle, have now been peopled almost to the limit of their capacity. Pemberton in 1885 estimated their population at some 50,000;† in 1901 it was nearly 415,000. This great development has been due to natural increase, to the existence of the tea industry, which has brought thousands of coolies from other parts of India, and to immigration from the densely peopled district of Sylhet.

The history of the district since it came under British administration has been one of peaceful progress, and there is little for the historian to record. The mutineers from Chittagong were, however, defeated here in 1857, the Lushais were for many years a source of trouble on the southern frontier, and several Europeans lost their lives under circumstances which aroused considerable excitement at the time.

Destruction
of mutineers
in 1857-58.

At the end of 1857, a party of the Chittagong mutineers succeeded in making their way through Sylhet into the district, with the object of proceeding into Manipur. They were met by a detachment of the

* Travels and Adventures in the Province of Assam, by Major John Butler London. Smith Elder & Co., 1855, page 16.

† Page 199.

Sylhet Light Infantry, which inflicted considerable loss upon them in the several engagements that took place. The mutineers were driven into the jungle where they were hunted down by Kukis, or died of starvation, and it is believed that out of the three companies that left Chittagong not more than three or four individuals escaped death or capture.

In 1882, a curious outbreak occurred which resulted in the death of the district officer. The incident is thus described by Sir W. W. Hunter:—

*Sambhudan's
rising in
1882.*

"A man named Sambhudan, who had set up as a worker of miraculous cures, and as a directly inspired agent of the deity, gathered together a small body of followers, and took up his residence at Maibang, where he lived at free quarters on the forced contributions of his neighbours, and became the terror of the country-side. The Deputy Commissioner proceeded to Maibang with a force of armed police, but on his arrival found the place deserted. Meanwhile Sambhudan with twenty followers had proceeded to Gunjong, the headquarters of the North Cachar Subdivision, about six hours' journey from Maibang, and burnt the place; killing two servants and a policeman. They then returned to Maibang, where Major Boyd and his little force had encamped for the night, and attacked him at daybreak the following morning, the deluded marauders having been persuaded that Sambhudan's magical spells had rendered them invulnerable to bullets. The attack was easily repulsed, and eight or nine Cacharis were killed. Major Boyd, however, received a severe cut in the hand from a dao or hatchet, which being unskilfully treated in the absence of proper medical assistance, resulted in his death from tetanus in a few days. Sambhudan evaded capture for a time, but his hiding-place was afterwards discovered. In attempting to escape from the cordon of police which surrounded him, he received a wound in the leg, from the effects of which he bled to death. A man named Man Singh, who acted as a sort of high priest to Sambhudan, was sentenced to transportation for life."

Bounded as it is both on the north and south by hills inhabited by wild tribes, Cachar has suffered more

*Frontier
troubles.*

than once from the incursions of these savages. In 1835, Pemberton reported that the southern portion of the district had been abandoned in consequence of outrages committed by raiding parties from the Lushai Hills, and that Captain Fisher was establishing Manipuri villages in this locality, as they were accustomed to dealing with those savages.*

**The Lushai
raid of 1849.**

The first raid on record is that of 1849 when the Lushais attacked a Kuki village ten miles south of Cachar, killing 29 persons, and making 42 prisoners. In the following year an expedition was sent under Colonel Lister into the hills, which burnt a village and then retired. The protection of the frontier continued to be a source of much anxiety to the district officers and steps were taken to raise a Kuki company.

**The Lushai
raid of 1869.**

The Lushais continued to raid upon the plains, but Cachar itself escaped from their visitations till 1869, when they burnt the garden of Loharbund and made an attack upon Maniarkhal. An expedition was despatched into the hills, but the difficulties of the country and the inclemency of the weather were such that it returned without accomplishing anything of note. In December 1869, Mr. Edgar, the Deputy Commissioner, made a tour into the Lushai Hills, and it was hoped that he had succeeded in placing our relations with the hillmen on a more satisfactory footing. These expectations were, however, doomed to disappointment, and in less than twelve months after his return, our troublesome neighbours once more made their presence felt.

In January 1871, the Kachari village of Ainakhal in the south of the Hailakandi valley was attacked, and 25 persons were killed and 37 taken prisoner. The Alexandrapur tea garden was destroyed, and, though the proprietor Mr. Sellar succeeded in making his escape, Mr. Winchester, a neighbouring planter who was breakfasting with him, was killed, and his little daughter taken prisoner. A few hours later an attack was made on the neighbouring garden of Katlichara, but the raiders were driven off from the bungalow and the lines, though they succeeded in killing five coolies and wounding others. The attack was renewed on the following day but the Lushais were again beaten off. Three days later Maniarkhal, which is situated on the Sonai near the eastern frontier of the district, was attacked. The defenders were relieved by a party of sepoy and police under the District Superintendent of Police, and on the second day the Lushais were driven off with a loss, it is said, of 57 men. While the attack on Maniarkhal was going on, another party of these savages raided the gardens of Darmiakhal and Nagdigram, killing eleven persons on the latter estate and capturing three prisoners. On the following day the rear guard of a party of troops and police, who had been sent to the relief of Maniarkhal, were attacked near Nagdigram. The men stood their ground with coolness and determination, and gave time to the convoy whom they were escorting to escape. Eventually they were overpowered and six out of eight sepoy killed. The last raid was made towards the end of February, on the Jhalnachara garden. The Lushais were repulsed, but not before

The Lushai
raid of 1871.

they had killed four persons and wounded three. In the following November, a strong military force was sent into the hills. This expedition was completely successful in procuring the submission of the chiefs and satisfaction for the outrages, and twenty years elapsed before another raid was made upon the plains. In 1890, after the great expedition of the previous year, stockades were built at Aijal and Changsil, and a Political Officer was stationed in the Lushai Hills. Captain Browne, the first officer gazetted to this appointment, was, however, killed in September 1890, and the hillmen rose and attacked the two stockades. Mr. McCabe was appointed to succeed Captain Browne, and in 1891 suitable punishment was meted out to the offending chiefs. It was thought that the tribes were gradually settling down under our rule, but in February 1892, they suddenly rose and attacked Mr. McCabe. The Political Officer had no difficulty in holding his own, till the arrival of reinforcements enabled him to act on the offensive; but in April, a party of Lushais, with the evident intention of creating a diversion, raided the garden of Barunchara. They burnt five houses in the lines and killed 42 coolies, some of whom were terribly mutilated, and then withdrew into their jungle-covered hills. The Lushai Hills have now been pacified, and since 1892 there have been no incursions into the district of Cachar. A full account of the Lushais and their raids up to 1882 will be found in the North-East Frontier of Bengal by Mr. (afterwards Sir) Alexander Mackenzie. For the history of the tribe subsequent to that date, reference should be made to the Gazetteer of the Lushai Hills.

The villages of the more savage of the Naga tribes lie considerably to the north-east of Cachar, and only once since our occupation of the district have they ventured to disturb its peace. This was in 1880, when the Khonoma men, who had shortly before killed Mr. Damant, the Political Officer of the Naga Hills district, were being beleaguered by our troops. A party of raiders made their way from Khonoma to Baladhan, a garden more than eighty miles away in the north-east corner of the Cachar Plains, and killed the manager Mr. Blyth, and 16 or 17 of his coolies. The same garden earned an unenviable notoriety in 1893, when the bungalow was broken into, the chaukidar and the manager murdered, a woman who lived in the house mortally wounded, and the contents of the safe removed. Six Manipuris and one Gurkha were finally sent up for trial before the Sessions Judge, who convicted all the prisoners, and sentenced four to death and three to transportation for life. On appeal they were acquitted by the High Court, but His Excellency in Council recorded the opinion that, after perusing the papers submitted, he was unable to say that there were no grounds for the opinion expressed by the Chief Commissioner that the acquitted Manipuris were most probably the persons concerned in this atrocious crime. The case aroused much interest at the time, and a question was asked in Parliament with regard to certain irregularities which were said to have taken place in the course of the police investigation, the magisterial enquiry, and the trial in the sessions court. Further enquiries which were made into the matter tended to exonerate the officers concerned.

Murders at
Baladhan.

**Murder of a
railway
engineer in
1898.**

In 1898, some alarm was caused in the North Cachar Hills by the murder of Mr. Wilde, an executive engineer, who was engaged on the construction of the railway. Mr. Wilde was riding along a narrow part of the road when he met two Pathan contractors with a third man of lower rank mounted on ponies. He called on them to move aside and let him pass, and, when they refused to do so, there was a violent altercation and some jostling. One of the Pathan contractors was hustled off his pony, and the other then drew his knife and attacked the engineer. Mr. Wilde galloped off, but, after he had gone a short distance, his pony stumbled and threw him, and the Pathan, who had followed in pursuit, again attacked him with his knife. The second contractor then came up, and the two men pushed and dragged their victim into the jungle at the side of the road, where they hacked him to death, the wounds inflicted being of a most brutal character. The whole occurrence was witnessed by a Naga who was working near. The murderers and two other Pathans who were concerned in the outrage were subsequently arrested. One of the murderers committed suicide in jail, the other was sentenced to death and hanged.

**Archæo-
logy.**

Cachar contains few archolæological remains of any interest. At Maibang there are ruins which are probably the remains of the palace of the Raja, but the walls have been almost entirely demolished, and it is hardly possible to trace even the outline of the building. There are also some fifteen rock sculptures in an indifferent state of preservation, eleven of which represent foot and one a horse soldier, one a horse, one a tiger, and one a

tortoise. A solid rock, the size of a small cottage, has been carved into the outward seeming of a house. At Khaspur, on the river Madhura, there are four temples and two other masonry buildings, but they are of comparatively recent date and possess little architectural merit. At Chandragiri there is a temple with a *lingum* which is still worshipped by the villagers, while at Badarpur there are the remains of an old fort on a rock overhanging the Barak.

CHAPTER III.

POPULATION.

Area and density—Growth of population—Migration—Sex—Marriage—
Infirmities—Language—Caste—Religion—The Shahaj Bhajan—
Hindu Festivals—Sacred places—Muhammadans—Christianity—
Occupations—Hindu marriage ceremonies.

**Area and
Density.**

THE total area of the district in 1901 was 3,769 square miles* and the density was only 121 to the square mile. Cachar is, however, pre-eminently a place in which a general average of this kind is liable to give rise to most erroneous impressions, and, as a matter of fact, the district is by no means sparsely peopled. The section of the Assam Range which has been formed into the North Cachar subdivision only returned a population of 12 to the square mile, after deducting the persons who at the time of the census were engaged on the construction of the Assam-Bengal Railway. But the hills are not capable of supporting a dense population, and, prior to the completion of the railway, the intervening valleys offered but few attractions to the settler.* In the plains, after deducting the area included in the reserved forests which occupy almost the whole of the south-eastern corner of the district, there was a density of 821 to the square mile. A considerable portion of the Katigara thana, which lies between the Barak and the North

* In consequence of the change of boundaries in 1904, the area of the district was reduced to 3,564 square miles.

Cachar Hills, is too low for permanant cultivation, and the density in this area is only 82 to the square mile. If we deduct this tract in addition to the area occupied by reserved forests, it appears that in the remainder of the plains, which cover an area of 697 square miles, the density in 1901 was as much as 515 to the square mile, a figure which for an almost purely rural population must be considered high.

There seems little doubt that, prior to our occupa- Growth of
population.
tion of the country, the population was extremely sparse. Reference has been already made to Pemberton's estimate of 50,000 souls as the population of the plains. In 1855, a rough census was taken which gave a total of 85,000 inhabitants.† This estimate was apparently too low, and ten years later Mr. Edgar calculated that, including

<i>Cachar Plains.</i>			
	Population.	Percentage Variation.	
1872 ...	205,027		
1881 ...	293,738	+ 43·3	
1891 ...	367,542	+ 25·1	
1901 ...	414,781	+ 12·8	

<i>Cachar Hills.</i>			
	Population.	Percentage Variation.

1881 ...	20,120		
1891 ...	18,941	- 5·8	
1901 ...	40,812‡	+ 115·4	

bers since that date, the total population was about 152,000 souls. The first regular census was taken in 1872, and the abstract in the margin shows the population returned at that and at each successive census, and the percentage of increase in

* The hills if carved out into terraces after the fashion adopted by the Angami Nagas could support a much denser population than 12 to the square mile. The indigenous population is, however, small, and these low hills with their intervening valleys would probably prove very unhealthy to foreign immigrants.

† Dacca Blue Book, page 328.

‡ Includes 20,824 persons engaged on the construction of the railway.

each decade. Separate figures are given for the hills and plains as the conditions prevailing in these two areas are entirely different.

At first sight it looks as though the census of 1872 must have been far from accurate, but though no doubt it was not complete, its errors were less serious than one might be tempted to suppose. Immigration was proceeding vigorously at this period, and in 1881 it was calculated that only 18·6 per cent. of the gross increase that had occurred since the preceding census, was due to natural growth. This was less than the natural increase in the district, as a whole, during the next decade, which was said to be as much as 18·2 per cent. The bulk of the increase between 1891 and 1901 was due to the excess of births over deaths, and the number of people born and censused in the plains increased by 15·5 per cent. A considerable proportion of this increase was no doubt due to the offspring of females born outside the Province, of whom there were more than 42,000 in Cachar in 1891. The general result is eminently satisfactory. A century ago the eastern end of the Surma Valley was very sparsely peopled, but the population has grown with remarkable rapidity, and outside the reserved forests there is little land remaining in the plains available for settlement. The population of the hills is small, and is very nearly stationary, the number of persons enumerated there in 1901, excluding the temporary visitors working on the railway, being only a few hundreds more than the population of twenty years before. The following statement shows the growth by subdivision during the last two decades:—

	Population.	Percentage variation.	
	1901.	1891-1901.	1881-1891.
Silchar	... 301,884	+ 12·7	+ 26·3
Hailakandi	... 112,897	+ 13·0	+ 21·9
North Cachar			
(excluding railway)	20,490	+ 8·0	- 5·8

101,252 persons, or 24 per cent. of the population of **Migration.** the plains in 1901, had been born outside the Province. The great majority of these persons are coolies, and about three-fifths of the total came from the neighbouring Province of Bengal; Manbhum, Hazaribagh, Bankura, and Ranchi being the districts most strongly represented. There were also a large number of immigrants from the United Provinces of Agra and Oudh, half of whom came from Ghazipur and one-fourth from Azamgarh, and over 12,000 from the Central Provinces. Apart from the garden cooly and the Bengali trader, the number of immigrants is not large. There were a few Kabuli traders, a class that earned an unenviable notoriety in the Kalachara dacoity of 1904, a few Nepalese, and a few traders from Rajputana and Ajmer-Merwara. In North Cachar no less than 40 per cent. of the population in 1901 had been born outside the Province, but they were merely temporary visitors engaged on the construction of the railway, and have long since left the district. Cachar, as a whole, gains largely by interdistrict migration. In 1901, it received 28,988 persons and sent out 7,259 emigrants, the net gain being 21,729. The majority of emigrants go to Sylhet and the Naga Hills and are probably cultivators who move their homes across the district boundary. The same presumably holds good of the

immigrants, the great majority of whom come from the neighbouring district of Sylhet (25,971), and the State of Manipur. The number of people born in Sylhet and censused in Cachar only increased by 2,259 during the last decade, but this does not represent the total amount of immigration that has taken place. Assuming that the death-rate amongst Sylhettis settled in Cachar in 1891 has been 40 per mille per annum, it would have required the transfer of 8,500 people merely to keep the figures at the level of that year. For further details on the subject of birthplace reference should be made to Table V.

Sex.

The proportion of women to men in the Cachar Plains has always been low, as will be seen from the following figures showing the number of women to a thousand men at each census since 1872: 1872, 857; 1881, 878; 1891, 891; 1901, 918. This is, however, largely due to the disturbing effect of immigration, and if this factor be eliminated and the proportion calculated on the number of people born in Cachar and censused in the Province, it rises to 1881, 979; 1891, 974; and 1901, 976; a ratio which at the last two enumerations was 14 per mille higher than that prevailing in the plains districts of the Province as a whole. In North Cachar, amongst the indigenous population, the proportion of women very slightly exceeded that of men.

Marriage.

The following statement shows the extent to which infant marriage is prevalent in the Cachar Plains, and for the sake of comparison, figures have been added for Goalpara and Nowgong:—

Percentage of girls married and widowed in 1901.

		Age. 0-10	Age. 10-15
Cachar, Hindu	...	2.3	40.8
Muhammadan	...	0.6	32.9
Goalpara, Hindu	...	4.8	62.3
Nowgong „	...	0.2	10.5

Percentage of girls unmarried.

			Age. 15-20.
Cachar, Hindu	...	...	13.3
Muhammadan	...	...	9.0
Goalpara, Hindu	...	...	7.2
Nowgong „	...	...	40.1

Infant marriage is not so common in Cachar as in Goalpara, but this unnatural and unwholesome practice is far more prevalent than it is amongst the Assamese residing in Nowgong. For every Hindu child-wife or widow in the latter district under 10 years old there are 11 in Cachar and 24 in Goalpara, while for every Hindu girl so circumstanced between 10 and 15 in Nowgong there are four in the former and six in the latter district. The effect of fashion can be seen in the tendency amongst the Muhammadans to marry their girls young; though they have not even the traditional excuse put forward by the Hindus for a practice which must be inconvenient to the bridegroom, and is liable to produce the most deplorable effects upon the bride, and her off-spring. The figures for North Cachar would not repay examination, owing to the enormous number of temporary visitors. Amongst the animistic tribes in the hills, girls are hardly ever married before they attain sexual maturity.

The growth of the population largely depends on the proportion borne by the potential mothers to the total. In

this respect the Cachar plains have an advantage over most of the districts in the Province, as 169 per mille of the total population in 1901 were married women between 15 and 40. The corresponding figure for Assam, as a whole, was 157.

Infirmities.

The Cachar Plains are fairly free from the four special infirmities selected for record at the census, blindness, deaf-mutism, insanity and leprosy. In no case did the proportion of afflicted males exceed the proportion for the Province of Assam, though in every case except that of the blind it was largely in excess of the proportion for

	Blind- ness.	Deaf- mu- tism.	Lep- rosy.	Insan- ity.	the Indian Empire. The abstract in the margin shows out of 10,000 males in 1901 the number afflicted in Cachar, in the Province as a
Cachar Plains ...	8	9	11	5	
Assam ...	10	9	13	5	
Indian Em- pire ...	12	6	5	3	

whole, and in the Indian Empire.

Language.

Bengali is the common language of the plains, and in 1901 was returned by 61 per cent. of the population; Hindi by 21 per cent.; and Manipuri by 11 per cent. In the hills the commonest indigenous forms of speech are Dimasa, which belongs to the Bodo group of languages, Rangkhoh which belongs to the Kuki group, and Naga. Dimasa or Hills Kachari comes from the same stock as Bodo or Plains Kachari, but Dimasa differs more from Bodo than even Garo does. An account of this language will be found in the Linguistic Survey of India, Volume III, Part II, page 56. For an account of Rangkhoh reference should be made to Part III of the same volume of the same work, page 181.

Caste.

The earliest inhabitants of the district seem to have been Kacharis, Manipuris, Muhammadans, and low

caste Hindus from Sylhet. There is in consequence a certain lack of distinction in the Hindu social system of the present day. There are a certain number of Brahmans and Kayasthas, but the bulk of the Hindu population is composed of castes that occupy but a humble position in the Hindu social scale. The one most strongly represented is the Dom Patni, a fishing and boating caste who have largely taken to agriculture. Then come the Manipuris, who, though they style themselves Kshatriyas, are of aboriginal descent, and the Namasudra or Chandal, another fishing and boating caste who also have taken to the plough, but who, like the Dom Patni, come very low down in the Hindu social scale. The Jugis or weavers have settled in strong force in the district, but they have quite abandoned their traditional occupation. From their hands, too, a Brahman is unable to take water, but they are making strenuous efforts to rise in the social scale. The coolie castes most strongly represented are the Bauris, Bhuiyas, Chamars, Mundas, Musahars and Santals. The great trading caste of Sylhet, the Shahas, and the great cultivating caste of that district, the Das, are only represented by a few hundred persons. A description of the origin and subdivisions of the principal Hindu castes found in the district will be found in Mr. Risley's Tribes and Castes of Bengal. The numbers returned under each of the main castes will be found in Table V.

The European population of the district is considerable, and in 1901 amounted to no less than 317 persons, a figure that was only exceeded by Sibsagar and Lakhimpur. Most of these people were living in the *sadr* subdivision.

**The
Kacharis.**

The history of the Kachari tribe has already been set forth at length, and for an account of the manners and customs of the Dimasa, the section of the tribe living in Cachar, the reader cannot do better than refer to Mr. Soppitt's Historical and Descriptive Account of the Kachari Tribes in the North Cachar Hills, which was reprinted, with an introduction by Mr. Baker, in 1901, by the Shillong Secretariat Printing Office.

The Kacharis generally live in the valleys that intersect the hills. The houses in their villages are placed in two lines facing one another, and in the centre there is the young man's club or *nodrang*, which is so common a feature in the villages of the wild tribes of the north-east frontier. The houses are built on the ground, and are divided into three compartments. Men and women alike are fairly tall and muscular. Men wear a waist cloth, shawl, and turban; women wear a petticoat reaching from the waist to the knee, and another cloth to cover the upper portion of the body. The Kacharis in the valleys and the plains portion of the district, grow wet rice; in the hills they follow the shifting system of cultivation known as *jhum*. Two sections of the Kacharis call for special mention. The Barmans are Kacharis who are not only Hindus but have obtained by purchase the right to wear the sacred thread. These Barmans are not a caste or separate section of the tribe, and even the child of a Barman has to pay for his sacred thread, though he is allowed to buy it cheaper than the ordinary Kachari. The Shemsharao are a cross between the Kacharis and the Nagas, whose headquarters are situated in the Shemkor village which overhangs the Langting river. They

are said to be Kacharis who were driven eastward by the Syntengs about the middle of the eighteenth century. They, in their turn, beat back the outlying sections of the Naga tribes and took possession of their women. The language that they speak is pure Kachari, but in physique and face they have a strong touch of the Naga, and they wear Naga and not Kachari clothing.

The Kukis are divided into four tribes: the Rangkhols ^{The Kukis.} with their allied tribe the Betes, and the Jansen with their allied tribe the Thadois.* The Rangkhols and Betes originally lived in the hills now inhabited by the Lushais. Farther south were the villages of the Jansens, who, urged on by one of those strange impulses which have kept the tribes of the north-east frontier in a condition of perpetual unrest, moved northwards into the country of the Rangkhols, and compelled them to fly across the Surma Valley into the hills of North Cachar. Shortly after this exodus the Betes were compelled to follow the Rangkhols, and the Jansens and Thadois were left in occupation of the hills that form the southern boundary of Cachar. The migration of the first band of Kukis, "the old Kukis" as they are sometimes called, is said to have taken place at the end of the eighteenth century.† But the northward movement of the tribes had not yet spent itself, and in course of time the Jansens and the Thadois were themselves driven out of the southern hills, and were compelled

* For a fuller account of the Kukis the reader should refer (a) to a Short Account of the Kuki Lushai Tribes, by Mr. Soppitt, Shillong Secretariat Press, 1887, which is the authority for the description of the tribe which is given in the Gazetteer; and (b) to a Monograph on the Kukis which is at present under preparation.

† Mackenzie's North East-Frontier of Bengal, page 146.

to follow the Rangkhols to their retreat in North Cachar. This second migration of the "new Kukis" took place in 1851-52. Though loosely referred to under the one generic term of Kuki, there is a marked difference between the Rangkhols and the Jansens. The former are a democratic community, and the affairs of the village are managed by a group of village officers, the *galim* or headman, the *gabur* his assistant, and two subordinates, the *chapia galim*, and the *chapia gabur*. These offices are not hereditary, and a candidate for public service has to begin at the bottom of the ladder as a *chapia gabur*. The Jansens on the other hand are ruled by Rajas, whose authority before they moved into British territory was unquestioned. The Raja was supported by a contribution levied from each house and was aided in the administration of the village by a *mantri*. The Kukis generally build their villages on the tops of hills, the houses being placed on either side of a long street. The houses are built on platforms with a veranda in front, and are partitioned off into separate cubicles. The people are short and have sturdy well-developed limbs. They have high cheek bones and flat noses, and the men have often a very effeminate appearance. The Rangkhols work for their wives and are generally required to render three years' service to their father-in-law before marriage, and two after. This excuses them from the bride price which the Jansens generally have to pay, but they in their turn are exempt from any term of service. Like most of the other hillmen they are *jhum* cultivators, and unless they have been to some extent affected by the ideas of their Hindu neighbours,

there are few articles of food which come amiss to them.

Most of the Nagas in Cachar live in the northern ^{Nagas.} subdivisions of the district and belong to the Kaccha Naga tribe. Unlike the Kukis and Kacharis they are not a migratory people, and though they shift their *jhums* every second or third year, they seldom change their village sites. Their houses are built of planks and thatch, the side walls disappearing in the roof, which is brought down from either side of the roof tree almost to the ground. The people are very liberal in their views on the subject of what does or does not constitute human food; and there are few things which to a Naga come amiss, from a rat to an elephant which has been dead some weeks, or from a snake or a puppy to a smoking slice of pork. Like most of the other hill-men they are very partial to rice beer, which they consume in enormous quantities. Child-marriage is unknown, and as long as they remain unwed, girls are allowed the greatest latitude. Once the knot is tied they abandon the amusements of their youth, and girls, who were most prodigal with their favours in their salad days, are seldom unfaithful to their marriage vows. An account of the Naga tribe of North Cachar was published by Mr. Soppitt in 1885 (Shillong Secretariat Press.)

Classified by religion, the population of the Cachar ^{Religion.} Plains was distributed at the last census in the following proportions: Hindus 67 per cent., Muhammadans 81 per cent., Animists 2 per cent. The indigenous populations of the Cachar Hills was about equally divided between Animism and Hinduism as nearly all the Kacharis

returned themselves under the latter head. Of the Hindus who returned their sect, 49 per cent. described themselves as Saktists, 9 per cent. as Sivaites, while 42 per cent. professed the milder tenets of Vaishnavism.

**The Shahaj
Bhajan.**

A somewhat curious sect is that which is known as the Shahaj or Kishori Bhajan. It was founded by one Kalachand Vidyalandker of the Bikrampur pargana in Dacca, and salvation is said to be obtained by imitating the amorous actions of Krishna at Brindaban. Each devotee has one or more female associates with whom, according to most accounts, he indulges or endeavours to indulge in very curious practices. The members of this sect are said to assemble secretly at night and to worship the mistress of their priest, who is supposed to represent Radha, the wife of Krishna. Food is offered to her, and after she has taken a little, the *prasada*, or leavings, are distributed amongst the congregation. Songs are sung, ganja is consumed, and a good deal of sexual intercourse is supposed to take place. The female worshippers are generally young widows, and most of the members of this sect are persons of low caste.

**Hindu
festivals.**

The following are the principal festivals of the Hindus :—

The Saraswati puja is held in January or February. A clay image of the goddess of learning is procured and offerings of flower, leaves, and eatables are made to it, and the worshippers abstain from book and pen. This puja is usually confined to the higher classes of society. The Surya puja is held in the month of Magh (middle of January to the middle of February) in honour of the sun god. A plantain tree is set up in the

courtyard and decorated with flowers, and offerings of leaves, eatables, and flowers are made, the women singing all the while in honour of the sun god. In February or March comes the Sivarati, during which the worshippers fast during the day and sit up at night to worship Siva's lingam and eat bhang and ganja. About a fortnight later there is the Doljatra. On this occasion the image of Vishnu is worshipped, and the people pelt one another with red powder in memory of the amorous contests of Krishna with the milkmaids of Brindaban. Towards the end of March there comes the Baruni snan, when ablutions are offered to the spirits of departed ancestors, and the villagers feast on curds, parched grain, and molasses. The Rathjatra takes place in June or July when an image of Vishnu or Jagannath is dragged about on a car. On the last day of Sraban (middle of August) there is the Bishahari or Manasa puja in honour of the goddess of snakes. This puja is very popular in Cachar and is observed by all Hindus, high and low, rich and poor alike. Flowers, leaves, and eatables are offered to a clay image of the goddess, and goats, ducks, and pigeons are sacrificed. A few days later, the Vaishnavite section of the community, and more specially the ascetic Vaishnavas or Bairagis, as they are called, celebrate the Jhulan festival. Images of Krishna and Radhika are worshipped and swung to and fro, and songs are sung at night. In the same month or in the month following there is the Janmastami in honour of the birth of Krishna. The main feature of this festival, which is observed by every devout Hindu, is abstinence from food and drink. In September or

October there is the Durga puja. This is a time for general merry-making. New clothes are given to the children, members of the family who are away return home, and there is general feasting and jollification. The rich purchase clay images of Durga, Lakshmi, Saraswati, Kartik, and Ganesh. Poorer people make their offerings to plantain trees or earthen jars filled with water and mango leaves. The puja lasts for four days. Goats are usually sacrificed on each of the first three days, and on the third day those who can afford to do so kill a buffalo. On the last day the goddess is worshipped with flowers, leaves and eatables, and then thrown into water amidst singing and beating of cymbals.

Four days after the Durga puja comes the Lakshmi puja, and in the last quarter of the year there are the Kali, Kartik, and Jagadhatri pujas, and the Rashjatra. The last-named festival is only observed by the Vaishnavites and is especially popular with the Manipuris.

A special form of religious ceremony is known as the *noaka* or boat puja and is performed by a wealthy man in satisfaction of a vow, who generally spends from Rs. 300 to Rs. 500 on the ceremony. A shed is built, at the end of which is a boat painted and gilt, from which rise, tier upon tier, the images of various gods, amongst whom Bishahari is generally the most prominent. For several days sacrifices are offered to the deities, and Brahmans, who are well paid and feasted for their services, offer up their prayers. At the end of this time the house and its contents are abandoned and allowed to fall to pieces. Every Hindu has a *guru* or religious teacher,

to whom he makes an annual offering varying from two annas to five rupees according to his means.

The Pous or Uttarayan Sankranti held about the middle of January has no religious associations and corresponds to the Magh bihu of the Assam Valley. The villagers light bonfires in the rice fields, at which they warm themselves after the morning bath, and devote the day to merry-making.

Cachar, as is not unnatural, cannot boast of many ^{Sacred Places.} places which are sacred in the eyes of the Hindus. Lying as it does at the extreme end of the Surma Valley, and peopled, as it must originally have been, by unconverted tribes, there is nothing in its history to connect it with the mythology of Hinduism. In the *sadr* tahsil there are two hills, Tilain and Shamatila, which are sacred to Kali, and one, Sivtila, which is appropriated to the great god Siva, but none of these places are held in much esteem. About 29 miles south-east of Silchar, there is a peak in the Bhuban range, known as Bhuban tila, which is visited by devout Hindus. There are images of Siva and Parbati at this spot, and pilgrims make offerings to these idols, bathe in a pool, and drink from a sacred well in the vicinity. They then enter a cave in the side of the hill which is supposed to possess a certain degree of sanctity. The Siva ratri and the Baruni are the principal occasions on which this hill is visited by the devout. There is also an idol of Siva on the Laklaki tila in the Chatla Haor pargana, to which people have made pilgrimages of recent years. In the Saraspur hills, to the west of the district, there is a place in village Thandupur which is said to have been consecrated by the presence of Kapil

Muni, who lived there in the time of Pura Raja, the father of Gaur Gobind the king of Sylhet who was overthrown by the Muhammadans in 1884 A.D. The principal festivals observed at this place are the Choet Baruni and the Siva ratri. A considerable fair is held at Katigara on the occasion of the Baruni. There is a Kalibari in the Silchar town which was founded by a peshkar of the Deputy Commissioner's office in 1838, and another in village Tarapur in the Barakpur pargana, which was founded in 1871. At Hailakandi also there is a Kalibari of some note.

**Muhamma-
dans.**

The great bulk of the Muhammadans have moved into the district from Sylhet, and almost all of them are members of the Sunni sect. It is said that the ordinary villager is fairly well acquainted with the principles of his faith, and that it has not been infected with Hindu superstitions to any marked degree, though in the remoter tracts Muhammadans sometimes subscribe to funds started by Brahmans during a smallpox epidemic to promote the worship of the goddess Sitala. There are no mosques of any special sanctity, and prayers are usually said in a thatched hut. The number of people converted to the creed of Islam on religious grounds is said to be extremely small, but men or women, who have become entangled in an intrigue with a Musalman, sometimes change their faith on that account.

**Minor
Religions.**

**Brahmos 49
Jains ... 22
Buddhists 23
Sikhs ... 165**

The statement in the margin gives details for the other religions that had a comparatively small number of adherents in Cachar, in 1901. Nearly all the Sikhs were found in North Cachar, where they were employed in the service of the Assam-Bengal Railway Company.

There were only 1,040 Christians in Cachar, in 1901, 688 of whom were natives. A branch of the Welsh Presbyterian Mission was established at Silchar about 50 years ago, but in the early seventies the work was given up and was not resumed till 1887. In 1908, there were four missionaries there, three of whom were ladies. The Cachar Plains appear to be a somewhat barren field for missionary enterprise, as the number of native Christians only increased by 178 in the twenty years preceding the last census. Christianity has made practically no progress in the hills. Chris-
tianity.

Cachar, like the rest of Assam, is a rural area, and in 1901, nearly 89 per cent. of the population of the plains returned agriculture as their means of support. Tea, the only industry of importance in the district, is only a form of agriculture, and other occupations, such as those of the fisherman or potter, are often combined with husbandry. In 1901, the occupations of the people were classified under 520 different heads, and details for the great majority of these heads will be found in Table XV, Part II, of the Census Report. It is, however, doubtful whether these figures would repay examination. A census does not supply data which are suitable for minute classification or admit of profitable examination in detail, and this fact has been recognized, not only in India, but in most of the countries of Europe. The difficulty which is there experienced is greatly increased in a Province like Assam, where little progress has been made in the specialization of function. The proportion of workers to the total population (48 per cent.) is fairly high. This is largely due to the predominance of the tea industry, which finds Occupation.

work for men, women, and children alike, as the women-folk of the ordinary cultivator do not work in the fields to the extent which is common in the Assam Valley.

Hindu
marriage
ceremonies.

Most of the Hindus in the plains are married by the *jagya* rite, a ceremony which corresponds to the *hompura* of Assam. The first thing to be done after a match has been agreed upon is to fix the date of the ceremony. The bridegroom's representatives proceed to the house of the bride with fish, sweetmeats, curds and betel-nuts, and, on their arrival, the Brahmans of the village are summoned and asked to discover an auspicious day. The next stage is known as Panakhili, and consists of the offering of betelnuts and leaves, with two small pieces of gold and silver, to the family idol, or to the idol of a neighbour, if neither of the families possesses an idol of its own. Two nights before the wedding day the bridegroom and the bride are solemnly bathed, and on the following morning the general merry-making begins. A party of drummers is called in, who, with short intervals of rest, keep up their unmelodious music day and night, the children of the two families are decked out in their best, the bride and the groom are solemnly bathed, and friends and relatives assemble from all sides. At night a theatrical performance is given in the bridegroom's house, if his means allow of it, and a party is despatched to fetch the bride, for in the Surma Valley the actual ceremony generally takes place in the house of the groom. On this night also the contracting parties are once more solemnly bathed. Early the next morning a priest sprinkles water over them from a mango leaf, and places a daub of an oleaginous black ointment, called

adibash, on their foreheads. During the day the bridegroom and some male relatives on behalf of the bride offer oblations to the spirits of their ancestors, and a feast is given to the Brahmans and the assembled guests. In the evening the contracting parties are again solemnly bathed, and attired in their best clothes, and pending the advent of the bride, who arrives in the middle of the night attended by most unmusical musicians, the groom is allowed to witness the theatrical performance that is going on.

When the time for the actual ceremony arrives he is anointed with sandal wood, a crown of pith and flowers is placed on his head, and he is escorted to the front of the main house where a maid or married woman presents him with a ring, a pair of cloths, and some curds. Both parties then enter a small enclosure in the courtyard which has been fenced in with split bamboos and plantain trees, the groom is seated on a stool, and the bride marches round him seven times, throwing flowers and a red powder over him as she completes each circuit. The next stage is called *sampradan*, and is really the binding part of the ceremony, when the girl and her dowry are formally handed over to her husband. A fire is then lighted, flowers, rice, and *ghi* are thrown into it, and the priest utters the appropriate *mantras*. The young pair, who by this time must be thoroughly worn out, are then allowed to retire to rest for the remainder of the night. On the following day they are again solemnly bathed, and are conducted round four bamboos in the courtyard, and a feast is given to the assembled guests. This ceremony is repeated on the fourth day, as on the

intervening day the young couple are not allowed to see one another, and the marriage is then said to be complete.

Lesser
marriage
rites.

Where widow marriage or the marriage of a divorced woman is permitted, the services of a priest are not required, and the ceremony consists of little more than a feast to the friends and the relations. A wedding by the *jagya* rite costs from Rs. 50 to Rs. 300, the bulk of this expenditure being incurred on the provision of food, clothing, ornaments, and fireworks, and the payment of Brahmans and musicians. A widow marriage costs from Rs. 10 to Rs. 70. The lower caste Hindus, who form the great mass of the Hindu population, and the Muhammadans, usually pay money for their brides, the price ranging from Rs. 10 to Rs. 200. The latter is probably a fancy figure, and Rs. 40 or Rs. 50 is generally enough to satisfy the demands of the bride's parents. The bridegroom usually takes his wife to his own home, but occasionally takes up his abode in the house of his father-in-law.

Amuse-
ments.

The ordinary amusements of the people are chess, dice, and cards, and the women of the lower castes take part in dances known as *gopini kirton*. Singing and a rude form of music are a constant source of pleasure, and in places there are simple theatrical performances. In their own home the Manipuris are devoted to the national game of hockey on horseback, which is simply polo on small ponies, played with seven aside, with no goal posts, and with a disregard of the rules which are necessary in the interests of safety where bigger ponies are employed. In Cachar they seldom have an opportunity of playing polo, and have to content themselves with hockey on foot.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Crops grown—Rice—Mustard—Fibres—Agricultural implements—Sugarcane—Cultivation in the hills—Causes affecting productiveness of land—Garden crops—Yield and value of crops—Live stock—Grazing—Cattle disease—Tea—Development of industry—Labour supply—Varieties of plant—System of cultivation—System of manufacture—Outturn and prices—Green tea—Forests—The reserves—Timber trees—System of management—Timber trade—List of reserved forests.

THE staple crops of the Cachar Plains are rice, which **Staple crops.** in 1908-04 covered 66 per cent. of the total cropped area; tea 19 per cent.; oil seeds 5 per cent.; other food grains including pulse 1 per cent.; and sugarcane 2 per cent. Wheat, barely, gram, and maize are only cultivated in small patches, generally by foreigners. The manner in which the staple crops are raised is described in the following paragraphs.

Rice falls into three main subdivisions, *sail* or **Rice.** transplanted winter paddy, *aman* or long-stemmed paddy generally sown in marshy tracts, and *aus* or summer rice. *Sail* usually forms about 70 per cent. of the rice crop of the plains, *aman* about 8 per cent., and *aus* about 22 per cent.

Sail.

Sail, or transplanted winter rice, is raised in the following way. The seeds, which are selected from the largest ears of the previous year's crop, are steeped in water in bamboo baskets, with a layer of straw spread over them, till they begin to germinate. They are then sown broadcast on little beds near the homestead, or on the higher parts of the rice fields. These nursery beds, which are known as *hali charras*, are ploughed up five or six times, and watered till the soil is reduced nearly to a puddle. They are then divided up into small patches with little drains which serve to tarry off the water if there is heavy rain.

The seed comes up a rich emerald green, and at the beginning of summer, these patches of the brightest green herbage are a striking feature in the rural landscape. In the meanwhile the fields are being got ready for the reception of the seedlings. The husbandman starts ploughing as soon as the soil is softened by the spring rain, and repeats the process from four to eight times till he has reduced the land to a rich puddle of mud. After the third ploughing the field is harrowed, the little embankments, a few inches high, intended to retain the water are repaired, and if the fields adjoin the road or the village site, they are fenced in with split bamboo. When the seedlings are about seven or eight weeks' old, they are taken from the nursery bed and carried in large bundles to the field. Here they are planted out in handfuls (*guchis*) each of which contains two or three plants at the beginning of the season, and four or five if transplantation is being carried on at the end of summer, when there is little probability

of the seedlings throwing out new roots. The distance at which the *guchis* are planted from one another depends upon the fertility of the soil and the time at which the work is done, but, as a rule, they are placed about eighteen inches apart. It is not unfrequently the practice to steep the young plants in water before they are planted out, and if they seem too luxuriant, the tops are cut off before they are removed from the nursery. Transplanting goes on from the beginning of July to the middle of September, and is sometimes carried out by the women of the humble Hindu castes such as the Dom Patnis Malis, and Numasudras. Muhammadans never allow their womenkind to labour in the fields, and pay the Hindu women from two to two and a half rupees for every acre planted out. The Dom Patnis and Naths or Jugis have recently come to the conclusion that it is derogatory to employ their women in this way, and no longer allow them to transplant the paddy. Such an innovation is not to be regretted as the work is of a most arduous description, and involves stooping for hours in a field of liquid mud, under the rays of a burning tropical sun. Sometimes the supply of seedlings runs short, and the grain is then steeped in water till it germinates, and sown broadcast on the field. Before the end of the rains the crop is fully grown though the ears are still empty, but about the beginning of October they begin to fill, and the field turns to a rich yellow. From the middle of November to the middle of January, harvesting is going on. Except amongst the Manipuris, the reaping and carrying of the paddy is entirely done by men. A handful of stalks is seized and cut off about eighteen inches below

the ear. Each of these handfuls is called *kachi*, taking its name from the sickle used by the reapers, and twenty or thirty are piled together and then tied up to form a *muit* or bundle. Two *muits* form the load which is carried across the shoulder by the men, on a sharp pointed bamboo or pole cut from an areca tree called *hooja*. The enterprising raiyat in Cachar is, however, gradually realising that there are easier and cheaper means of transporting burdens than men's shoulders, and the harvest is sometimes dragged home on a primitive wheel-less sledge made of bamboo, to which a bullock or a buffalo is harnessed.

Aman

Aman is a long stemmed variety of paddy, which generally yields a smaller outturn than *sail*, while the grain is not, as a rule, of such a fine variety. *Asra*, which is a kind of *aman*, is sown broadcast on low land which has been ploughed up five or six times, and is harvested at the same time as *sail*. The area under transplanted *aman* is not large, and the system of cultivation is practically the same as that employed for *sail*. *Aman* is generally grown in the lower country such as the parganas near the foot of the North Cachar Hills, Banraj, the Chatla haor, and, most of all, the Hailakandi pargana.

Aus is either sown on *chur* land which is exposed to risk of flood, or upon fields from which a crop of *sail* is subsequently taken; it is also sometimes grown in conjunction with a crop of *aman*. In *chur* land the fields are ploughed three times and harrowed, and a short interval is then allowed to give time for the weeds to rot. Another ploughing follows, the seed is sown broadcast, and the ground is again ploughed and harrowed to ensure that the grain becomes thoroughly mixed with the soil. The

crop is generally ready for the sickle in June or July. *Aus* is occasionally transplanted like *sail*, but ripens earlier than that form of rice. *Aus* is grown very largely in the Hailakandi subdivision, where there is nearly one acre of *aus* for every two of *sail*, whereas in the *sadr* thana the proportion is about one to six. The two varieties of *aus* most generally grown are known as *murali* and *dumahi*. The latter, as its name suggests, is supposed to ripen in two months, though it usually takes a little longer, while for *murali* at least three months are generally required.

There are three different systems for raising mus- Mustard.
tard in the district, known by the following names: (1) *dhupi*, (2) *hainna*, (3) *haoria*. *Dhupi* is generally sown on high land near the homesteads. The land is ploughed five or six times, and then manured with cowdung. Three or four ploughings follow, and the mustard seed is sown. The field is then again ploughed twice or thrice and carefully harrowed, to ensure that the seed is mixed with the soil. *Hainna* mustard is sown on *chur* land, the system followed being the same as in the case of *dhupi*, but manure is not required. The *haoria* mustard, as its name implies, is raised in *haors*. It is sown on the moist silt as soon as the water sinks, and no ploughing is required. The land is fertilized by the ashes of the reeds growing in these marshes, which have to be cut and burned before the seed is sown. Mustard is ready to be pulled in February. The plants after they have been taken from the soil are generally left to dry for a few days. They are then tied up in bundles and carried to the homestead where the seed is threshed out with bamboo sticks. Most of the mustard in the

district is grown in the Hailakandi valley, and in the parganas on either side of the Barak, such as Sonapur, Banraj, Rupairbali, and Barakpur.

Fibres.

Jute is grown in small patches as a garden crop. The plants are cut in August and September, stripped of their leaves, tied in bundles, and left to rot in pools of water for from seven to twelve days. When they are ready they are taken from the water, and the outer fabric is neatly removed from the stem. There were only 86 acres under jute in the Cachar Plains in 1908-04.

Small patches of rhea (*bœhmeria nivea*) are grown in the gardens of the fishing castes where they are heavily manured. When the plants are ripe a handful of stems is taken up, broken in the middle, and beaten to and fro in the water till the inner part drops out and only the fibre remains. The thread obtained is exceptionally strong and durable, but the difficulty of decortication has hitherto prevented the growth of rhea on a commercial scale.

**Storage and
Threshing of
Grain.**

Very little sun generally falls upon the actual homestead of the villager as it is buried in clumps of trees, and the grain is accordingly dried and threshed in an open space outside the *bari* called the *chotal*. The place selected is cleared of grass and jungle, plastered with cowdung, and surrounded with a small embankment. The grain is generally trodden out by bullocks, and winnowed either by letting it fall to the ground from a sieve or *kula*, or by fanning it as it is spread out over the ground. When dry it is stored in a small granary or *bhoral*.

The agricultural implements in use are of a very simple character. The plough is generally made of the jack fruit tree or some other hard wood and consists of three parts: (1) the handle and the body, which are usually all in one piece, (2) the pole, which joins the plough at the junction of the handle and the body, and (3) the yoke which is merely a piece of bamboo fastened by rope at right angles to the pole, with pegs affixed to it to keep it from sliding from the necks of the bullocks. The front portion of the body is sharpened to a point which is shod with iron. The whole instrument is suited to the wretched class of animals required to draw it. It weighs, as a rule, about 20 lbs., and when cattle are used, the yoke seldom stands as much as three feet from the ground. When buffaloes are employed the whole plough is constructed on a larger scale. It is obvious that such an instrument can only penetrate from three to four inches into the soil, but the wretched quality of the plough cattle prohibits the use of a more effective implement.

Agricultural
implements.
The plough.

The harrow (*moi*) is a bamboo ladder about eight feet in length, on which a man stands as it is drawn across the field by cattle. It is used to crush the clods turned up by the plough, before mustard or summer rice is sown, and to reduce the fields required for wet rice to puddle. Hoes (*kodals*) are used to trim the embankments (*ails*) which help to retain the water. The head is bought in the bazars and costs from Re. 1 to Re. 1-4, and is fitted with a shaft by the farmer himself. Sickles (*kachi*), with which the rice is reaped, have also to be purchased and cost from 2 to 4 annas.

Other imple-
ments.

The ordinary instrument used for husking grain is the *dheki*, a long beam of wood with a pestle affixed at the end, which is supported by two posts about two-thirds of the length from the head. The shorter end is depressed by the foot and the pestle is thus raised into the air. The weight is then removed and the pestle falls into a small wooden mortar which is sunk in the ground. A large pestle *sia*, and mortar *gail* are also sometimes used for husking grain.

Sugarcane.

Sugarcane is grown on high land near the village site where the soil has to be well manured with cowdung, on low hills or *tilas*, and along the banks of rivers. The crop is propagated from the tops of the best canes, which are cut off at harvest time and kept in a shady place. One of these tops yields on the average about five canes, and as they contain but little juice, the cultivator does not sacrifice much of the gross products of his fields in the cause of reproduction. Three varieties of sugarcane are recognised in Cachar, *viz.*—Dhola Khagri, Lal Khagri, and Bombay.

The Bombay variety is larger and more juicy than the indigenous kinds, but yields a smaller proportion of sugar. The land on which the cane is to be grown is hoed until it is reduced to a fine tilth, and the tops planted in trenches between April and June. The patch is fenced with split bamboo, and while the crop is growing, it is hoed and weeded several times. Constant watching is required to scare away jackals and other animals, and an empty oil tin with a clapper is generally to be seen suspended over each field.

The total area under sugarcane in the plains in

1908-04 was 5,200 acres. The parganas in which it is most extensively cultivated are Vernerpur, Udharband, Chatla Haor, Lakhipur, Sonapur, and Banraj. In the disforested tracts, in the south of the Hailakandi subdivision, no cultivation is required. The low hills are cleared of jungle, the earth turned up with a hoe, and the tops inserted. Canes so planted will yield a crop for three years in succession, as after the stems have been cut the roots are burnt, and throw out new shoots themselves the following season. The pressing of the cane and the boiling of the juice goes on from December to March. The native mill is made of wood, and consists of two rollers fixed side by side in a trough hollowed out of a heavy block of wood. The tops of the two rollers pass through a beam supported by uprights let through the lower block of wood into the ground, and are cut into the form of screws which fit into one another. To the larger of the two is affixed a pole which is driven round and thus causes the two rollers to revolve. This form of mill is called *kamrangi*, but it has been largely superseded by the iron mill. The juice is stored in empty oil tins, and, when a sufficient quantity has been collected, is boiled in iron cauldrons. When the liquid has been reduced to the proper consistency, the cauldron is taken from the fire, and the molasses stirred till they assume the consistency and hue of yellow mud.

In the valley bottoms the Kacharis sometimes grow ^{Cultivation in the hills.} wet rice, in the manner which has already been described. On the hill sides the people follow the shifting system of cultivation known as *jhum*. The jungle is cut in February and March, and fired as soon as it is dry.

The ground is then hoed lightly over, and the rice, which is of two varieties, red and white, sown. While the crop is growing, it has to be kept free from weeds, and it is finally harvested in November. Other crops raised are cotton, chillies, and maize. Cotton is planted, if possible, in sandy soil, in May or June, and is gathered about the the beginning of November. The ordinary agricultural implements in the hills are *daos* or bill-hooks, small axes, hoes, in which the head is fitted at an acute angle to the shaft, and sickles.

Causes affecting productiveness of land.

The fertility of the rice fields mainly depends upon the following five causes:—the water-supply, the quality of the soil, and the liability to injury from flood, wild animals, or shade. The first-named factor is probably of most importance. The animals which do most injury to the crops are pigs, monkeys, and birds.

Serious damage is sometimes done by insects called *lehari* and *kharta*. The *kharta* is a small bug which injures the rice plant by feeding on the stems and sucking all the sap from the young grains. It is most prevalent in July and August and is particularly in evidence during a spell of hot dry weather. High wind and rain drive it back into the jungle, and good results are obtained by lighting fires of vegetable refuse to windward. The best remedy of all is to collect the insects by smearing a winnowing fan with some glutinous substance and brushing it over the ears of grain, when many of the bugs will be found adhering to the fan. This remedy should be tried in the morning or late afternoon, as the insects do not feed in the heat of the day. The *chara* is a tiny beetle, which eats away the outer surface of the

leaves and stalks, and thus affects the outturn of the crops. It attacks the young plants in the nursery and can most easily be destroyed there by spraying.* Smoking the fields also produces good results, but must be continued for some days or the beetles will return. Rain is wanted when *sail* rice is sown and is transplanted, but is not needed for the sowing of *dumahi* and *murali*. During every stage of its growth the plant is benefited by moderate showers, but rain is absolutely essential at the time when the ears are first appearing. Hail storms in December sometimes lay the crop and add materially to the cost of reaping, but fortunately are very local in their action.

One of the most valuable of garden crops is the plantain (*musa sapientum*). As many as ten main varieties of this tree are recognized, but the most important are those known as *athia*, *sail*, *cheni champa*, and *sapri*. The first two groups are again subdivided into a considerable number of different species. The *sail* is a somewhat smaller tree than the *athia*, the pulp of the fruit is white and slightly acid in taste, and it is largely used in combination with soft rice and milk at village feasts. The *sapri* and *cheni champa* are small trees, whose fruit is much appreciated by Europeans. The *athia* plantain is generally grown near the homestead where it can obtain a plentiful supply of manure, but the finer varieties are planted at a little distance to protect them from the earthworms, whose attacks they are hardly strong

Garden
crops. The
plantain.

* The best solution is 1lb Paris Green, 1lb freshly slacked lime or flour, and 150 gallons water. The solution should be kept constantly stirred and should be sprayed on with a fine sprayer.

enough to resist. Sandy soil and heavy clay check the growth of the plant, and anything in the shape of water-logging is most injurious. The trees are planted in holes about a foot wide and eighteen inches deep and are manured with ashes and sweepings. Young saplings take from eighteen months to two years to flower, and the flowers take from three to six months to turn into fruit. The plantain tree plays many parts in addition to that of fruit purveyor. The flower is much esteemed as a vegetable, the leaves serve as plates, and the trunks are used for decorative purposes on occasions of ceremony, and as food for elephants.

Other garden crops.

The betel nut (*areca catechu*) is grown almost as universally as the plantain, and, with the bamboo, forms the great trinity of trees in which the houses of the villagers are usually embedded. The plantation is hoed up and kept clear of weeds, and the trees are most liberally manured with cowdung. Tobacco is generally grown by Manipuris. The seedlings are raised in carefully manured beds in August and September. At the beginning of November they are transplanted into ground which has been reduced to a fine tilth, watered for a few days, and protected from the sun by little sections of the plantain trunk. The bed is lightly hoed up two or three times, and not more than ten or twelve leaves are allowed to grow on each plant, the remainder being picked off as they appear. The leaves are gathered in February and March. If required for chewing they are either dried under a shed, or else pressed into a hollow bamboo (*chunga*) and allowed to ferment. When th

tobacco is destined for the pipe, the leaves are piled in heaps till they ferment, cut up and mixed with molasses, and then are ready for the hookah. The commonest forms of vegetable grown are, spinach, *pui* (*basella alba*), *lai*, a species of *brassica*, different kinds of arums (*kachu*), different kinds of yams (*dioscorea*) and gourds, the country bean *uri* (*dolichos lablab*), the radish *mula* (*raphanus sativus*), the sorrel *chuka sag* (*rumex vesicarius*) and the brinjal or *begun* (*solanum melongena*).

The outturn of different crops varies according to the character of the season, and also to a great extent according to the character and level of the soil on which they are grown. The statement in the margin shows the normal yield per acre laid down by the Agricultural Department after a long series of experiments. These figures only represent a general mean, and even in a normal year there are many fields whose outturn varies largely from the average. The yield of rice, it may be premised, is expressed in terms of husked grain. Like the outturn the cash value of the crop can only be approximately ascertained. The prices obtained by the raiyats vary to some extent in different parts of the district, but probably average about Re. 1-4 per maund of unhusked grain. Assuming that unhusked paddy yields 62 per cent. of clean rice, it would appear that the value of the harvest from an acre of *sail* is Rs. 24, from one of *aman* Rs. 21, and from one of *aus* Rs. 20. For mustard the villagers generally get about Rs. 2-14 a maund, so that the yield from one acre is worth about Rs. 17. Molasses fetch about Rs. 5 per maund, so that the yield from one acre is worth some Rs. 185.

Yield and
value of
crops.

	lbs.
Sail	1,000
Aus	800
Aman	850
Mustard	500
Molasses	2,200

Live stock.

Buffaloes are often used to drag the plough in Cachar, and are of two distinct breeds. The Manipuri buffalo is a fine upstanding animal, with wide spreading horns, and is larger and stronger than the *bangar* whose horns curve downwards and inwards. A Manipuri bull costs from Rs. 30 to Rs. 80, whereas the price of the *bangar* ranges from Rs. 20 to Rs. 50. The price of a Manipuri cow buffalo ranges from Rs. 40 to Rs. 125, and of one of the other breed from Rs. 25 to Rs. 70.

The cattle are miserable little creatures, and are some of the sorriest specimens of their kind. No attention is paid to breeding; during a portion of the year they generally go short of food, and the policy of total indifference and neglect is attended by the usual results. The Manipuri cattle, though small, are a fine and sturdy little breed, and are much appreciated by the cultivators of the Surma Valley. The goats are not much more satisfactory than the cattle, and yield little milk. There is no indigenous breed of sheep, and those that are imported do not thrive. The country ponies too are wretched little beasts about 11 hands high, with neither pace, endurance, nor manners. The Manipuri pony, though small, is a very different little creature. It has astonishing endurance and considerable pace, and Manipuri ponies, with ten stone up, have run the mile in two minutes and ten seconds.* Unfortunately, good ponies are now extremely scarce even in their native valley, and comparatively few of them find their way into Cachar. A census of the live stock was taken in 1902 and disclosed the following results: Bulls and bullocks,

* Dacca Blue Book, page 371.

85,000; cows, 62,000; male buffaloes, 19,000; cow buffaloes, 28,000; young stock, 88,000; sheep, 2,000; goats, 49,000; ponies, 1,100.

During the rains, when the rice crop is on the ground Grazing. and the *haors* or swamps are under water, there is often difficulty in obtaining grazing for the cattle. They are turned out on the high land between the fields, and on the jungle-covered hills to pick up what they can, and rice straw is sometimes fed to them; but in every part of the plains there is a dearth of suitable fodder at this season of the year, and the condition of the cattle falls off very much. After the crop is cut they are allowed into the fields to browse upon the stubble, or are driven to the swamps when the water falls. In the Katigara tahsil there is a considerable area of low land that makes an excellent grazing ground in winter, the best known *haors* being the Thulang, the Talkar, the Rowar, the Dubria, and the Duba. In the hills, there is never any scarcity of grazing for the buffaloes and mithun (*bos frontalis*) which are the only cattle kept by the hill men. In this portion of the district there are a considerable number of professional graziers, Nepalese by race, who were attracted there at the time when the railway was being made. In the plains, the buffalo-keeper who lives by selling milk and *ghi* is only found in the Chatla *haor* and the Katigara tahsil, and even there he is by no means a common figure.

The most common forms of cattle disease prevalent Cattle disease. in the district are foot and mouth disease, rinderpest (*guti*), a disease called *kachua*, the principal symptoms of which are flatulence and diarrhoea (*marki*), cholera,

matikhoa the first symptom of which is, as the name implies, the eating of earth followed by dysentery, and *sukuna* when the animal refuses to eat and dies after ten days or a fortnight.

Tea—
Character of
gardens.

Measured by the standard of value the most important crop that is raised in Cachar is tea. The tree was discovered growing wild in Cachar in 1855, and the first plantation was opened in mauza Barsangan in 1856. The gardens were at first laid out on the flat tops of the low spurs which project from the Barail towards the Barak. The area here available was unfortunately not large, and south of the river planters turned to undulating land and the low round-topped hills called *tilas*, which are dotted about the surface of the plain. When these hills are cleared of jungle the soil is little inferior to that of the plateaux, which is of a chocolate colour, but the surface mould is washed away by the heavy rains, and the land in consequence loses much of its fertility. In 1875, the experiment was tried of planting out tea on low marsh land which had been thoroughly drained, and it was found that the rich soil yielded an exceptionally large return of leaf. The smaller drains are placed at intervals of about 80 feet apart, and in pure peat considerable allowance has to be made for shrinkage of the soil when drained. In some cases *bil* land has sunk as much as four or five feet, and the tea has been killed by water-logging, though in its uncleared state the site seemed suitable enough. Gardens of this kind are now to be found in every part of the district except the north and the north-west, and furnish a considerable proportion of the total crop. The quality of the tea is not as good as that produced on other soils,

but at present the difference in the market price is slight.

In the early sixties tea-planting was regarded rather as a speculation than a solid industry. A saying then in vogue in Cachar was that it was very doubtful whether it would ever pay to make tea, but that there was no doubt that it would pay to make gardens; and gardens were described as being made to sell but not to pay.* “Scarcely any one interested,” says Mr. Edgar, who was Deputy Commissioner at the time, “looked forward to obtaining his return from the produce of his tea cultivation; everyone looked forward to becoming suddenly and immensely rich by getting a piece of land, planting it out with tea, and then selling it for a vastly greater sum than he had expended on it.” Gardens were sold for 700 or 800 per cent. more than they had cost to make, and in some cases the plantations when they changed hands existed only on paper. This unhealthy state of affairs soon produced its own remedy. The crash came in 1866 when many concerns collapsed, and the period of depression continued till 1869. It was then found that people who had worked steadily were making a substantial profit, and that many of the estates of the bubble companies were doing well under careful management. The area under cultivation in Cachar was said to be 24,151 acres, which yielded 4,285,000 lbs. of manufactured tea—a quantity which exceeded that produced in the neighbouring district of Sylhet even as late as 1881. By 1882, the area under plant had risen to 48,878 acres and the yield to 12,721,000

Develop-
ment of
industry.

* Papers regarding the tea industry in Bengal, Calcutta, 1873.

lbs., which was considerably in excess of that returned from any other district in the Province. The industry continued to develop, though not as rapidly as elsewhere, and in 1898 the area under plant was 62,179 acres, and the outturn 20,898,000 lbs. Then ensued a series of favourable seasons, and though there was a decrease in the cultivated area, the yield in 1901 was 31,088,000 lbs. Statistics for later years will be found in Table VII; and in Appendix A there is a statement showing the area, labour force, and position of each garden.

Labour
supply.

There is little local labour available for work on the plantations, and most of the coolies have to be brought from other parts of India. The total number so imported during the ten years ending with 1890 was 51,894, and during the next decade it was 75,412. At the present moment the supply of labour in the recruiting districts is quite inadequate, and the dearth of coolies is a source of inconvenience. Waste land suitable for the growth of rice is not, as a rule, to be found either on the grants themselves or in their neighbourhood; and coolies when they leave the gardens are compelled to settle in the remoter parts of the district, where their labour is lost to the industry. The cost of importation is considerable, and few people would be willing to expend large sums of money in bringing up labourers to the district, without some guarantee that for a time, at any rate, they would be able to retain their services. This guarantee is afforded by Act XIII of 1859, which empowers a magistrate to order a man who has taken an advance of money on account of work to be done by him, to complete his contract, and to

punish him with imprisonment if he declines to carry out this order. The number of cases in which the coolie is actually confined is, however, small.

In the early days of the industry the mortality amongst the imported coolies was extremely high, and the relations between the planters and their labour force were often far from satisfactory. The mortality in transit too was very heavy. Between May 1868 and January 31st, 1868, 52,155 coolies were imported to Cachar, of whom 2,456 or 4·7 per cent. died during the voyage. As, even at that time, the journey occupied less than a month, the rate of mortality can only be characterised as appalling. This has, however, happily been changed, and, in 1902-03, the death-rate

	Number.	Per-centage.	amongst adult coolies in Cachar was only 27 per mille.

Four distinct varieties of wild tea are recognised: Varieties of plant.
 Assam indigenous, which has a leaf from 6 to 7½ inches in length by 2⅔ to 2⅞ inches in width; Manipur or Burma indigenous with a larger, darker, and coarser leaf than the preceding variety; Lushai or Cachar indigenous, whose mature leaf is from 12 to 14 inches long and from 6 to 7½ inches wide; and the Naga indigenous which has a long and narrow leaf. In addition to these four varieties there is the China plant, and different

kinds of hybrids. The China tea is a squat and bushy shrub with small leaves, which gives a lower yield per acre than the other kinds. It is many years since China seed was planted out in new clearances, and considerable areas covered by this plant have been abandoned. In its natural state the indigenous plant attains to the dimensions of a tree, varying from 20 to 50 feet in height, though its girth seldom exceeds two feet. It has a vigorous growth and yields a large outturn of fine flavoured tea, but is delicate when young. Of the hybrid variety there are many qualities ranging from nearly pure indigenous to nearly pure China. The Burmese plant, which has a smaller and darker leaf than the variety found in Cachar and the Lushai Hills, is the one which is most in favour with the planters of Cachar. It comes into bearing quickly, is fairly hardy, and yields a good outturn of tea per acre. The following gardens are noted for the excellence of the seed raised on them: Kalain, Jatinga, Kasipur, Alyne, and Goabari. Owing to the period of depression through which the industry has recently been passing, the price of seed is much lower than it was and ranges from Rs. 20 to Rs. 40 per maund.

**System of
cultivation.**

The seed is planted in nursery beds in December and January and kept under shade till the young plants are three or four inches above the ground. Transplanting goes on between April and July, whenever there is rain, the plants being usually placed from four to five feet apart. During the first two years of their life little more is required than to keep the plantation clear of weeds. By this time the plants are from two to four

feet high, and at the end of the rains they are pruned down to fifteen inches or a foot to encourage lateral growth. In the third year the plant can be lightly plucked over, but the yield of leaf is small. Pruning is continued every year. Only about two inches of the wood formed since the previous pruning are left, and any unhealthy or stunted branches are removed. As an extreme remedy old plants, in which there is a large proportion of gnarled and twisted wood, are sawn off level with the ground, and fresh shoots are allowed to spring from the root itself. Warm, moist weather is required for the proper development of the plant, but anything in the shape of waterlogging has to be carefully avoided. During the rains the garden is hoed over several times, in order to render the soil permeable to rain water and the roots of the bush. At the end of the rains the ground is hoed up to the depth of eight or nine inches. The object of this is to protect the land from drought, as the hoed up soil prevents the evaporation of water from the lower strata. It also adds to the fertility of the land by exposing it to air, light, and changes in temperature. Manure has hitherto been little used. Oil cake and cowdung are sometimes spread about the plants, and exhausted land is sometimes top dressed with rich soil from a neighbouring marsh. The cost of these operations is considerable, and they are not invariably successful from the pecuniary point of view. Plucking is started at the beginning of March and is continued till Christmas. The bud and the two top leaves are taken from each shoot, but fresh leaves soon appear, and, in about five weeks' time, the shoot is ready to be plucked again. This

throwing out of new leaves is termed a flush, and there are usually six or seven full flushes in a season, though each bush is picked over at the height of the season every seven or eight days, as the twigs develop at different times. The plucking is usually done by women and children, while the men are engaged in hoeing up the ground around the plants. The plant is liable to be attacked by a large number of pests, the best known being the tea mosquito or blight, the green fly, the red spider, thread and grey blight, and red rust. A full account of these pests will be found in "The pests and blights of the tea plant," by Watt and Mann, Calcutta, 1908.

System of
manufac-
ture.

When the leaf has been taken to the factory, it is spread out in thin layers on trays and allowed to wither. In fine weather the process takes about 18 hours, but, if it is cold and wet, from 36 to 40 hours may elapse before the leaf is ready. On these occasions recourse is often had to artificial withering. When the leaf has been properly withered it is placed in the rolling machines. The object of rolling is to break up the cellular matter and liberate the juices, and to give a twist to the leaf. Rolling takes about half an hour, and after this the leaf is spread out in a cool room for six hours or so to ferment. It is then rolled for another quarter of an hour and placed on trays in the firing machines, through which hot air is driven, until the last trace of moisture has been expelled, and the tea is crisp to the touch. The leaf is then passed through sieves of varying degrees of fineness, and the tea sorted into different grades. The best and most expensive quality is called orange pekoe

and is made from the bud or tip, which contains all the good qualities of tea in a more concentrated form than any of the other leaves, is stronger, and has a more delicate flavour. The other grades which are differentiated by the size of the mesh through which they pass are orange pekoe, broken pekoe, souchong, and fannings. After the tea has been sorted it is fired once more to remove any moisture it may have absorbed from the surrounding atmosphere, and is packed in lead-lined boxes while it is still warm. The leaf loses largely in weight during the process of manufacture, and green leaf yields only 28 or 24 per cent. of tea. In the case of plant grown on *bil* land the proportion is even lower.

The yield per acre is higher in Cachar than in most of the districts of Assam, and is on the average about 500 lbs. of manufactured tea. This is, however, only a rough general average, and different gardens and different seasons vary largely from this mean. A good *bil* garden will sometimes give as much as 1,400 lbs. per acre. Prices vary considerably from year to year, but the development of the industry has not unnaturally been accompanied by a great decline in the amount paid for the manufactured article. In 1868, it was said that tea would have to be sold at 2s. a pound in London to cover the cost of manufacture,* and, in 1882, the Deputy Commissioner complained that the average price had fallen to 1s. 2d. a pound., which was a serious matter as few gardens could produce their tea for less than a shilling. Since that date there has been a great reduction in the

Outturn
and prices.

* Report of the Commission appointed to enquire into the state and prospects of Tea Cultivation in Assam, Cachar, and Sylhet, Calcutta, 1868, p. 14.

cost of production, and, in 1908, though the average price was only $6\frac{1}{2}d.$ a pound. the results of the season were considered far from unsatisfactory.

Green tea.

Of recent years an attempt has been made to introduce the manufacture of green tea in order to meet the demands of the American market. In 1902, the Indian Tea Association offered a bounty of $1\frac{1}{2}$ annas on every pound of green tea manufactured. The following year this bounty was reduced by half, and nearly a million pounds of green tea were exported from Cachar. The principal difference between the manufacture of green and black tea is that the former article is not fermented. As soon as the leaf comes in, it is steamed in a drum for about half a minute; a process which turns it a bright green colour and effectually stops all fermentation. Excess moisture is then removed by a hydro-extractor or centrifugal machine, and it is then rolled, fired, and sorted into the following different grades, pinhead gunpowder, gunpowder young hyson, hyson no. i, hyson no. ii, twanky and dust. The infused leaf should be of a bright green colour, and the liquor of a very pale yellow shade. Most of this tea is sent to North America, but a small quantity is sold in the Midlands.

Forests
Area.

The forests of Cachar fall into two main classes, the reserves and the unclassified state forests. Unclassified state forest is, however, nothing more nor less than waste land at the disposal of the Government, and does not of necessity possess any sylvan characteristics. In 1908-04, the area of the reserved forests was returned as 807 square miles. The alteration in the southern boundary of the district, which was carried out in 1904, transferred a

portion of these reserves to the Lushai Hills, but they remain for departmental purposes under the forest officer stationed at Silchar. The area of unclassified state forest was 711 square miles, but this does not include the area of waste land in the North Cachar subdivision. The population of this subdivision has a density of about 12 to the square mile,* but the *jhum* system of cultivation, which from time immemorial has been practised by the inhabitants, is very unfavourable to tree growth.

The Barail reserve is situated in the North Cachar Hills, a little to the north of Maibang, and the Langting Mupa forest lies to the north of Katigara. All the other reserves are situated in the southern portion of the district, where they form a compact block, 692 miles in area, with one thin arm thrown out to Baladhan along the eastern frontier. The forests in the south are situated on low hilly country, much broken up with valleys. These hills are, for the most part, covered with mixed deciduous and evergreen forest; but where they have been *jhumed*, trees give place to bamboo scrub. Low swampy valleys are covered with canes and reeds, higher ones with tree growth. Details with regard to the area, date of constitution, and characteristics of each reserve over ten miles in area, will be found appended to this chapter. The receipts from each of these forests are shown in Table VIII.

The following are the most valuable timber trees found in the district, and the uses to which they are generally put. House posts—nagesvar (*mesua ferrea*), jarul (*lagerstroemia flos reginae*), gomari (*gmelina*

* This figure excludes the temporary railway population.

arborea), *sundi*, and *ramdala* (*duabanga sonneratioides*). Beams—*cham* (*artocarpus chaplasha*), *rata* (*dysoxylum binectariferum*), *kurta* (*isonandra polyantha*), *jhalna* (*terminalia bicolorata*), *tailo* (*castanopsis indica*), *ramdala*, *dewa* (*artocarpus lakoocha*), *poma* (*cedrela toona*), *sida* (*lagerstroemia parviflora*). Furniture—*rata kurta*, *poma*, *gundroi* (*cinnamomum glanduliferum*), *cham*, *kathal* (*artocarpus integrifolia*), and *dewa*. Agricultural purposes—*gomari* and *jam* (*eugenia* sp.). Tea boxes—*tula*, *dhumboil* (*beilschmiedia sikkimensis*), *am* (*mangifera sylvatica*), *kadam* (*anthocephalus cadamba*), *simul* (*bombax malabaricum*), *sutrong*, *haris* (*albizzia stipulata*), *odal* (*sterculia villosa*), *hortuki* (*terminalia citrina*), *satri* (*alstonia scholaris*), and *sita*. Railway sleepers—*nagesvar* and *sida*. Dug-out canoes—*cham*, *poma*, and *simul*. Boats—*nagesvar*, *jarul*, *cham*, and *poma*. Firewood—*chalita* (*dillenia indica*), *sita*, and *buara*. Perfumes—*agar* (*aquilaria agallocha*).

System of
manage-
ment.

The reserved forests are under the general control of a Forest Officer, assisted by a suitable staff. In unclassified state forests, settlement holders are allowed to graze their cattle, and to remove any forest produce other than reserved trees, free of charge, provided that it is required for home consumption and not for sale. Professional herdsman pay a fee of 8 annas for each buffalo and 4 annas per head of other horned cattle.

System of
extraction.

The first step to be taken by a timber trader is to apply for a permit for the trees he wishes to extract. The trees selected are marked by an officer of the

* In the Inner Line reserve, whence most of the timber is obtained, previous marking is not required.

department, and can then be felled.* After felling they are cut up into logs, dragged to the nearest stream, made up into small rafts (*khatais*), and floated out of the forest. Trees whose specific gravity is greater than that of water are buoyed with bamboos. Lower down the river the *khatais* are made up into larger rafts (*chalis*), and taken to one of the revenue stations at Sonaimukh, Silchar, and Siyaltek. Royalty can be paid either at Silchar or Hailakandi, or at Katigara tahsil office; and, on the production of the treasury voucher, a pass is issued and the produce can be removed. Timber may not be landed before it has reached a check station, except under the written authority of the forest officer. The rates of royalty on timber in the rough vary from one to four annas per cubic foot, according to the character of the tree. On bamboos there is a duty of Rs. 2-8 per thousand.

There is a brisk trade in timber in Cachar, and from ^{Timber Trade.} Table IX it will be seen that in this district the department is able to make a profit. The outturn of timber from the unclassified state forests is, however, generally larger than that from the reserves. In 1900-01, there was a considerable revenue derived from rubber, but the trees seem to have been killed out by overtapping, and since that year very little caoutchouc has passed through Cachar. Bamboos and cane are the most valuable minor forest products in the district.

Last of Reserved Forests.

CHAPTER V.

INDUSTRIES.

Arts and industries—Lac—Weaving of cotton cloth—Eri silk—Pottery
—Saw mills—The fishing industry.

APART from tea, and two saw mills worked by European ^{Arts and industries.} capital, the industries of Cachar are of very small importance. They include weaving, the making of rough pottery, bell-metal utensils, iron hoes, daos, and simple agricultural implements, and the expressing of mustard oil. The following statement shows the number of persons in the Cachar Plains, who returned these various industries as their means of livelihood, at the censuses of 1891 and 1901. From this it is clear that they can be of but little importance in the economy of an area, which in the latter year had a population of 414, 781, souls.

	Workers in and sellers of bell-metal, etc.	Workers in and sellers of iron work.	Pressers and sellers of oil.	Makers and sellers of pots.
1891 ...	76	479	181	1,003
1901 ...	80	505	68	647

This statement would at first suggest that the oil-man's and the potter's craft were falling into disrepute,

but this is not the case. Considerably more than half the persons who practised these industries in 1891, were at the same time tillers of the soil; but in the census tables all these semi-agriculturists were shown as oil-pressers or potters as the case might be. In 1901, persons whose principal occupation was cultivation were shewn under that head, and the fact that in their leisure moments they made daos or earthen pots was disregarded. Bell-metal utensils are cast in moulds by Manipuris, but the total output is extremely small. Iron daos, axes, hoes, and sickles are made by Kamars from lumps of metal which they purchase from the local shopkeepers. Most of these blacksmiths are natives of Sylhet. Mustard oil is expressed by the ordinary bullock mill of Upper India. The industry has few followers outside the town of Silchar. Weaving and pottery are dealt with in the following paragraphs.

Lac.

Lac is only produced in the North Cachar Hills. It is generally reared on *vrhar* (*cajanus indicus*) and a plant called *kallibat*. The method of propagation is as follows: Pieces of stick lac containing living insects, are placed in baskets, and tied on to the twigs of the tree on which the next crop is to be grown. After a few days, the insects crawl on to the young branches and begin to feed and secrete the resin. They are left undisturbed for about six months, and the twigs encrusted with the secretion are then picked off. Two crops are generally obtained in the year, the first being collected in May and June, the second in October and November. The first crop is largely used for seed, and it is the second which supplies the bulk of the exported lac. Ants and the

caterpillars of a small moth sometimes do much damage to the insect, and a heavy storm at the time when they are spreading over the plant will destroy them altogether. The lac produced is exported in its crude state and is sold to the kaiyas of the Assam Valley.

Weaving is not practised as a home industry in the Weaving. plains of Cachar as it is in the Assam Valley, and the great mass of the rural population are dressed in the cheap fabrics of Manchester, and not in home-made cloth. The Jugi caste is strongly represented, but few of them now touch the loom, and such clothing as is produced is for the most part woven by Manipuris, Kukis, Kacharis, Nagas, and Mikirs. The whole question of weaving in this Province has been dealt with at great length in a Monograph on the Cotton Fabrics of Assam, published at Calcutta by the Superintendent of Government Printing in 1897. The system followed in the Assam Valley is described on pages 80 to 51, and this is the system adopted by the Jugis on such occasions as they think fit to return to their traditional occupation, and occasionally also by the Manipuris. An alternative Manipuri process is described on page 77 and 78, and the Kuki and Kachari methods on pages 64—66. In the absence of elaborate plans and diagrams, descriptions of mechanical processes of this character are extremely difficult to follow, and those curious in the matter should refer to the monograph itself. Any person who really wishes to understand the way in which the work is done, would, however, be well advised to study the subject in person, and on the spot.

Cotton
cloths
produced.

The following is a brief description of the more important local products of the loom. The *than* is a large, stout cloth made of white cotton thread, and used in the cold weather as a warm wrap. The ordinary size is 9' by 4' 6", but it is sometimes 18' in length and is worn double. The price ranges from As. 8 to Rs. 8. The *fanek* is a garment worn by Manipuri women. It is fastened under the arms above the bust, and reaches to a little below the knee. It is made of green or dark blue thread with red and yellow stripes, and the border is sometimes embroidered with flowers in cotton or silk. The price varies from Rs. 2-8 to Rs. 7. The *khesk* is a thick cloth, either, plain or striped, used as a coverlet for a bed, as a wrapper by men, and as a petticoat by women. *Kheskes* are generally from 5' to 9' in length by 8' to 6' in breadth, and cost from As. 8 to Rs. 3. The Manipuris also weave cheap mosquito curtains which are sold for from As. 8 to Re. 1-4 a set. The Kukis weave cloths called *pal*, which are not unlike the *khesk*, and most of their clothing, like that of the Mikirs and Nagas, is home made. A speciality of theirs is the *pari*, a kind of rug made of lumps of raw clean cotton woven into a coarse stout cloth and knotted tightly between the weft. The ordinary *pari* is about 8' by 4' and costs some five rupees.

Eri silk.

The Eri silk-worm is reared by Kacharis both in the plains and in the hills, but the cloth produced is generally intended for home wear and very little comes to market. The worm (*attacus ricini*) derives its name from the *eri* or castor-oil plant (*ricinus communis*) on which it is usually fed. From five to six broods are hatched out.

in the year, those which spin their cocoons in November, February, and May yielding most silk. The females, when they emerge, are tied to pieces of reed, and are visited by the males who are left at liberty. The eggs are hatched in the house and take from a week to fifteen days to mature. As soon as the worms appear they are placed on a tray, which is suspended in a place of safety, and fed on the leaves of the castor-oil plant. When fully grown they are about $3\frac{1}{2}$ inches long and of a dirty white or green colour. After the final moulting, the worms are transferred from the tray to forked twigs suspended across a piece of reed, and, when they are ready to spin, are placed on a bundle of dried plantain leaves or withered branches, which is hung from the roof of the hut. The matrix of the cocoon is very gummy, and the silk, which is of a dirty white colour, has to be spun not reeled off. Before this is done the cocoons are softened by boiling them in water and a solution of alkali. Empty cocoons yield about three-quarters of their weight in thread.

The earth used by potters is generally a glutinous Pottery. clay, which is well moistened with water and freed from all extraneous substances. If it is too stiff, some clean, coarse sand is worked up with it. A well-kneaded lump of clay is then placed on the wheel, which is fixed horizontally, and made to rotate rapidly. As the wheel revolves, the potter works the clay with his fingers and gives it the desired shape. The vessel is then sun dried, placed in a mould, and beaten into final shape with a mallet, a smooth stone being held the while against the inner surface. It is then again sun dried, the surface is polished,

and it is ready for the kiln. The collection of the clay and firewood, the shaping of the utensils on the wheel and the stacking of them in the kiln, form the men's portion of the work. The women do the polishing and the final shaping.

The instruments employed are the wheel (*chak*), which is about three feet in diameter and rotates on a piece of hard pointed wood fixed firmly in the ground, the mould (*hach* or *saf*) a hollow basin about 16 inches long by $8\frac{1}{2}$ inches deep, the mallet (*mala* or *piteni*), and the polisher (*chaki*).

The Kumhars have abandoned their traditional occupation and taken to agriculture and only manufacture a few articles in their leisure hours. The most important Kumhar villages are Joynagar, Chatla, Banraj and Kalain in the *sadr* subdivision, and Rangauti, Matijuri, Bishnupur, and Siboottar in Hailakandi. The principal articles manufactured are cooking-pots, water-jars, plates, cups, and lamps. The pottery is, however, much inferior to that imported from Bengal.

Saw mills.

Apart from tea, the only factories in which European capital is invested, are the Lakhipur saw mills at Phuler-tal, and the Barak mills at Sonaimukh. The former had an average labour force of 127 in 1904, the latter of 80. The outturn consists principally of tea boxes, for which there is a large local demand. Tea boxes are also constructed by native carpenters in Silchar.

The fishing industry.

The fishing industry is not of very great importance, and is largely in the hands of Mahimals and Dom Patnis from Sylhet. There is no trade in salt fish, and the outturn from the local fisheries has to be supplemented with

dried, and even fresh fish, brought from the *haors* and rivers of Sylhet.

The following are the nets most commonly in use :

- (1) The *pelain* is a net in the form of the letter Y which is pushed through the water by the operator, as he walks along the bed of the fishery. Price As. 6 to Re. 1.
- (2) The *jhinti* is a large variety of the *pelain* which is worked from a boat. Price Rs. 2 to Rs. 8.
- (3) The *khuti* is a square net, the opposite corners of which are fastened to the ends of two flexible bamboos which are crossed in the middle. These crossed bamboos are fixed to a stout handle by means of which the net is raised and lowered. Price Rs. 4 to Rs. 10.
- (4) The *jhaki* is a circular throw net weighted round the edge, and with a rope attached to the centre. It is thrown flat on the surface of the water, and the weights then sink and draw the outer edges of the net together. Price Rs. 3 to Rs. 6.
- (5) The *hurajal* is a drag net from 2 to 4 yards wide and 10 to 25 yards long. Price Rs. 20 to Rs. 80.
- (6) The *nupul* or Manipuri net is used both as a *khuti jal* and as a drag net, and costs from As. 8 to Rs. 8. The traps used are of two kinds. The *hogra* is a triangular shaped basket filled with twigs and brushwood, which is sunk in the bed of a stream; the *doo* is of various shapes and sizes and is worked on the principle of a lobster pot. The *polo* is like a large wicker work wine-glass which is dabbed on the mud by the person working it, any fish caught being removed through the stem.

The fisheries of Cachar are divided into two main Fisheries. classes. The Barak, the Ghagra, the Sonai Rukni, the Chiri, and thirty-six more of the larger and more important

fisheries, are put up to auction and sold to the highest-bidder. The remaining fisheries, of which there are no less than 805, are settled for a term of years with the persons who on equitable grounds appear to have the strongest claims to settlement. The revenue assessed varies from Re. 1 to Rs. 200, but in most cases is from Rs. 5 to Rs. 15. The purchaser or settlement holder of the fishery is allowed to charge the following rates on the nets or traps used. The higher rates quoted are for fisheries valued at more than Rs. 50 per annum. *Pelain*, As. 4 and As. 2; *jhinti*, As. 6 and As. 4; *khuti*, As. 12 and As. 8; *jhaki*, As. 12 and As. 8; *hura*, Rs. 5 and Rs. 4; *nupül*, As. 8, and As. 4; *hogra* and *doo*, As. 4 and As. 2; each fishing boat, Rs. 8-8 and Rs. 2.

The following are the best eating fish found in the district:—*rui* (*labeo rohita*), *chital* (*notopterus chitala*), *hilsa* (*clupea ilisha*), *sol* (*ophiocephalus striatus*), *magur* (*clarias magur*), *kai* (*anabas scandens*), *pufta* (*callichrous bimaculatus*), *vacha* (*eutropichthys vacha*).

In the hills the Kukis and Kacharis use a throw net called *len* or *jegeding* which is similar to the *jhaki* of the plains. The Kacharis also buy a long net called *jegalao* from the inhabitants of Nowgong, which they stretch across a river, so that any fish swimming up or down it become entangled in its meshes. Traps are also set at dams and in swiftly flowing water.

CHAPTER VI.

ECONOMIC CONDITION OF THE PEOPLE, COMMUNICATIONS, TRADE, TOWNS, AND LOCAL BOARDS.

Subletting—Wages—Prices—Economic Condition of the people—Social restrictions—Communications—Railways—Roads—Inspection bungalows—Bridle paths—Ferries—Water communication—Post and Telegraph—Trade—Towns—Local Boards.

THE system under which cultivators in Cachar have been allowed to hold waste land at low rates of revenue has been favourable to the growth of a tenant class. The easy terms on which land could be obtained encouraged the early settlers to extend their holdings, and the revenue assessed has not been high enough to compel them to relinquish land they did not actually require. Statistics of subtenancy were recorded at the last settlement, and showed that in the *sadr* tahsil 18 per cent. of the land under the cultivation of ordinary crops was held by tenants; in the Hailakandi tahsil 18 per cent.; and in the Katigara tahsil 20 per cent. The total area held by subtenants according to the returns, was only 16 per cent.; but the settlement officer was of opinion that 25 per cent. would probably have been nearer to the mark.

Subletting
fairly com-
mon.

Subletting is by no means common in the older parganas and the country near Silchar, as the *mirasdars* in this portion of the district have little land to spare. Tenants are proportionately most numerous in the Banraj, Lakhipur, and Chatla Haor parganas of the *sadr* tahsil; the Vernerpur pargana in the south of the Hailakandi valley; and the Kalain, Jalalpur, and Gumra parganas in the north-west corner of the Katigara tahsil. The rents paid are said to vary from Rs. 2-4-0 to Rs. 6-12-0 per acre, and cases not infrequently occur in which landlords demand and obtain them in advance. On the other hand, abatements or remissions are allowed when there is a failure or destruction of the crop. The selling value of ordinary rice land was reported by the settlement officer to range from Rs. 60 to Rs. 185 an acre. The following figures recorded at the census of 1901 give a fairly correct idea of rural society in the plains portion of the district: Cultivating land-holders, 158,080; non-cultivating landholders, 2,109; cultivating tenants, 80,256. Dependents as well as workers are included in each case. The number of tenants suggests that the settlement officer was right in doubting the accuracy of his statistics of subtenancy. The large number of cultivating landholders shows that Cachar is still a country of peasant proprietors, and that the landlord class is still numerically a small one.

Wages.

The bulk of the inhabitants of Cachar belong to castes which in other parts of India are employed as labourers. The facilities for obtaining land have, however, been so great that they have succeeded in rising to the position of peasant proprietors, or, at any rate, of cultivators; and

labour is in consequence both scarce and dear. The total number of persons supported by general labour in the Cachar Plains at the census of 1891 was only 8,751. Ten years later it was but 4,626, or barely 1 per cent. of the total population, as compared with nearly 7 per cent. in the Province of Bengal. The natural result is that wages are extremely high. Even in 1876, a common labourer was given as much as Rs. 7 per mensem in addition to his food. The rates quoted at the present day range from Rs. 4 to Rs. 8 per mensem with food, and from Rs. 7 to Rs. 10 if the man is required to feed himself. The wage for daily labour ranges from As. 4 to As. 8 a day, but, in spite of the high rates offered, it is the common complaint that labourers are scarce and difficult to procure. In the Hailakandi subdivision it is said that though the vast majority of the people are of a very low class, they decline to work for hire, either because they are *mirasdars* themselves or the relations of *mirasdars*.

Mirasdar is a sufficiently high-sounding title, but all that it connotes is that the man in question holds direct from Government. The holding is often not more than two or three acres in extent, and the great majority of the *mirasdars* drive the plough themselves, and differ in no respects from the ordinary raiyat of the Assam Valley. By old custom, which dated from the time of the Kachari Rajas, the ownership of land carried with it the obligation to supply portorage to Government. This practice was only recently abolished, but in spite of the fact that the bulk of the *mirasdars* of Cachar belong to castes which rank low in the Hindu social

scale, that nearly all of them cultivate their land with their own hands, and that the work in question was sanctioned by ancient usage dating back to the times of native rule, the great mass of the villagers preferred to suffer pecuniary loss to undertaking work which in their estimation was degrading. It seems to have been originally the practice for the wealthier *mirasdars* to bribe their poorer neighbours to act as coolies, by the offer of a bonus ranging from Re. 1 to Re. 1-8 per day, in addition to the wage of 6 annas received from the employer. Subsequently all the labour was provided by natives of Sylhet, under the control of daffadars, who appropriated a portion of the bonus paid for the coolie. The system of impressment has been discontinued since 1904, but the enormous price paid for unskilled labour suggests that the general level of prosperity in the district must be unusually high. In the North Cachar subdivision labour is still fairly cheap, and is paid from As. 2 to As. 4 a day. When the work is given out on contract the charge for weeding an acre of land varies from Re. 1 to Rs. 2. The Kacharis are the principal employers of labour in the hills, and engage Rangkhoh or Bete Kukis, Mikirs, or Nagas. The Kacharis seldom work for hire themselves, and never except amongst their own people.

Prices.

During the last forty years there has been a marked rise in the price of rice. In the ten years ending with 1872, 20·2 seers of rice were on the average to be procured for a rupee. In the next decade, the average sank to 18·5; then to 14·9; and in the ten years ending with 1902, to 11·9. This period was, however, one of considerable

stringency; the Cachar market was no doubt affected by the prices ruling in other parts of India, and it is doubtful whether the average for the current decade will reach so high a level. Twenty-three seers of rice were, for instance, procurable for a rupee at Hailakandi during the second half of February, 1905. Rice is generally appreciably cheaper at Hailakandi than at Silchar. This is, however, probably due to the fact that Hailakandi is only a small village in a rice-growing valley. The total volume of business transacted there is very small, and in the absence of any demand in the village, prices tend to keep low. Salt has cheapened considerably of recent years, but pulse shows a steady tendency to rise. Further details with regard to prices will be found in Table X.

The economic condition of the people must be considered fairly satisfactory. The soil is fertile, the rainfall regular and abundant, and the bulk of the cultivated land lies above the risk of flood. Communications are fair, and last and most important fact of all, the cultivator finds a market for his produce at the various bazars scattered about the district, to which the garden coolies come to satisfy their wants. At the time of the last re-settlement, an attempt was made to divide the villagers into the following five classes: (1) *Mirasdars* who derive their chief income from rents; (2) *Mirasdars* who sublet part of their land but are substantial cultivators themselves; (3) *Mirasdars* who cultivate the whole of their land and neither sublet nor rent; (4) *Mirasdars* who have to rent land in addition to their own holdings; (5) Tenants who own no land. Less than 2 per cent.

Economic
condition of
the people.

of the total number were included in the first two classes. Nearly two-thirds of the whole fell in the category of peasant proprietors who neither paid nor received rent, less than a seventh in Class IV., and rather more than a quarter were found to be landless tenants. The actual figures recorded, which only refer to the householders themselves and not to those dependent on them, are as follows: Class I, 78; Class II, 598; Class III, 22,494; Class IV, 5,882; Class V, 9,200. They are described by the settlement officer as having no pretensions to accuracy, though they may be taken as a fair approximation to the truth.*

Is indebted-
ness com-
mon?

The extent to which indebtedness exists is a question of some importance, but is one with regard to which it is difficult to obtain reliable information. The local revenue officers, who have been recently consulted, state that from 60 to 75 per cent. of the population are in debt; though they admit that in the majority of cases the debtor could discharge his obligations, if he would take service or do other work when not engaged on agriculture. It is difficult to believe that these statements can be correct. The land revenue assessment is light, and only amounts to Re. 1-8-5 per head; the incidence of the excise revenue was only Re. 0-8-11 per head in 1902-08; and there is a large foreign population who must, to a great extent, supply their wants from the produce of the villagers. On June 30th, 1908, there were 71,578 adult coolies in the Cachar Plains, and assuming—an estimate that seems moderate enough—that each of them

* *Vide* Cachar Re-assessment Report forwarded to the Chief Commissioner with letter No. 2987, dated 8th July, 1898, from the Officiating Director of Land Records.

spent Rs. 25 a year on the products of the district, they would put some 18 lakhs of rupees in circulation amongst the villagers. This would amount to Rs. 6-8 per head for each man, woman and child in the plains of Cachar outside tea gardens and Silchar town in 1901.

In a matter of this kind considerable weight must be attached to the opinion of the settlement officer, Rai Sarat Chandra Banerji Bahadur. His estimate differs entirely from that submitted by the local revenue officials, and on *a priori* grounds would seem to be much nearer to the truth. The settlement officer says no.

“In regard to the actual indebtedness of the people, it is not of course very easy to form an estimate. The point was one of the items set down for enquiry during the classification operations, and has been noted upon more or less carefully in regard to every village. The statement of the *mirasdars* themselves in such a matter had to be accepted with considerable reserve. Large allowances had to be made for the natural anxiety to convince the assessing officer that, generally speaking, the people were in an abject state of poverty. The fact that there were evident signs to the contrary had necessarily no deterrent effect against sweeping statements of misery, or against the assertion that, unless the rates of assessment were reduced to what they were before the current settlement, everybody would starve. Rather careful enquiries were made in the Katigara tahsil as to the number of persons actually in debt in each village, and tested by the existence of money bonds; and the result would go to show that the number of householders who had contracted debts formed about 10 per cent. of the whole, and that about a tenth of these, or 1 per cent., were rather heavily in debt.”

According to the same authority, the rate of interest varies with the amount of money borrowed. For sums under Rs. 20 the usual rate is 75 per cent., though in parts of the *sadr* tahsil it is only 60 per cent., and in the Vernerpur pargana, 48 per cent. For sums between Rs. 20 and Rs. 50, 75 per cent. is occasionally paid; but 48 or 60 per Rates of interest.

cent. is the more usual rate. For loans of between Rs. 50 and Rs. 100, the rate varies from 80 to 60 per cent., and is usually about 48 per cent. Money is borrowed for the purpose of paying for a wife, or land, or cattle, or lawyer's fees, and sometimes to pay land revenue. The last-named obligation is, however, usually discharged by the sale of surplus paddy, vegetables, poultry, goats, and even cattle. In 1902, the Deputy Commissioner reported that there had been a marked advance in the economic condition of the district. Ready-made coats and shirts had come into common use, and there was a large demand for boots, umbrellas, cigarettes, and other foreign luxuries. Judged from some points of view the standard of comfort is still perhaps not high. The food eaten by the villagers is cheap and simple; their houses are small, dark, and ill-ventilated; their dress is not elaborate or costly. It seems, however, fairly clear that the wealth-producing capacities of the people are but slightly taxed, and that they have a great reserve of labour still untapped. A large proportion of the villagers grow little else but rice, and it is obvious that it does not take a full year's work to raise a harvest of that cereal. In a district where, a couple of years ago, a cooly impressed for Government could earn from one-and-a-half to two rupees a day, it is difficult to believe that there could be much of poverty or debt.

North
Cachar.

The economic condition of the Kacharis, Nagas, and Jansen Kukis, is described as satisfactory. They grow enough rice to last them through the year, there are patches of sugarcane and vegetables round their houses, and in the semi-permanent Naga villages there are

gardens of guavas, mangoes, pomegranates, and peaches. The Mikirs, who are, however, a comparatively small community, are said to be most improvident and unthrifty and to be nearly all of them in debt. Their creditors are the Kaiyas of Assam, who give them advances and buy their cotton at much below the market value. Neither they nor the Rangkhoh Kukis grow enough rice to last them through the year, and the quantity of opium they consume is a very serious drain on their resources.

There seem to be few restrictions on trades and handicrafts in Cachar. Jugis have almost entirely given up their traditional occupation of weaving, with the idea that this abstention will raise them in the social scale. In the Assam Valley a large part of the clothing worn by the people is made at home, but in Cachar the Manipuris are the only persons who utilize the leisure hours of their women in this way. The rearing of silkworms is said to be restricted to the Kacharis, and in this way another useful source of wealth is closed to the people of the plains.

Prior to the construction of the Assam-Bengal Railway, communications with the outside world were kept up by steamer. During the rainy season big steamers came up the Barak to Silchar, but in the cold weather there is often barely three feet of water in the channel, and at this season of the year the journey from Calcutta to Silchar occupied five days. On the opening of the railway, this slow and irksome journey was reduced at once to 88 hours, passengers travelling by steamer from Chandpur to Goalundo, and thence by the Eastern Bengal State Railway to Calcutta. The steamer service

Social
restrictions

Communica-
tions.
Steamers.

is still maintained, the vessels being owned and managed by the India General Steam Navigation Company and the Rivers Steam Navigation Company. The ports of call in Cachar for the large steamers which ply on the Barak are Badarpur, Siyaltek, Jatingamukh, and Masimpur. In the rains, feeder steamers go up the Barak from Silchar to Lakhipur; up the Madhura to Chandighat; up the Ghagra to the Hattia rocks; and up the Katakhal to Kukichara.

Railways.

The Assam-Bengal Railway enters the district at a point a little to the east of Badarpur junction, which is 252 miles from Chittagong. Here the line divides, and a branch line runs south of the Barak, past Katakhal, Salchapra, and Ghagra to Silchar, which is 18 miles from Badarpur. The main line after leaving the junction crosses the Barak on a magnificent bridge, which is 454 yards in length, and had the foundations of its piers carried to a depth of 80 feet below the bed of the river. It then winds its way up the Jatinga valley, and so makes its way through the North Cachar Hills into Assam. The following is a list of the stations in the district north of the Barak; the figures in brackets show the mileage from Chittagong: Bihara (262); Damchara (271); Harangajao (283); Jatinga (294); Haflang (308); Mahur (312); Maibang (327); Langting (343); Hathikhali (355). Luming in the Nowgong district, which is the junction for the Gauhati branch, is 12 miles beyond Hathikhali.

The Hill section runs for the most part through shale of the worst description, often intermixed with bands of kaolinite, which swells when exposed and causes

heavy slips ; or exerts immense pressure on the sides of tunnels. To counteract this pressure, very heavy masonry was required ; cuttings had to be arched in, and special measures taken to allow the drainage to escape. Though the hill section is only 118 miles in length, it contains 24 tunnels, 7 covered ways, and 74 major bridges, the longest being 650 feet, the highest 118 feet above the river bed ; while many of the banks and cuttings approach 100 feet in height and depth respectively. Apart from the special engineering difficulties, great inconvenience was experienced, owing to the absence of local labour and food supplies, and to the unhealthiness of the country traversed. At one time in addition to the railway material, food for over 25,000 men had to be carried into the hills on elephants, bullocks, ponies, and other pack animals. The result is that the cost of construction of the hill section has been extremely heavy. In the plains, the railway has brought Cachar, which, prior to 1898, was a remote and isolated district, within easy reach of Calcutta. In the hills it has already begun to attract settlers to the valleys of the Jatinga, the Doiang, and the Mahur ; but it has not yet been open long enough for its effects to be fully felt.

The heavy rainfall combined with the extraordinary- Roads. ly tenacious character of the clay, has always rendered the question of road communications a serious problem in Cachar. In 1858, there was only one road in the district, and that had not been repaired for years.* In 1866 there were six roads under the ferry fund board,

* Statistical Account of Assam by W. W. Hunter, Vol. II, page 425.

which had an aggregate length of between 50 and 60 miles.* In 1904, there were altogether 201 miles of road and 193 miles of bridle path in the plains portion of the district. In spite of the existence of all these miles of cart road, goods are still, to a great extent, carried by cooly or pack bullock. In the matter of wheeled traffic, the inhabitants of the Surma Valley have shown a singular lack of initiative and enterprise. Driving roads have been in existence for many years, yet in 1902 there were only 260 carts in Cachar, as compared with upwards of 3,500 in the district of Darrang. In this respect their neighbours on the east have put them quite to shame. Carts were first sent into Manipur in 1896, the people were not slow to grasp the advantage of wheeled transport, and a few years later there were no less than 1,700 carts plying between Imphal and the Assam Valley.

Principal
roads in
Plains.

The trunk road enters Cachar at Badarpur, 51 miles from Sylhet, and crosses the Manipur frontier at Jirighat, 40 miles from Badarpur. There are dâk bungalows at Badarpur, Salchapra, and Silchar, and inspection bungalows at Salchapra, Lakhipur, Jirighat and Banskandi. Most of the minor streams are bridged, but ferries ply across the following rivers; the figure in brackets represents the mileage from Badarpur: Dhaleswari (2); Pola (8); Katakhal (6); Ghagra (12); Barak (20); Chiri (27); and Jiri (40). From Silchar, a driving road runs south, then turns west and passes Hailakandi, and finally runs due north till it meets the trunk road a little to the east

* Dacca Blue Book, page 366.

of Badarpur. North of Hailakandi, the Burnimukh road takes off on the east to Salchapra railway station. South of Hailakandi, two roads, which ultimately merge in one and sink to the status of a bridle path, run towards the Lushai Hills, and there are numerous minor roads and bridle paths branching off east and west, which have been constructed to serve the various tea gardens in the vicinity. East of Silchar there is the Maniarkhal road, which is not fit for wheeled traffic after Sonaimukh, and several bridle paths. North of the Barak there is the Natwanpur bridle path, which runs westward to the Jaintia Parganas, the Damchara, Nemotha, Sibarbund, and Baladhan paths, with various other minor paths branching from them. The road system is, however, too complicated to be described in detail, and can be more readily understood by referring to the map which accompanies this volume.

In addition to the ones already mentioned, there are inspection bungalows at Bikrampur and Gumera on the Natwanpur road; at Barkhala on the Jatinga valley road; at Tikalpur on the Durganagar road; at Udharband on the Scottpur Udharband road, at Sonaimukh on the Maniarkhal road; at Narainpur on the Burnimukh road, at Lala, Katlichara, Jalinga, and Maragang on the Jhalnachara road; and at Kanglai on the Aijal road.

In the North Cachar Hills there is a bridle path from Haflang to the hot springs, which is continued through Jowai to Shillong. There are rest-houses at the following places; the figures in brackets show the mileage from Haflang: Gunjong (16); Derebara ($24\frac{1}{2}$); Baga (32); Khorungma ($40\frac{1}{2}$); Hot springs (52). From

Inspection
Bungalows.

Paths in
North
Cachar.

Gunjong there is a bridle path to Doiangmukh (42 miles), and from Doiangmukh to the hot springs (40 miles). There are no rest-houses on either of these paths. From Maibang a bridle path runs to Baladhan, 56 miles away, with rest-houses at Guilong (8 miles), Laishung ($17\frac{1}{2}$ miles), and Hangrum ($26\frac{1}{2}$ miles). From Laishung a path strikes eastward to the border of the Naga Hills district 21 miles away.

Ferries.

The extreme rapidity with which the rivers rise after rain, renders the construction of permanent bridges over the larger streams a matter of some difficulty and of great expense. Ferries are in consequence largely used, and there are over 100 in the plains portion of the district. In the cold weather, when the rivers fall, they are often spanned by temporary bamboo bridges.

In addition to the lines of steamers to which reference has been already made, country boats play an important part in the transport business of the district. They are of the ordinary heavy type which covers the rivers and streams of Eastern Bengal. The following statement shows the navigable rivers of the district, and the highest point to which a boat of four tons burthen can proceed in the rains and in cold weather :—

NAME OF RIVER.	HIGHEST POINT TO WHICH BOAT OF 4 TONS BURTHEN CAN PROCEED.	
	In cold weather.	In rains.
Amjur	Not navigable	Up to Thaukim punji.
Badri	do.	Narainpur Tea Estate.
Barak	Tipaimukh	Kacharballi.
Bohali	Not navigable	Thaukim punji.
Chiri	do.	Joypur bazar.
Dalu	do.	Dalugram Tea Estate.
Dhaleswari Katakhal	do.	Bhairabicharamukh.
Ghagra	do.	Barajalinga bazar.
Jatinga	do.	Balichara Tea Estate.
Madhura	do.	Pathichara Tea Estate.
Mara Dhaleswari ...	do.	Ainakhal Tea Estate.
Rukni	do.	Lushai boundary.
Salganga	do.	Derby Tea Estate.
Sonai	Maniarkhal Tea Es- tate.	Chhotanatia.

The following statement shows how enormous was the development of postal business during the last forty years of the century; nearly 35 letters and post-cards being delivered in 1908-04 for every one that came to hand in 1861-62:—

Number of post offices in 1903-04.	Number of letters and post- cards omitting thousands delivered in			Number of Savings Bank accounts in		Balance at the credit of the de- positors.	
	1861-62.	1870-71.	1903-04.	18 71-72.	1903-04.	1871-72.	1903-04.
30	20	71	694	11	3,808	Rs. 6,300	Rs. 7,08,000

The mail is brought by the Assam-Bengal Railway from Calcutta to Silchar, and distributed by runners to the different post offices in the plains. A statement showing the places at which post and telegraph offices are situated will be found in the Appendix.

The savings bank has also made much progress, and considering the low rate of interest allowed and the scarcity of capital in the district, the volume of deposits is considerable. The figures given for 1872 were returned after the bank had only been open for a short time; but on the data then before him the Collector hazarded the opinion that the bank was not likely to succeed at all.

**External
Trade.**

The import trade is chiefly in the hands of foreign shopkeepers, the most important articles brought into the district being rice, which is required for the large cooly population, flour, betel-nuts, salt, sugar, *ghi*, cotton piece-goods, kerosine oil, coal, and iron and steel. The only important articles of export are tea, which is shipped direct from the gardens, and timber and other forest produce. More than half of the total weight of the trade still (1903-04) enters or leaves the district by water. Manipur exports to Cachar timber and other forest produce, cattle, and Indian piece-goods; and receives in return European piece-goods and twist, dried fish, and betel-nuts. Forest produce is floated down the rivers. Other articles are carried on men's backs or sometimes on pack bullocks.

**Internal
Trade.**

The internal trade of the district is carried on at markets which are held on certain specified days in the week, at the more important of which there are generally

several permanent shops. After Silchar itself, where there are upwards of 470 shops, the principal business centres are Udhharband on the Madhura river, Sonaimukh at the junction of the Sonai and the Barak in the Sonapur pargana, and Barkhala near the Jatinga river. A list of the bazars, showing the days of the week on which they are held, and a list of all places in which there are three or more permanent shops will be found in the Appendix. Most of the shopkeepers are natives of Sylhet, Bengal, or the United Provinces, and very few of the indigenous inhabitants of the district have attempted to appropriate any portion of the profits that accrue from retail trade. The number of Marwari merchants is also very small. The village shopkeeper usually deals in grain and pulse, *ghi*, oil, sugar, molasses, salt, tobacco, spices, umbrellas, and piece-goods. The villagers come to the bazars on market days, bringing with them rice or paddy, fruit, vegetables, goats, and poultry. In addition to the weekly markets, a large fair is held every year in March on the north bank of the Barak opposite Badarpur. Upwards of 15,000 people are said to attend, and there is a considerable amount of business done.

Silchar is the only place in the district which has any pretensions to the name of town. It is situated on the left bank of the Barak in 24°49'N. and 92°48'E. and commands a charming view down the river, which is dotted with the sails of native craft and lined with groves of the areca palm, while, a little to the north, the purple hills of North Cachar rise sharply from the plain.

The town itself has a somewhat tumble-down

Towns:
Silchar.

appearance, and, with the exception of the church and the new circuit house, does not contain a single building of any size or dignity. The houses of the Europeans stand round a piece of open ground, which becomes very wet and swampy in the rains. The business quarter lies a little to the south, but there are few substantial merchants in Silchar. There is a considerable trade in rice, European piece-goods, timber, and other forest produce. Tea boxes are manufactured by native firms, and there is a small printing-press, at which a vernacular paper is published. The place has been growing steadily in size during the last thirty years, the population at the last four enumerations being 1872, 4,925; 1881, 6,567; 1891, 7,528; and 1901, 9,256. As in most of the other towns in Assam the bulk of the population is of foreign birth. Silchar was constituted a municipality under Act V (B.C.) of 1876 in 1898. There are twelve commissioners, eight of whom are non-officials and are elected, while four are nominated, and two hold office *ex-officio*. The principal tax imposed is one ranging from $6\frac{1}{4}$ to $7\frac{1}{2}$ per cent. on the annual value of holdings. From Table XVII it will be seen that much of the municipal revenue has been raised from the fees levied in the market and at the ferry, and from grants from other funds. The total area of Silchar is 2.4 square miles, and it is served by 18 linear miles of road, 10 of which are metalled. The town is lighted by 98 lamps, and there are three reserved tanks and four wells from which drinking water can be obtained.

Hailakandi. Hailakandi is not large enough to be dignified by the name of town. It contains the subdivisional court,

thana, and lock-up, a dispensary, high school, and tahsil office, but the total population of the place in 1901 was only 1,838 souls. It is, in fact, simply a small village surrounded on every side by rice fields.

Haflang is situated on the top of a hill, 3,117 feet **Haflang.** above the level of the sea, on the north side of the main section of the Barail range. The subdivisional magistrate's court was transferred to this place from Gunjong in 1896, as it then began to acquire considerable importance as the headquarters of the hill section of the Assam-Bengal Railway. The station is prettily laid out, and commands a fine view of some of the highest peaks of the Barail, whose summits are nearly 6,000 feet above the level of the sea. The place is, however, entirely a creation of the railway, and apart from the presence of the Subdivisional Officer and his staff, has no importance.

In 1872, the management of the district roads was **Local Boards.** entrusted to a committee presided over by the Deputy Commissioner. The funds at their disposal were partly obtained from tolls and ferries on local roads and other miscellaneous sources, but principally from grants made by the Bengal Government from the amalgamated district road fund. In 1874, when Assam was erected into a separate Administration, the Government of India assigned one-seventeenth of the net land revenue for local purposes. The district improvement fund was then started, and the administration of its resources was as before entrusted to the Deputy Commissioner assisted by a committee. The actual amount placed at their disposal was not large, and, in 1875-76, the total income of

the district funds of the province was only Rs. 1,85,000, which was a small sum in comparison with the twelve and a half lakhs of rupees received by the Local Boards in 1908-04. In 1879, a Regulation was passed, providing for the levy of a local rate, and the appointment of a committee in each district to control the expenditure on roads, primary education, and the district post. Three years later the district committees were abolished by executive order, and their place was taken by boards established in each subdivision, which are the local authorities in existence at the present day. The Deputy Commissioner is Chairman of the board of the headquarters subdivision, and the Subdivisional Officer is Chairman of the Hailakandi Board. The Local Boards are entrusted with the maintenance of all roads within their jurisdiction, except the provision and maintenance of local staging bungalows and dispensaries, and the supervision of village sanitation, vaccination, and the district post. They are also in charge of primary education, subject to the general control of the Education Department, and are empowered to make grants-in-aid to schools of higher grade, subject to certain rules. For these purposes, they have placed at their disposal the rate which is levied under the Assam Local Rates Regulation of 1879, at the rate of one anna per rupee on the annual value of lands, as well as the surplus income of pounds and ferries, and some minor receipts. This income is supplemented by an annual grant from provincial funds. The principal heads of income and expenditure are shown in Table XXII.

CHAPTER VII.

GENERAL ADMINISTRATION.

Native system of land revenue administration and early British settlements—The settlement of 1884—The settlement of 1900—Expansion of settled area since 1830—Waste land available for settlement—Disforestation—Different forms of land tenure—Incidence of land revenue—Land revenue collection—Town lands—Opium—Country spirit—Ganja—Laopani—Income-tax—Stamps—Public works—General administration—Criminal and civil justice—Registration—Volunteering—Police—Jail—Education—Medical.

THE following account of the revenue system of Cachar ^{Land revenue.} under native rule, and of the earlier settlements made by British officers, is reproduced from the Statistical Account of Cachar by Sir W. W. Hunter :—

The following paragraphs are mainly condensed from the 'Annual Report on the Revenue Administration of Cachar for 1871-72':—The first settlement of Hindus in the District is placed about 200 years ago, in the reign of Raja Suradarpa Chandra. The tradition runs that in his reign, an Assami Hindu named Bikram Rai was sent from the capital of Dimapur into that part of Cachar now known as Bikrampur, to encourage the settlement of Bengali immigrants from the west. Among other founders of colonies, the names are mentioned of Asu Thakur from Pratapghar in Sylhet, and the ancestor of the family now represented by Gulal Khan Chaudhari from Tipperah. By the time that Kartik Chandra came to the throne, the number of

colonists was very considerable. At first the rents were extremely low, the earliest mentioned rates being a he-goat, a pair of fowls, a duck, and two cocoanuts from each holding, irrespective of its size. Subsequently the rent was fixed at 12 annas for each *hal* (about 4d. per acre). Kartik Chandra raised the rate for the *hal* to Rs. 3; and it is said that Gobind Chandra, the last of the Cachar Rajas, obtained from some lands as much as Rs. 6 per *hal*, or about 2s. 6d. per acre. The lands, which of course were originally under jungle, were settled not with individuals, but with corporations called *rajs*. Each *raj*, again, was subdivided into minor corporations or *khels*, which formed the real units of the revenue system. Each individual in the *khel* was held jointly and severally liable for the revenue assessed on the *khel*, and similarly each *khel* was responsible for the payments of its *raj*. The *khel* elected its own mouthpiece, known as a *mukhtar*. Certain portions of the area allotted to each *khel* was appropriated rent-free to persons of standing; and of the lands remaining, every man received as much as he could cultivate. The system of rent-free grants was discontinued by Gobind Chandra, but the influence and recognised position of the grantees endured long afterwards. In the early days of British administration the chief titles within the *khel* were sold by Government at the following rates:—*Chaudhari*, Rs. 100; *mazumdar*, Rs. 75; *lashkar*, Rs. 60; *bara-bhuiya*, Rs. 50; *majar-bhuiya*, Rs. 25. The head-men of the *raj* and *khel* were primarily responsible for the revenue, which was collected in the following fashion:—A Cachari peon was sent to the house of the head-man with a demand for payment. The head-man then sounded a drum, or fired a gun if the demand was urgent. When the people came together the revenue was forthwith collected. Defaulters, after being allowed a short respite, were arrested and brought before the Raja. If it appeared that they had no means, the sharers in the *taluk*, or separate estate, were invited to enter upon the defaulter's land, on condition of satisfying the arrears. If they declined, the holding was given to the *khel*. If the *khel* failed to pay, the land lapsed to the *raj*, which could not refuse. In no case were outsiders admitted. The term *khel* was also applied to certain localities, which either had to supply the Raja with certain definite commodities, such as betel-nuts or firewood, or the rents of which were assigned to certain functionaries of State. Thus *Paikan khel* was the name of an estate, the rent of which was devoted to the expenses of worshipping the goddess Ran Chandi; *Vishnughar khel* was appropriated to Lakshmi Narayan; *Bhisingsa khel*, to Shama or Kali.

Cachar lapsed to the British in 1830, and Captain Fisher assumed charge of the District in July of that year. He continued the native revenue system which he found in force. The terms were that for all cleared lands revenue should be paid at the rate of *sikka* Rs. 4-12, or Company's Rs. 5-2 per *kulba* or *hal* (about 2s. per acre); *bari* or the sites of houses, *chara* or garden-lands, and tanks, etc., were altogether exempt; while jungle was revenue-free for the first 1,000 days of its occupation, and then assessed at rates varying from Rs. 2-12 to Rs. 3-8 per *hal* (1s. 1d. to 1s. 5d. per acre). Captain Fisher appears to have made a rough survey of the cultivated lands under his charge, by which a total of 20,663 acres were assessed at *sikka* Rs. 20,101, equivalent to Company's Rs. 21,441, leaving an additional area of about 9,000 acres revenue-free as *baksha*, *debottar*, etc.

About the year 1834 there ensued a series of unusually wet seasons. The people were unable to cultivate their fields, and the revenue fell into heavy arrears. The attention of the Board of Revenue was called to the high rates of assessment, and in 1838 Major Burns, who had succeeded to the office of Superintendent on Captain Fisher's death, was instructed to make a new settlement on more easy terms. This settlement was based on Captain Fisher's imperfect survey. The period was for five years, terminating in April 1843. The highest rate of rice-land was Rs. 3 per *hal* (about 1s. 3d. per acre); the rent for *chara* land was fixed at Rs. 2-8 per *hal* (about 1s. per acre); *bari* land remained revenue-free as before; while jungle land was settled revenue-free for 1,000 days, and thereafter at the current rates. The area assessed was 36,430 acres, of which 6,261 acres were jungle; the revenue fixed was Rs. 24,974, rising to Rs. 26,985 at the expiration of the term of settlement.

In 1841 Lieutenant (now General) Thuillier was deputed to survey the District, and the work was finished by the close of the following year. This survey comprised an area of 182,378 acres. The lands bordering the principal rivers and streams, to which cultivation was then limited, were actually measured and divided into 241 *mauzas*. For the rest, arbitrary lines were cut through the jungle, so far as it was reasonably supposed that the work of reclamation would extend in the immediate future; and the tracts included within these lines were marked on the map as *dags*. Great difficulties afterwards followed when the area of these *dags* was taken up for cultivation. The tea grants for the most part lay beyond the limits of the survey, and each grant when subsequently made was constituted an independent *mauza*.

In 1842, Deputy Collector Galak Chandra Rai Bahadur was specially deputed from Sylhet to make the new settlement which is known by his name. The term was to be for fifteen years; the rates fixed by the expiring settlement for cultivated lands were to be continued; the old settlement-holders were to be recognised; and the work was to be conducted in accordance with the results of the survey just completed. The Rai Bahadur's settlement comprised an area of 97,904 acres, of which 30,043 were jungle-lands; the revenue was fixed at Rs. 43,146, rising ultimately to Rs. 58,518. Both *chara* and *bari* lands were assessed at rates varying from Rs. 3 to Rs. 2 per *hal* (1s. 3d. to 10d. per acre); but all *lakhiraj* granted before the District came under British administration was strictly respected. Jungle land was assessed rent-free for the first five years, at Re. 1-8 per *hal* (7d. per acre) for the next five years, and at full rates for the concluding five years of the term. At the termination of the rent-free period, it was found that the *miras-dars* had taken up more jungle than they were able to cultivate. They were accordingly permitted by the Board of Revenue to relinquish portions of their holdings upon terms. But the reduction in the total of the revenue caused by such relinquishments was more than compensated by additional settlements of jungle-land, made from time to time to expire with the currency of the fifteen years' settlement. The number of new estates thus added was 1,458, with an area of 35,288 acres, and a revenue of Rs. 20,302. The general result was that in 1854-55, there were altogether 7,773 estates on the rent-roll of the District, paying a revenue of Rs. 67,660.

In 1855-56 Major Verner, who was then in charge of Cachar, effected the settlement of certain tracts of jungle land for a period of fifteen years, at rates varying from 4 annas to Rs. 3 per *hal*. Some of the terms of this settlement do not expire until the year 1879. Altogether 972 estates were settled by Major Verner, with an area of 70,216 acres, and an ultimate revenue of Rs. 37,123. By this means, when the Rai Bahadur's settlement expired in 1857-58, the total land revenue amounted to Rs. 81,676.

In 1858-59 a new settlement of the District was undertaken by Captain Stewart, the expiring settlement having been in the interval provisionally extended for one year. The new term was for twenty years, which will not expire until 1879. The proceedings were based upon Lieutenant Thuillier's survey; and a native surveyor, or *amin*, was deputed to measure lands not included in the map. For purposes of assessment all the cultivated lands were divided into two classes, according to their

productive powers. The rates at which first-class land was assessed ranged from Rs. 3-8 to Rs. 2 per *hal* (about 1s. 5d. to 10d. per acre), according to advantages of situation; and those at which second-class land was assessed, from Rs. 3 to Rs. 1-8 per *hal* (about 1s. 3d. to 7d. per acre). Jungle-producing thatching grass and reeds was settled at the full rates charged for cultivated lands in the same neighbourhood. Forest land that required much clearing was settled rent-free for the first three years, and then at rates gradually rising to the full rates charged for adjacent land. The number of estates was reduced by amalgamation from 8,470 to 6,120, covering an area of 132,542 acres, and paying a minimum revenue of Rs. 90,631. These figures are exclusive of the jungle land settled previously by Major Verner. Fresh settlements of jungle land were made from time to time for periods terminating with Major Stewart's settlement in 1879.

Preparations for the next settlement were commenced in the cold weather of 1878-79, but the work was not completed till 1884. Each of the three tahsils of Silchar, Katigara, and Hailakandi, was divided into four circles, and rates were fixed in accordance with the assessment capacity of each circle. The rates for the first circle were the same in each tahsil, but for the other circles, there was a considerable difference between the tahsil rates, *e.g.*, fourth circle homestead land paid Rs. 6 per *hal* in Halikandi, but only Rs. 4-12 in Katigara. Land was divided into four classes: (1) homestead and garden; (2) cultivation, including land under san-grass; (3) tea; and (4) waste. The rate for tea varied from Rs. 6 to Rs. 7-2 per *hal*, and waste was uniformly assessed at Re. 1 per *hal*, or 8 annas 4 pies per acre. The acre rates assessed on homestead varied from 15 annas 9 pies to Re. 1-11-0, and on cultivation other than tea, from 12 annas 8 pie to Re. 1-7-6. The total increase of revenue brought out by the settlement

The settle-
ment of
1884.

was Rs. 60,000 or nearly 88 per cent. The cost of the operations was Rs. 3,63,000, which swallowed up the whole of the enhancement for the first six years.

The settle-
ment of
1900.

The current settlement, which was carried out between the years 1894 and 1899, came into force in April 1900, and will expire in 1915. In imposing rates, a distinction was drawn between land under rice and land under ordinary staples other than rice, and the village was, to some extent, abandoned as the unit of assessment, distinctions being drawn between good and bad rice land in the same village. The class of the village was, however, usually held to be the same as the class of the bulk of the rice-land of which it was composed; and homestead and land growing other crops than rice, followed the village class. The following statement shows the rates assessed per *bigha*,* and the proportion of land of each description falling in each class:—

	HOMESTEAD.		RICE.		OTHER CROPS.		WASTE.	
	Rate per bigha.	Percentage of total in.	Rate per bigha.	Percentage of total in.	Rate per bigha.	Percentage of total in.	Rate per bigha.	Percentage of total in.
	As.		As.		As.		As.	
Class I ...	13	46	11	42	8	37	2	} 38
„ II ...	11	28	9	30	7	30	1	
„ III ...	8	17	7	19	5	19	...	} 60
„ IV ...	6	9	5	8	4	14	...	
„ V ...	...	...	4	1	...	...	...	...

* One acre is equivalent to 3.025 *bighas*.

The gross increase of revenue amounted to Rs. 1,48,944 or nearly 47 per cent., but in the greater part of the district the whole of this enhancement was not brought into force at once. In all villages in which the increase was as much as 88 per cent., the enhancement was spread over a period of either eight or twelve years. The total cost of the settlement was Rs. 8,92,000, which absorbed the whole of the increase of revenue for the first four years of its currency. An important feature of this settlement was the breaking up of the joint *mahals* owned by co-parcenary bodies, into *raiayatwari* holdings of the ordinary type. The change was appreciated by the people, and was carried out without difficulty.

The following statement shows in a concise form the area covered by each successive settlement and the initial revenue demand:—

Expansion
of settled
area since
1830.

	1830.	1838.	1848.	1859.	1884.	1900.
Settled area, acres ...	20,663	36,430	97,904	132,542	252,645	378,464
Revenue, Rs. ...	21,411	24,974	43,146	90,631	2,22,730	4,00,672

It is a noticeable fact that, though the acreage assessment in 1900 was higher than that imposed at most of the preceding settlements, it is almost identical with that in force no less than 70 years before. The enormous increase that has occurred in the settled area, is obscured by the fact that the above table only takes account of land actually under re-settlement at the time. It does not include revenue-free grants, or the estates that had been settled in fee simple, or under leases which

had still some time to run. The total settled area of the district in 1880 was 29,852 acres, but by 1902-08 it had risen to 607,466 acres, that is to say, in the comparatively short space of 72 years it had increased more than twenty-fold.

Settled
waste land.

Cachar differs from Assam Proper in the fact that waste land is held on specially low rates. In the Brahmaputra Valley land settled under the ordinary rules pays full rates of revenue whether under crop or not; and the result is that very little waste is held under ordinary patta.* In 1900, it was found that nearly 84 per cent. of the land held by ordinary villagers in Cachar was waste, and over 70 per cent. of the land included in the tea estates. The proportion of waste in the settled area of the district as a whole was no less than 51 per cent. The Settlement Officer was, however, of opinion that the great bulk of the waste land settled under ordinary lease was more or less unculturable, and was only fit for grazing or the growth of fuel.

Waste land
available
for settle-
ment.

The existence of a low rate for waste must obviously act as an inducement to take up land, and to retain it as long as there is any hope of bringing it under the plough, and the result is that the proportion of culturable land which is still unsettled is very small. The following statement shows the percentage of the total area of each tahsil at the last settlement which was (a) unsettled, and (b) classed not only as unsettled but also as culturable :—

* Nowgong, 1902-08. Total area settled at full rates excluding land settled with planters, 199,383 acres. Net cropped area excluding land cropped with tea, 197,273 acres.

		Percentage of total area unsettled.	Percentage of total area unsettled and culturable.
Silchar	tahsil ...	... 12.16	6.0
Katigara	,, ...	... 13.07	4.6
Hailakandi	,, ...	... 7.86	3.2

The expression culturable is, however, somewhat loosely used, and the Settlement Officer admits that the only parganas in which there is really any unsettled land which is fit for cultivation, are Davidsonabad, Bhuvan Hills, and Lakhipur, all of which lie on the outskirts of the *sadr* tahsil. There is a considerable area of so-called culturable unsettled land in parganas Haritikar and Lebherputa in the Katigara tahsil, and near the Chatla *haor*, but consisting as it does of marsh and fen, it would not do for permanent cultivation or habitation, though parts of it might perhaps afford a cold-weather crop.

There can be little doubt that there is a real and <sup>Disforesta-
tion.</sup> genuine demand for land in Cachar. To meet this demand, steps were taken to throw open to cultivation a portion of the forest reserves which occupy so large a proportion of the district. In 1896, the Dhaleswari reserve, which covered an area of 22,164 acres in pargana Vernerpur, was disforested.* Unfortunately a great part of this forest proved to be quite unfit for cultivation, and only about 7,000 acres were available for settlement. About 4,000 acres had been allotted by April 1st, 1902,

* The figure 22,164 acres includes two villages covering an area of 1,893 acres settled on the same terms.

the rates charged being 12 annas an acre for flat and 8 annas an acre for hilly land, with a revenue-free period of three years. In the following year 8,600 acres of the Barak reserve, which covered altogether an area of 75 square miles, were declared available for settlement. Only 1,300 acres were found to be fit for cultivation, and almost the whole of this area was very soon allotted. No revenue was charged for the first three years of the lease, but on the expiry of this period the land was assessed at the rate of 15 annas an acre. Two years later 6,728 acres, or more than half the total area of the Sonai reserve, were disforested. The greater part of this land was, however, included within the boundaries of a grant and had been wrongly formed into a reserve; and only about 1,800 acres were available for settlement. Practically the whole of this was allotted without delay. Similar concessions were made in the same year with regard to 10,500 acres of the huge Inner Line reserve, which covered an area of 509 square miles in the south-east corner of the district. The greater part of this land was reported to be culturable, and nearly 7,000 acres had been allotted by May 1st, 1902. Both of these settlements were made at the rate of 15 annas an acre. The net result of these operations was that about 18,600 acres were rendered available for settlement, of which 18,600 acres had been allotted by April 1st, 1902.

Various
forms of
tenure.

In the Assam Valley it has been for many years the policy of Government to settle waste land on favourable terms for the growth of tea, but this concession was not extended to those who wished to cultivate the ordinary staples of the Province. No such restriction was

originally in force in Cachar, and in the preceding pages it has been shewn that the practice of allowing a revenue free period when settling waste land, dates from the time when the British first took possession of the district. In 1864, the *Jangalburi* or waste land reclamation lease rules were sanctioned. For the first three years the land was revenue-free, during the next fifteen the rates varied from 8 annas to 12 annas an acre, and during the last twelve years the assessment was Re. 1-8 per acre. On the expiry of the lease the lessee, or his successor in interest, could only claim resettlement of such portion of the land as had been already cleared and cultivated, unless he had succeeded in bringing three-fourths of the estate under cultivation, when he was entitled to resettlement of the whole. In 1875, these rules were revised, and the term of the lease reduced to 20 years. The rates imposed were 2 years, revenue-free; 4 years at 8 annas per acre; four years at 6 annas per acre, and 10 years at 12 annas per acre; and the clearance conditions were withdrawn. On the expiry of these leases the land was resettled at the full rates prevailing in the neighbourhood. The rules were superseded by those issued in 1894, which are still in force. A revenue-free period is no longer allowed except under the special orders of the Chief Commissioner, and theoretically the land becomes liable to assessment as soon as it has been taken up. A revenue-free period and reduced rates have, however, been granted to all settlers in the disforested area, and the number of new settlements of land in other portions of the district is necessarily small.

Special
rules for
settlement
of tea lands

The first rules to be introduced into Cachar for the grant of land for tea cultivation, were the old Assam rules of 1854, which were extended to the district in 1856. One-fourth of the grant was exempted from assessment in perpetuity. The remaining three-fourths were granted revenue-free for 15 years, and then assessed at 8 annas an acre for 10 years and at 6 annas an acre for 74 years more, the total lease being thus for 99 years. Large tracts of land were taken up under these rules, but most of the owners took advantage of the permission accorded to them under the fee simple rules, to convert their leases into a fee simple tenure, and the total area now held under the 99-years' lease rules of 1854 is 25,728 acres.

The fee
simple rules

The fee simple rules were first issued in 1861 and modified in the following year. Except under special circumstances grants were limited to an area of 8,000 acres, the land was put up to auction, and the upset price ranged from Rs. 2-8 to Rs. 10 per acre. These rules were in force till 1872. In 1874, revised fee simple rules were issued which raised the upset price to Rs. 8 per acre; but they were superseded by the thirty years' lease rules of 1876. In 1902-08, 142,751 acres of land were held in Cachar on fee simple tenure.

The thirty
years' lease
rules.

Under the thirty years lease rules the land is sold at an upset price of Re. 1 per acre, and is held for two years revenue-free. It then pays 8 annas an acre for the next four years, and 6 annas an acre for another four. For the next ten years it pays 8 annas, and for the last ten years of the lease Re. 1 per acre. The total area held on thirty years' lease in 1902-08 was only 5,038 acres, planters

in many cases having preferred to take up land under the *Jangalburi* rules of 1882 which did not differ materially from the rules of 1875. Under executive orders the issue of leases for thirty years under Section I of the Settlement Rules has been discontinued in the plains of Cachar.

Two other tenures require notice. Bakshas are ^{Bakshas, etc.} grants of revenue-free land made by the Kachari Rajas to members of their own race. They are exempt from assessment so long as they are not alienated. In 1902-03, they covered an area of 1,227 acres. A special concession has also been made to a family of mirasdars in the Sonapur pargana, who were granted a remission of half their land revenue as a reward for good services performed on the occasion of the Lushai expedition of 1869. This concession extends to the generation subsequent to that of the original grantee, but the total area affected is little more than one square mile.

The result of the low rate assessed for waste and ^{Incidence of land revenue.} the comparatively low rate assessed on cultivation, is that the incidence of land revenue is much lighter in Cachar than in Assam Proper. In Cachar the incidence per acre of the fully assessed area in 1902-03 was Re. 1-1-4; in Assam Proper it ranged from Rs. 2-1-10 to Rs. 2-10-8. The incidence per cultivated acre in Cachar in that year was Rs. 1-13-1; in Assam Proper it ranged from Rs. 2-6-10 to Rs. 3-0-0. The incidence per head of population was Re. 1-1-4 in Cachar, while in Assam Proper it ranged from Re. 1-11-10 to Rs. 2-7-1.

At the time of Mr. Mills' visit to the district in 1853, land revenue was collected at three tahsils situated ^{Land Revenue collection.} at Silchar, Katigara, and Hailakandi. In 1859, Mr. Allen

reported that the revenue was collected with punctuality, and that recourse was seldom had to the distraint and sale of personal property. Land was not sold for arrears of revenue, but if an estate defaulted it could be transferred to any person who paid the arrears of the defaulter. This somewhat singular rule appears to have worked fairly well, and between 1853 and 1858 only 19 estates had changed hands in this manner. The three tahsils remained unchanged for many years, but owing to the extension of cultivation, and enhancements of the rates of revenue, the amount to be collected at the *sadr* tahsil had risen by 1901 to upwards of Rs. 2,85,000. Some inconvenience was experienced in collecting such a large sum at a single office, and in 1903 four *mauzas* were formed consisting of (1) Pargana Chatla Haor, (2) Pargana Banraj, (3) Parganas Rupairbally and Lakhipur, and (4) Parganas Bhuban Hill and Davidsonabad. The demand of the *sadr* tahsil was by this means reduced to Rs. 1,65,000. In 1905, the Katigara tahsil also was split up into three *mauzas*. Revenue is due in three instalments, one-fourth on August 1st, one-fourth on November 1st, and one-half on March 1st.

When a raiyat defaults, a notice of demand is served upon him.* If this proves insufficient, the moveable property, or, in the absence of a sufficient quantity of moveable property, the estate itself, can be attached and sold. In 1903-1904, notices of demand issued on account of 7 per cent. of the total land revenue demand, and

* The Deputy Commissioner has recently been authorised to dispense with this notice of demand, if he considers it desirable to do so, and to proceed at once to attachment.

property was attached on account of 4 per cent. The proportion of the land revenue on account of which property or land had actually to be sold was, however, only 0·1 per cent.

Silchar town was settled for a period of thirty years Town lands. with effect from April 1902. The highest rates assessed per acre on trade sites were Rs. 75, rising in the eleventh year to Rs. 105; and on residential land Rs. 86, rising to Rs. 48. On certain special trade sites frontage rates were assessed varying from Rs. 8-8 to As. 8 per cubit. Under the rules now in force, waste land taken up for the first time within town limits is to be settled ordinarily for a term of thirty years, at a fair rent not exceeding the annual letting value of the site. The lease of the land applied for may, if the Deputy Commissioner thinks fit, be put up to auction and knocked down to the highest bidder. The rates assessed in Hailakandi are those imposed in ordinary first class villages.

Opium is not much in favour with the inhabitants Opium. of the Surma Valley, and in 1902-08 the total revenue raised from opium in the Cachar Plains only amounted to Rs. 85,000. This is an insignificant sum in comparison with the Rs. 5,12,000 raised in Lakhimpur, a district which has a smaller population. The hill tribes of North Cachar, and more especially the Mikirs, are, however, much addicted to the drug. The total opium revenue raised per head of population (excluding persons censused on the railway) in the hills in 1902-08 was Rs. 2-3-9 as compared with Re. 0-1-4 per head of population in the plains. Details as to the number of shops and

revenue raised from opium in each subdivision will be found in Table XV.

The drug is generally swallowed in the form of pills, or mixed with water and drunk. *Madak* is made by mixing boiled opium with pieces of dried pan leaf, and stirring it over the fire. The compound is then rolled up into pills and smoked. *Chandu* is made out of opium boiled with water till the water has all evaporated, and is smoked like *madak* in the form of pills. Opium is not generally smoked in Assam, and this form of taking the drug is usually supposed to be more injurious than when it is simply swallowed.

Country-
spirit. The
still.

Country spirit is manufactured by native methods and generally in what is known as the closed still. The apparatus employed consists of a large brass or copper retort which is placed over the fire, to the top of which is fitted an earthen jar. The wash is placed in the retort, and as it boils rises in the form of vapour into the earthen jar whence it passes down two tubes into two receivers where it is cooled and condenses into liquid. These tubes are so fixed to the receivers that the air cannot have access to the spirit, and though distillation does not proceed so rapidly, the liquor produced is stronger than that obtained from the open still.

Material
employed.

The material employed is either the flower of the *mohwa* tree (*bassia-latifolia*), which contains a very large proportion of sugar, or molasses and rice. *Mohwa* is generally used by up-country distillers, and, as the foreigners, who form a large part of the liquor-drinking population, prefer the *mohwa* spirit, its use is spreading amongst the Sunris who some years ago generally distilled from

molasses. The following are the proportions in which these ingredients are generally mixed: *mohwa* 80 seers and water 60 seers; or *mohwa* 25 seers, molasses 5 seers, and water 60 seers; or boiled rice 20 seers, molasses 10 seers, and water 80 seers. *Sustu*, the refuse wash which remains in the retort after the distillation, is sometimes used in place of water. *Muli*, a substance composed of leaves, roots, and spices, whose actual ingredients are not divulged by the villagers who manufacture it, is frequently added to the wash, which is put to ferment in large earthenware vessels, which, to economise space, are often sunk up to their necks in the floor of the shop. Large earthenware vessels are cleansed before they are filled with wash by heating them with hot ashes or ropes of straw which are allowed to smoulder for some hours inside; smaller vessels are usually washed with water. Fermentation takes three or four days in summer and a week in the cold weather, and the wash is then considered to be ready for the still. The process of distillation takes about three hours.

A retort of 40 gallons yields two gallons of spirit in an hour-and-three-quarters, three gallons in two-hours-and-a-quarter, and four gallons in three hours. The best and strongest spirit comes off first, and in the case of a brew of 80 seers of *mohwa*, the first $8\frac{1}{2}$ gallons will be classed as *phul* if they are at once drawn off from the receiver. If they are allowed to remain while two more gallons are distilled, the whole $5\frac{1}{2}$ gallons will be classed as *bangla*. The exact proportions vary, however, at the different shops, some distillers taking $4\frac{1}{4}$ gallons of *phul* or $5\frac{1}{4}$ gallons of *bangla* from 30 seers of *mohwa* Different grades of spirit.

Occasionally only two gallons of spirit are distilled from 80 seers of *mohwa*, and the liquor is then called *thul*, is very strong, and is sold for one or two rupees a quart. *Thul* is also sometimes made by redistilling *bangla*. Only one kind of liquor is generally taken from each distillation, as, if the *thul* or *phul* were removed, the spirit subsequently distilled would be not only weak but impure. Strong liquor watered to reduce it to a lower strength is not considered palatable, and it seems to be the usual practice to distill the liquor at the actual strength at which it will be sold. One disadvantage of the cheaper kind of liquor is that it will not keep, and in four or five weeks it is said to lose all its spirituous qualities.

Number of
shops and
revenue.

	No. of shops.	Revenue. Rs.
1873-74	141	43,596
1879-80	72	27,317
1889-90	50	76,067
1899-1900	35	1,29,948

From the abstract in the margin it will be seen that a considerable expansion of the revenue under the head of country spirits has been accompanied by a great diminution in the facilities for obtaining liquor:—

For every four shops in 1873-74, there was only one in 1899-1900; yet like the Sibylline books, the aggregate value of the shops increased as their number was diminished. This was due to freer competition at the auction sales, which enabled Government to divert into the treasury a portion of the profits of the trade. Table XV shows the number of country-spirit shops in each subdivision, and the amount for which they are sold.

Reforms in
excise ad-
ministration.

Though few complaints have been received with regard to the administration of the liquor laws in Cachar, it cannot be denied that in the neighbourhood of some liquor shops, drunkenness and disorderly conduct are not uncommon. The attention of Government has been

more than once directed to the most effective measures for the mitigation of this evil. The outstill system is not theoretically the most desirable, but in a district like Cachar where communications in the rains are difficult it is not altogether easy to find anything to take its place. The following measures have recently been introduced with the object of reducing, as far as possible, the evils attendant on the liquor trade. A special excise establishment has been entertained, the vendor is required to arrange for an abundant supply of good drinking water near his shop, and his license can be withdrawn if he is twice convicted of allowing drunkenness and disorderly conduct near the still. The shops must be closed on market days and holidays at 4 P.M. in winter and 6 P.M. in summer. The maximum quantity of liquor which may be sold to a purchaser has also been reduced from six quart bottles at a time to three quart bottles in a day.

Ganja is usually mixed with water, kneaded till it becomes soft, cut into small strips, and smoked. Ganja is fairly popular in the Surma Valley, and Cachar yields a larger revenue from this drug than any district in the Province except Sylhet. Full details with regard to the ganja revenue of each subdivision will be found in Table XV.

Laopani or rice-beer is the national drink of the unconverted tribes. It is also taken by some of the humbler Hindu castes, and is largely used by garden coolies if facilities are not afforded to them for obtaining country-spirit. The following is the usual system of manufacture followed. The rice is boiled and spread on

a mat, and *muli* is powdered and sprinkled over it. After about twelve hours it is transferred to an earthen jar, the mouth of which is closed, and left to ferment for three or four days. Water is then added and allowed to stand for a few hours, and the beer is at last considered to be ready. The usual proportions are five seers of rice and three chattaks of *muli* to half a *kulsi* of water; and the liquor produced is said to be much stronger than most European beers. Liquor is often illicitly distilled from *laopani* or boiled rice, by the following simple method. An earthen pot with a hole in the bottom is placed on the top of the vessel containing the *laopani* or rice, and the whole is set on the fire. The mouth of the upper pot is closed by a cone-shaped vessel filled with cold water, and a saucer is placed at the bottom of the pot over the hole. The vapour rises into the upper of the two jars, condenses against the cold cone, with which the mouth is closed, and falls in the form of spirit on to the saucer beneath. Care must of course be taken to see that the various cracks are closed against the passage of the spirituous vapour, but this can easily be done with strips of cloth.

Income Tax.

The receipts under the head of income tax in 1904 amounted to Rs. 28,879, about one-half of which was derived from the salaries paid to garden managers and their subordinates. Other sources of income yielded Rs. 10,730, which was paid by 182 assesses, the great majority of whom were engaged in commerce and trade. This class included 18 money-lenders, 29 contractors, 44 dealers in food-grains, and 11 dealers in piece-goods. Only 15 professional men were assessed to income tax,

14 of whom were pleaders. There has been a considerable expansion under this head of revenue in Cachar. The receipts in 1888 amounted to Rs. 25,800 and by 1899 had risen to Rs. 88,500. The decrease which occurred in 1904 was largely due to the effect of Act XI of 1908, which raised the minimum taxable income from Rs. 500 to Rs. 1,000 per annum.

The receipts under the head of judicial stamps in 1908-04 amounted to Rs. 66,788. Cachar stood second in the list of districts, but the revenue obtained was less than a sixth of that which was realised in Sylhet. Rs. 29,089 were derived from non-judicial stamps, a figure which was largely exceeded by Sylhet and very slightly by Lakhimpur.

Public works are in charge of an Executive or Assistant Engineer who is usually assisted by two upper and three lower subordinates. The Public works Department are entrusted with the construction and maintenance of all the larger public buildings. The most important are the jail, the public offices, schools and post and telegraph offices at district and subdivisional headquarters, circuit-houses, dak bungalows, and inspection bungalows on provincial roads. Inspection bungalows on other roads are maintained by the Local Boards. The most important lines of communication which are directly under the Department are (1) the road from Badarpur through Silchar to Jirighat on the Manipur frontier; and (2) the road from Silchar across the Chatla haor through Somairkona to Hailakandi. A little to the north of Hailakandi it divides into two branches, one going to Badarpur the other to Salchapra railway station.

It has already been explained that Local Board works that require professional skill or engineering knowledge are usually made over to the Executive Engineer for execution. The principal difficulties with which the Department has to contend are the absence of an artizan class, and the scarcity and dearness of unskilled labour. It is to these two causes that the heavy cost of public works in Cachar is largely due.

General Administration.

For general administrative purposes the district is divided into three subdivisions. Silchar is under the immediate charge of the Deputy Commissioner, who is allowed as his immediate assistants three subordinate magistrates and a sub-deputy collector. Hailakandi is entrusted to an assistant magistrate, who is almost invariably a European, and who is allowed a sub-deputy collector as his assistant. The North Cachar Hills are administered by a European Officer of Police who exercises judicial powers. The Deputy Commissioner is not only District Magistrate, but he is also District, though not Sessions, Judge. In addition to his purely magisterial and judicial functions, he is responsible for the harmonious and efficient working of the various departments of the administration which are described in the following pages.

Criminal and civil justice.

Appeals lie to the Deputy Commissioner from orders passed by magistrates of the second or third class, and from the orders of first-class magistrates to the Sessions Judge of Sylhet who is also the Sessions Judge of Cachar. Appeals from the Judge lie to the High Court of Judicature at Calcutta. In 1902, there were nine stipendiary and two honorary

magistrates in the Cachar Plains. The former decided 775 and the latter only two original criminal cases. In the course of these proceedings 3,125 witnesses were examined. Altogether there were 987 cases under the Indian Penal Code returned as true, the immense majority of which were either offences against property or against the human body. There is not much serious crime and most of the offences were either theft or house trespass. The Deputy Commissioner is invested with the special powers mentioned in Sections 80 and 84 of the Criminal Procedure Code, and is authorised to impose sentences up to seven years' rigorous imprisonment.

The civil work of the district is not heavy. The Deputy Commissioner acts as the District Civil Judge, while one of the assistant magistrates in each subdivision in the plains discharges the functions of a munsif. Appeals from the decisions of the munsifs are heard by the subordinate judge of Sylhet and Cachar, who holds his court periodically at Silchar for this purpose. In 1902, the District Civil Judge* heard 14 original cases and 25 appeals, while 2,080 original suits were disposed of by the munsifs. Less than one-sixth of these suits were contested, and a large proportion of them were simple money-suits.

Special rules are in force for the administration of justice in the North Cachar Hills. The jurisdiction of the High Court is barred except on its criminal side in the case of European British subjects, and the Deputy Commissioner is empowered to pass sentence of death, transportation

North
Cachar.

* The appointment of the subordinate judge was sanctioned in 1903.

and imprisonment for fourteen years. Sentences of death, transportation, and imprisonment for seven years or upward require, however, the confirmation of the Chief Commissioner. No appeal lies as a matter of right from any sentence of the Deputy Commissioner of less than three years' imprisonment.

Registration.

The Deputy Commissioner is also the registrar of the district and there is a special sub-registrar at Silchar, and rural sub-registrars at Katigara and Hailakandi. The number of documents registered is considerable and in 1908 amounted to 7,899, a figure largely in excess of that returned from any district in the Assam Valley.

Volunteering.

A volunteer corps was first enrolled in Cachar in 1888, with a strength of 80 members, but was subsequently amalgamated with the Sylhet volunteers to form the Surma Valley Light Horse. This admirable corps had a strength in 1904 of 834 men, 156 of whom were residing in Cachar.

Police.

The civil police are in charge of a District or Assistant Superintendent of Police. The sanctioned strength consists of 1 inspector, 24 sub-inspectors, and 210 constables. Forty smooth-bore Martinis are allotted to Cachar, and a reserve of men is kept up at the district and sub-divisional headquarters who are armed with these weapons and are employed on guard and escort duty. Up-country men, Nepalese, and members of the aboriginal tribes are usually deputed to this work, though attempts are made to put all the constables through an annual course of musketry. The foundation of the police system is the village chaukidar. He is required to report

all serious crime to the officer in charge of the police station within which his village is situated, to arrest persons committing such crimes in his presence, to collect vital statistics, to observe the movements of bad characters, and generally to inform his official superiors of anything likely to affect the peace and good administration of the district. In addition to their regular duties in, connection with the prevention and detection of crime, the police are required to check the returns of vital statistics, manage pounds, enquire into cases in which death has not been due to natural causes, furnish guards and escorts, and to serve all processes in warrant cases. The district as a whole is fairly free from serious crime but murders are not uncommon, and, during the 20 years ending with 1899, seven cases of murder or culpable homicide were on the average reported every year.

In 1908, a dacoity of a very singular character was ^{Dacoity.} committed in the shop of a well-to-do trader on the Kalachara Tea Estate. All the arrangements for the crime were planned across the frontier in Afghanistan, and a gang of 27 men started for India with the deliberate intention of looting a shop in the Hailakandi valley, 2,000 miles away. Fortunately the trader was on friendly terms with another Pathan, who had been accustomed to make the shop his headquarters when he came on trading expeditions to Cachar, and this man gave information to the police. It was intended to arrest the dacoits in the very act, but they arrived earlier than was expected and succeeded in getting away with their booty. Twenty-four of the gang were, however, subsequently arrested, and were duly tried and convicted.

The chaukidar.

Under native rule an establishment of village servants, called *dakuals*, was maintained by the Raja of Cachar, and remunerated by assignments of land which were estimated to bring in about Rs. 5 per annum. When the district lapsed to the British in 1880, these grants of land were resumed, and a chaukidar was appointed to every 64 houses, each of which contributed one pice per mensem for his support. His sole duty was to report heinous offences at the police stations, and to submit from time to time reports on the state of affairs in his beat. He was not required to patrol at night, as fear of wild animals kept people at home after dark. As time went on, the pay of the chaukidar, which had never at any time been large, became more and more inadequate for his support, and he grew in consequence more and more indifferent to his duties. Matters were to some extent improved by the introduction of Regulation I of 1888, but this Regulation has not proved to be entirely suited to the conditions prevailing in Cachar. The chaukidar is left to make his own arrangement with the villagers for his pay, and he thus receives it neither punctually nor in full. Act VI (B.C.) of 1870 has been extended to the district, but has not yet been introduced, and the village police are still managed under Regulation I. Six hundred and sixty-one chaukidars were entertained in Cachar in 1903, at a total cost of Rs. 82,000.

Military police.

For many years a battalion of military police was stationed in Cachar, and prior to the occupation of the Lushai Hills, a large portion of the battalion was detailed on outpost duty. In 1888, there were three posts in the North Cachar Hills, two in the plains at their

feet, and six along the eastern and southern frontier stretching from Jirighat to Jhalnachara at the south of the Hailakandi valley. The gradual pacification of the hill tribes has rendered it possible to withdraw these small detachments, and proposals have been submitted to amalgamate the force with the Lakhimpur military police battalion and to reduce the strength to 149 officers and men. The battalion saw a good deal of active service and took part in the Lushai Hills Expedition of 1871-72, the Garo Hills Expedition of 1872, the Naga Hills Expedition of 1879-80, the Chin-Lushai Expedition of 1889-90, the Manipur Expedition of 1891, and the Lushai Expedition of 1892. The service is not unpopular and recruits are fairly easily obtained, the great majority being Gurkhas, and the remainder members of the aboriginal tribes such as Garos, Rabhas, Meches and Kacharis. The number of resignations is, however, high, as men when they first join find it difficult to live upon their pay. The guards for the treasury and jail at Silchar are furnished by the military police. The men are armed with Martini-Henry rifles mark IV, bayonets, and kukris.

There is a jail at Silchar with accommodation for 58 Jail. convicts and magistrate's lock-ups at Haflang and Hailakandi. The prisoners at Silchar are chiefly employed on gardening, oil-pressing, and rice-husking. Those who are sentenced to more than one year's imprisonment are transferred to the large jail at Sylhet.

Education is a plant of comparatively recent growth in Cachar. In the year 1856-57, there was not a single school in the district. In 1860-61, there was one unaided Education. Progress of education.

school, which was attended by only 18 pupils.* Matters began slowly to improve, and in 1865-66 seven schools† were in existence, but little progress was made till the reforms initiated by Sir George Campbell had had time to take effect. The following statement shows the progress made since 1874-75:—

YEAR.	No. of secondary schools.	Pupils.	No. of primary schools.	Pupils.	Total No. of pupils.	No. of persons in district to each pupil.	Percentage under instruction to those of school-going age.	
							Males.	Females.

High and
Middle
schools

High schools are those institutions which are recognised by the Calcutta University as capable of affording suitable preparation for the Entrance Examination. The boys are taught from the earliest stage of their education up to the Entrance course as prescribed by the University of Calcutta, but many leave school without completing the course. Till recently, English was taught in all the classes. The smaller boys no longer learn that language, but the standard of instruction is higher than that prevailing in lower secondary (middle) schools. English is the medium of instruction in the first four classes of high schools; in the lower classes and in other

* Statistical Account of Assam, Vol. II, p. 456.

† Dacca Blue Book, p. 365.

schools the vernacular is employed. There is a Government high school at Silchar, and an aided high school at Hailakandi. The course of instruction at middle English and middle vernacular schools is the same; with the exception that English is taught in the former and not in the latter. The following are the subjects taught in the middle vernacular course: (1) Bengali comprising literature, grammar, and composition; (2) History of India; (3) Geography; (4) Arithmetic; (5) Elements of Euclid (Book I), mensuration of plane surfaces and surveying; and (6) simple lessons on botany and agriculture. Middle schools are situated at Silchar, Barkhala, Katigara, and Narsingpur.

Primary education is again divided into upper and lower, but the proportion of boys in upper primary schools is less than six per cent. of the total number, and this class of school, like the middle vernacular, is slowly dying out. The course of study in lower primary schools includes Reading, Writing, Dictation, Simple Arithmetic, and the Geography of Assam. In upper primary schools the course is somewhat more advanced, and includes part of the first book of Euclid, Mensuration, and a little History. The standard of instruction given still leaves much to be desired, but efforts have been recently made to improve it, by raising the rates of pay given to the masters. Fixed pay is now awarded at average rates of Rs. 8 per mensem for certificated, and Rs. 5 per mensem for uncertificated teachers, supplemented by capitation grants at rates ranging from 8 annas to 6 annas for pupils in the three highest classes. Statistics for female education will be found in Table XXI.

Primary
Education.

As in other parts of India it has made comparatively little progress. The inspecting staff consists of two Deputy Inspectors and one Sub-Inspector. The headquarters of the Inspector of the Surma Valley are located at Silchar.

Medical.

The District is in the medical charge of the Civil Surgeon who is stationed at Silchar. It contains seven dispensaries, and the supervision of the work done at these institutions is one of the most important of his duties. He also acts as superintendent of the jail, controls and inspects the vaccination department, and is required to visit and report on all tea-gardens on which the death-rate for the previous year has exceeded 7 per cent.

The conditions under which the people pass their days are far from conducive to a long mean duration of life. Their houses are small, dark, and ill-ventilated, and the rooms in summer must be exceedingly close and oppressive. They are built upon low mud plinths, and are in consequence extremely damp, and the inmates, instead of sleeping on beds or bamboo platforms, which would cost them nothing to provide, often pass the night on a mat on the cold floor. The houses are buried in groves of fruit-trees and bamboos, which afford indeed a pleasant shade, but act as an effective barrier to the circulation of the air, and increase the humidity of the already over-humid atmosphere. Sanitary arrangements there are none, the rubbish is swept up into a corner and allowed to rot with masses of decaying vegetation ; and the complete absence of latrines renders the neighbourhood of the village a most unsavoury place. The water-supply is generally bad, and is drawn either from shallow

holes, from rivers, or from tanks in which the villagers wash their clothes and persons. All of these are undoubtedly factors which contribute to produce a high mortality, and nearly every one of them could be eliminated, but the work of purification must be done by the villagers themselves.

Vital statistics are reported verbally by the village chaukidars to the police, but the returns are far from accurate. The average recorded birth and death-rates between 1891 and 1901, worked out on the mean population of the decade, were births 80 and deaths 81 per mille. It is obvious that these figures must be wrong, but there are not sufficient data available to admit of the framing of a normal birth and death-rate for the district.

Fever and bowel complaints are the forms which death most often takes in the Cachar district, at any rate according to official returns. These returns are, however, so inaccurate, and so little reliance can be placed on the diagnosis of the reporting agency that the figures hardly repay examination. Epidemics of cholera from time to time produce a high mortality, for though it is apparently endemic in the district, it occasionally breaks out with unusual severity. The abstract in the margin shows the recorded death-rate from this cause in the years when cholera was most prevalent. The people are careless about vaccination, and the proportion so protected in the quinquennium ending with 1902-03 was not half of the proportion in the Province as a whole. The mortality from small-pox is proportionately high. The native methods of midwifery leave much to

be desired, and it is feared that the mortality in child-birth is extremely high.

Increase in
facilities for
obtaining
medical aid.

	No. Dispensaries.	No. Patients treated.
1881	2	11,632
1891	4	31,638
1901	6	43,939

Though there can be little doubt that many lives are annually lost which could be saved by proper treatment, it is satisfactory to know that of recent years there has been a great increase in the facilities for obtaining medical aid, and, in the extent to which the people avail themselves of the advantages now offered to them. From the statement in the margin it appears that for every patient treated in 1881 there were 4 in 1901, while the number of operations performed rose from 870 to 1,274 :—

The principal dispensaries are those situated at Silchar and Hailakandi. The first dispensary was opened in the district, at Silchar, in 1864. The diseases for which treatment is most commonly applied are worms, cutaneous disorders, malarial fevers, diseases of the eye, dysentery and diarrhoea, and rheumatic affections. Further information with regard to the dispensaries in the district will be found in Table XXIV.

Survey.

A professional revenue survey of the district was made at the time when Cachar was still a district of Bengal and the maps were published in 1870. They are on the scale of one inch to the mile, and show the sites of villages and the physical features of the country. A smaller map on the scale of four miles to the inch was published in 1881, corrected in 1890, and is at present (1905) under revision. An area of 1,084 square miles which included the more densely populated portions of the district was cadastrally surveyed in the seasons of 1898-94 to 1895-96. The maps are on the

scale of sixteen inches to the mile, and, in addition to the topographical features, show the boundaries of each field. The results obtained from the cadastral survey have been utilised in the revision of the one-inch map of the district.

STATEMENT D.
List of Markets—concluded.

Tahsil.	Place at which market is held.	Days of week when held.
SILCHAR— <i>concl'd.</i>	Sahapur	Sunday
	Saint Catherine	Monday
	Salchapra	Wednesday and Saturday
	Silchar town—	
	Khas bazar	Daily
	Ukil bazar	Sunday
	Sildubi	Wednesday
	Silkuri	Sunday
	Singarband	Saturday and Tuesday
	Sonai	Do. do.
	South Mohanpur	Monday
	Srikona II	Do.
	Tariniganj or Paylapal	Monday and Friday
	Telka	Tuesday
	Udharband	Monday and Friday
HAILAKANDI...	Ainakhal	Sunday.
	Baburbazar (Kalinagar)	Saturday and Wednesday
	Bandukmara garden	Sunday
	Chandipur garden	Do.
	Chupalghat (Bhatirkupa)... ..	Monday and Thursday
	Dhalai bazar	Wednesday
	" garden	Friday
	Hailakandi town	Saturday and Wednesday
	Hasiura garden	Sunday and Thursday
	Janaki bazar (North Kanchanpur)	Saturday and Wednesday
	Joykrishnapur	Monday and Friday
	Kalachara (Sudarsanpur)	Sunday and Thursday
	Kalibari bazar (Algapur)	Monday and Thursday
	Kaya garden	Sunday
	Kuchila garden	Tuesday and Friday
	Kukichara garden	Friday
	Lala bazar	Saturday and Tuesday
	Lalachara garden	Sunday and Thursday
	Lotakandi "	Thursday
	Manachara bazar	Do.
	Matijuri (Banadaha)	Tuesday and Friday
	Mohanpur bazar	Saturday
	" garden	Sunday
	Pakhichara garden	Do.
	Ralakandi (Itarkandi)	Friday
	Robertabad grant	Sunday
	Rupachara garden	Do.
	Saraspur garden	Friday
	Vernerpur garden	Saturday

TABLE I.
Average maximum and minimum temperatures registered at Silchar.

	January.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.	Year.

TOTAL OF YEAR ...	77·48	16·675	121·48	110·97

TABLE III.

Distribution of population by thanas.

Thana.	Popu- lation in 1901.	Popu- lation in 1891.	Difference.	Area in square miles.	Population per square mile.	Number of persons censused on tea gardens.
Silchar ...	162,094	1,40,461	+ 21,633	706.09	229	63,947
Lakhipur* ...	83,821	73,041	+ 10,780	266.91	314	27,408
Katigara ...	55,969	54,171	+ 1,798	674.76	82	10,365
Hailakandi ...	112,897	99,869	+ 13,028	414.00	272	27,843
North Cachar	40,812	18,941	+ 21,871	1,706.00	24	20,324†
TOTAL DISTRICT	455,593	386,483	+ 69,110	† 3,769	121	

* Udharband pargana, which in 1891 contained 7,124 persons, has since been transferred to the *Saár* Thana. The figures for 1891 for these two Thanass have been corrected accordingly.

† Railway population.

‡ The area of the district was furnished by the Survey Department and does not tally with the sum total of the areas of thanas, as the latter figures were obtained from the District Officer. The boundaries of the district were changed in 1904, and the present area is 3,565 square miles.

PREFACE.

THE Gazetteer of Sylhet is nothing more than a general description of the district as a whole, and does not, as Gazetteers generally do, include a directory. There are, however, hardly any places in the district which are worthy of the name of town, and the little villages in which the people live do not call for a separate and detailed description. Places which are centres of local trade or of some industry have been specified by name, but to attempt to describe each of these villages would merely have resulted in the most tedious iteration. It should be added that the Gazetteer was compiled at a time when Assam was still a separate Province, and that when the Province is mentioned it is to Assam and not to Eastern Bengal and Assam that reference is made. My acknowledgments are due to the Deputy Commissioner for his kindness in examining the work in proof.

B. C. ALLEN.

SHILLONG, *October*, 1905.

CONTENTS.

CHAPTER I.

PAGE.

Physical Aspects.

Area and boundaries—General aspects—Mountain system—River system—Swamps and marshes—Geology—Climate—Earthquakes—Fauna	... 1-20
---	----------

CHAPTER II.

History.

Early history—Gaur—Laur and Baniyachung—Koch invasions—The Jaintia Parganas—Sylhet under British rule—Khasi raids—Disputes on Cachar frontier—Riots at Sylhet—The Burmese war—Lushai raids—Floods—European settlers—The Cowry currency—Development of excise system—Early salaries—Public buildings—Sylhet in 1837—The mutiny year—Archæological remains	... 21-62
--	-----------

CHAPTER III.

The People.

Density—Towns and villages—Growth of population—Migration—Sex and marriage—Infirmities—Language—Caste—Brahmans—Sudras—Caste distribution—Muhammadanism—Mosques and tombs—Hinduism—The Shabaj Bhajan—Sacred places—Akhras—Christianity—Occupations—Leading families—Marriage customs—Hindu festivals—Amusements	 63-112

CHAPTER I.

PHYSICAL ASPECTS.

Area and Boundaries—General Aspects—Mountain System—River System—
Swamps and Marshes—Geology—Climate—Earthquakes—Fauna.

The district of Sylhet (vernacular *Srihatta*), which occupies the lower valley of the Barak or Surma river, lies between 23°59' and 25°13' N. and 90°56' and 93°36' E. and covers an area of 5,435 square miles. It is bounded on the north by the Khasi and Jaintia Hills, on the east by Cachar, on the south by the State of Hill Tippera, and on the west by the districts of Tippera and Mymensingh.

Boundaries and dimensions. The district is a broad and level valley bounded on either side by hills of considerable height. On the north there are none of the low outer ranges that generally break the descent of a mountain system to the plain ; the change is sharp and abrupt, and west of Therriaghat, the cliffs are like a Titanic sunk fence in some monstrous park, which drop 4,000 feet and more from the plateau above. Farther east the level falls, and the Jaintia Hills sink in an easy slope towards the plain. The mountains on the south belong to a different system, and run north and south instead of east and west ; they do not rise like an unbroken wall along the southern frontier, but thrust out eight spurs into the plain itself. On the eastern boundary one of these spurs stretches right up to the Barak, and the Surma Valley at this point is only some ten miles in breadth. The district is only a few feet above the level of the sea, is

intersected with numerous tortuous and sluggish rivers, and is dotted over with huge saucer-like depressions called *haors*, which are filled with water in the rainy season. Between June and September, a great part of Sunamganj, the north-westerly subdivision, goes under water. The banks of the rivers are the highest portions of the country and are lined with villages, but the rest of the subdivision is converted into a huge swamp covered with reeds and jungle grass. Here and there, there are islets of high ground which are always crowded with houses, but for a traveller passing through this country in the rainy season, it is difficult to realize that it supports a population of about 300 to the square mile. Further east the level rises, and the scenery is of a more normal type. Broad plains, covered with waving rice, are bounded on every side by what seems at a little distance to be dense and sombre forest. It is, however, only the jungle of bamboos, plantains, jack fruit, and mango trees, which completely conceal the houses of the cultivators; and a closer inspection shows that it is not one continuous belt of villages, but that the bamboo clumps are situated at varying intervals, and that it is only an optical delusion that makes them appear like an unbroken line. The scenery is monotonous, but in the summer time the wide expanse of green is restful to the eye, and near the hills the effect is very picturesque.

Round Sylhet town there are numerous low hills, covered with the freshest and most luxuriant turf; the bamboos which surround the villages are some of the most graceful of their kind, and the plain is bounded on the north by the bluest of blue hills. From Chhatak

*

the view is of a different character. Rivers and swamps extend on every side, but here and there are islets and ridges of high land, with lawns that slope to the water, dotted with shady trees that recall some garden washed by the waters of the Thames. To the south there are waving fields of rice, bounded with a long line of bamboos and palms ; on the north the hills rise like a mighty wall from the waste of waters and jungle at their feet. Their summits are often clothed in clouds, through which the rivers hurry to hurl themselves over precipices one or two thousand feet in height. The cliffs are here as sheer as though carved out by some cyclopean mason, and even in that humid atmosphere no tree or plant is able to obtain a foothold on the smooth unbroken surface. Below these mighty precipices are steep slopes clothed in dense tropical forest. In the central portion of the district, the scenery is more tame, but towards the south, the hills again appear, though the ranges that are situated within the boundaries of Sylhet are too low to add much to the beauty of the scene. At the eastern end, near Karimganj, dense groves of the graceful areca palm make a pleasant foreground to the blue mountains of North Cachar, and the low isolated hills, that project some two or three hundred feet above the alluvium, serve to break the level of the plain. The rivers with which the valley is intersected are dotted over with native craft, and, even in the winter time, the country on every side looks fresh and green.

In the central and southern portion of Sylhet there is little waste or uncultivated land, except in the hills, which in their
Jungle land.

natural state are covered with low scrub or bamboo jungle, and in the *haors*, which are lakes in the rainy season, and magnificent grazing grounds in the cold weather. In the north the Khasi and Jaintia Hills rise from swamps which recall the jungle that fringes the Brahmaputra, and there are wide stretches covered with reeds and elephant grass from ten to fifteen feet in height.

Roughly speaking, the district falls into the following divisions. To the north, there is the wall of hills along whose base the district boundary runs. At the foot of the hills there is a fosse or moat, a belt of country five or six miles wide, in places even more, which goes under water in the rains and is covered with high reed jungle, patches of which are cleared in the cold weather and sown with winter crops. This belt of flooded land is also found along the western border of Sylhet, though here, especially towards the south, it carries little jungle. In the south, the level gradually rises towards the Tippera Hills, and the spurs projecting northwards from this system afford a considerable area of high land suited to the growth of tea. The central portion of the district is a flat plain gradually rising in level towards the east, intersected with numerous sluggish rivers and water courses, and sinking here and there into great saucer-like depressions, which are being gradually filled by deposits of silt.

The Khasi and Jaintia Hills lie outside the borders of the district, and it is only at Chhatak, Barakia, and Panduah, and in the north-east corner of the Jaintia Parganas, between Jaintiapur

Mountain system.

and Mulagul, that the outlying ranges are represented by a few small hills that rise above the surface of the alluvium. A little to the north of Sylhet town there are numerous isolated hillocks, called *tilas*, from one to two hundred feet in height, and at Chiknagul, on the road between Sylhet and Jaintiapur, these hills take the form of ranges which cover an area of several square miles. A few more *tilas* are to be found between the Surma and the Kusiya, near Golapganj and Madhuganj, but the rest of the country north of the Kusiya and the Barak is a broad unbroken plain.

South of that river eight ranges of hills project from the Tippera system into the valley. On the extreme east is the Chhatachura range which starts from the Chhatachura peak, on the boundary of the Tippera and Lushai Hills, and forms the dividing line between the districts of Sylhet and Cachar. Chhatachura itself is 2,087 feet above the level of the sea, but the range gradually declines in height. The middle section, which bears the name of Saraspur, is only 1000 feet above sea level, while near the Barak at Badarpur it is only three or four hundred feet in height. On the western side of the Singla, or as it is more generally called, the Chargola valley, the Dohaliya or Pratapgarh hills stretch in a compact chain as far north as the Son *bil*. Beyond this point they break up into isolated *tilas*, which are continued right up to the Barak at Badarpur. The general height of the range is from four to five hundred feet, and the slopes are easy and gentle. The Pratapgarh range is separated from the Pathariya hills by the valley of the Langai. The Pathariyas are a tract of hilly country, from six to seven

miles in breadth, which runs almost due north as far as Latu. Several of the higher peaks are from six to seven hundred feet in height, but the level rises gradually from the plain, and the slopes are very easy. The Harargaz, or Langla hills might almost be classed as a continuation of the Pathariya range to the south-west. Near the frontier they attain an elevation in one peak of over 1,100 feet, but the general height of the outlying spurs is only about one-third of this.

The Bhanugach or Rajkandi hills are a small low range south of the Shamsbernagar railway station. Here they are stopped by the valley of the Manu, but reappear again on the further side, and under the name of the Ita hills, stretch nearly up to Fenchuganj. In height they range from 150 to 300 feet. The Balisira range lies between the Dholai on the east, the Manu on the north, and the road from Maulavi Bazar to Srimangal on the west. They rise gently from the plain to heights varying from 150 to 300 feet, and are rather a tract of elevated land than hills, in the sense in which that term is usually employed. The Satgaon and Raghunandan hills are two low ranges to the west. The railway runs along the foot of the Raghunandans from Itakhola to Shahji Bazar, and crosses the Satgaon hills near the station of that name. They contain no peaks of any height, and in general appearance resemble the Balisira range. In their natural state all of these hills are covered with tree forest, bamboo jungle, or low scrub. The soil and level were, however, found to be suitable for tea, and large areas have been cleared on the lower slopes and cultivated with that plant.

The principal river of the district is the Barak, which rises on the southern slopes of the Naga-Manipur watershed, flows through Manipur, Cachar, and Sylhet, and finally empties itself into the old bed of the Brahmaputra near Bhoirab Bazar, after a course, measured along its northern branch, of 560 miles. From Badarpur to a little beyond Haritika, a distance of some seven miles, it forms the boundary between Sylhet and Cachar. At this point it divides into two branches, the more northerly of which is called the Surma, and as far as Jelalpur flows in a north-westerly direction towards the Jaintia Hills, and continues to form the boundary between Cachar and Sylhet. Here it enters the latter district, and after receiving the waters of the Lobha, flows a south-westerly course to Golapganj. From this point the stream again takes a northerly direction past Sylhet town to Chhatak. From Chhatak to Sunamganj its course lies near the base of the Khasi Hills, but at the latter town it again turns sharply to the south. A little to the north of Dirai it turns westward and enters Mymensingh, and flows partly through that district, partly along the Sylhet frontier. Near Ajmiriganj it is joined by the Kalni, and at Madna by the Barak, and the combined stream which is here known as the Dhaleswari, finally falls into the old bed of the Brahmaputra.

The lower channel is known at first as the Kusiara, but after its confluence with the Manu it again divides into two branches. The northern arm is called the Bibiyana, and afterwards the Kalni, and rejoins the Surma on the borders of the district near Ajmiriganj. The

southern stream resumes the name of the original river, the Barak, and, after passing Nabiganj and Habiganj, falls into the Surma a little to the west of that place. The Surma in its course through the northern portion of the district receives the following rivers which bring to it the drainage of the hills—the Lobha, the Hari, which under the name of the Kusiya, joins it a little to the east of Sylhet, the Goyain Gong, or as it is called in the lower part of its course the Chengar khal, the Bogapani, and the Jadukata. The rainfall in this portion of the district is extremely heavy, and is only exceeded by the phenomenal precipitation on the southern face of the Khasi and Jaintia Hills, the whole of which drains down into the valley. The plain is less than 50 feet above sea level, and the natural consequence is that the rivers are unable to carry off the enormous volume of water precipitated on their catchment areas. The whole of the district north of the Surma is a network of streams and channels which connect the principal rivers with one another, and during the rainy season the lower parts of the country go under water.

The principal tributaries of the Kusiara are the Singla, the Langai, the Manu, the Gopla, and the Khowai. The Singla rises in the Lushai Hills, and flows between the Chhatachura and Pratapgarh ranges northwards to the Son *bil*. On emerging from this *bil* it is known as the Kachua, and falls into the Kusiara a little to the east of Karimganj town. For the first eight miles of its course through the district, it flows through jungle land which is very sparsely peopled; but from

**The Southern
Rivers—The Singla.**

that point to its junction with the Kusiara its banks are fringed with villages and tea gardens.

The Langai also rises in the mountainous country beyond the southern frontier, and
The Langai. . flows a northerly course between the Pratapgarh and Pathariya hills to within a few miles of Karimganj town. Here it turns to the south-west and finally disappears in the Hakaluki *haor*, but during the rainy season it is connected with the Kusiara by a channel known as the Natia khal.

The Manu rises in Hill Tippera, and flows a
The Manu. tortuous north-westerly course between the Rajkandi and Ita hills, and along the northern face of the Balisira range past Maulavi Bazar, till it falls into the Kusiara a little to the east of Bahadurpur. Its principal tributary is the Dholai, which collects the drainage from the Balisira and Rajkandi hills. The Gopla drains the low country between the Balisira and Satgaon hills, and the Khowai rises in Hill Tippera and falls into the Barak at Habiganj. Throughout the whole of its course its banks are lined with villages, and some of them, like Muchikandi and Laskarpur, are of considerable importance.

The country between the Surma and the Kusiara or Barak exhibits much the same phenomena as are to be found in the northern section of the district. The rainfall is extremely heavy, the level falls but slightly towards the west, and the line of drainage is not clear and well defined. There is a whole network

of smaller streams, many of which flow from north to south, and rise from or disappear in *haors*, or swamps. South of the Barak, the level falls more steeply from the hills and the general trend of the drainage is towards that river.

The rivers possess the characteristics usually to be found in a flat alluvial country.

General characteristics of rivers. The current is sluggish, the course is tortuous, and the bottom muddy.

In the rains the waters are surcharged with matter washed from the surrounding hills, and in times of flood a large portion of this silt is deposited in the immediate neighbourhood of the stream. The result is that the banks of the rivers tend to become higher than the country at the back, and they are in consequence generally lined with villages. The extent to which these rivers are used for navigation is referred to in the section dealing with communications.

The two salient facts about the drainage system of Sylhet are the enormous quantity of rain water which is precipitated upon the district itself, or drains into it from the surrounding hills, and the absence of a sufficiently steep gradient to carry this huge rainfall off. As a natural consequence water tends to collect in the rainy season in every hollow, and the larger depressions, which are known as *haors*, are a distinctive feature in the district scenery. From June to September they are considerable lakes, but when the rains end the water gradually drains off, and during the

Swamps and marshes.

dry season is only to be found in the lowest parts of the *haor*. The remainder is covered with reeds and grass and is sometimes sown with winter crops. The level of these swamps is being gradually raised by the silt that is every year poured into them, and the submerged area is being gradually reduced. Statement A appended to this chapter shows what an enormous number of these swamps there are, and how they are distributed over every portion of the district, while Statement B contains the names of the most important *haors*.

The plain is of alluvial origin and is composed of clay and sand in varying proportions.

Geology.

The low isolated hills, which here and there project above the level of the alluvium, are formed of layers of sand and gravel, which are often highly indurated with a ferruginous cement. The hills to the south are composed of upper tertiary rocks, in which sand stone largely predominates. Although Sylhet lime is well known in the Calcutta market, and though an enormous quantity is every year exported from the district, the only lime quarry within the boundaries of Sylhet is the one at Jaflong, and even this is not worked at the present day. Deposits of coal exist near Pathariya in the Langai valley, but no attempt has yet been made to work them.

The climate of Sylhet is warmer and not less humid than that of the Assam Valley, but
Rainfall and temperature. between the middle of November and the middle of February is fairly cool and pleasant. In

March the temperature begins to rise, but heavy rain in April and May prevents the development of the fierce hot weather that is such a trial to the residents in the plains of Upper India at this season of the year. Table I in the appendix shows the average monthly rainfall at certain selected stations in the district. November to February are the four dry months, the average rainfall at Sylhet during that period being only 3.24 inches. During April and May, when precipitation in Northern India is at a minimum, some 35 inches fall at the sadr station, and in the four succeeding months the rainfall is even heavier. There is a marked difference between the rainfall in the northern and southern portions of the district. In Sunamganj it is about 210 inches in the year, at Sylhet 157, and at Karimganj 160. At Maulavi Bazar, on the other hand, it is only 104 inches and at Habiganj ten inches less.

Storms generally come from the south-west, and are usually welcomed as they relieve the oppressiveness of the atmosphere, but are seldom sufficiently violent to do serious damage. Flood is the normal condition of the northern and western portions of the district during the rainy season, but the people have learned to adapt themselves to the peculiar conditions of the country, and do not as a rule suffer any special inconvenience. In the following chapter reference is made to the floods which are said to have been the cause of terrible desolation and misery at the end of the 18th century, but no such calamities have occurred of recent years. In 1853, there was a high flood, and the annual inundation was more pronounced than usual in

the west of the district in August 1893, September 1897, and July 1903, but no very serious damage was done.

Sylhet, like the rest of Assam, is a seismic area, and earthquakes are referred to in some of the earliest correspondence in the office of the Deputy Commissioner, though they do not seem to have been the cause of any serious damage. The shock of 1869 was an exception. This earthquake was felt over an area of 250,000 square miles, from Upper Burma to Patna and Hazaribagh, and is supposed to have originated in a fissure about 20 miles long, situated at a considerable depth below the surface on the northern border of the Jaintia Hills. In Sylhet, the steeple of the church was shattered, the walls of the Court-house and the Circuit bungalow were cracked, and in the eastern part of the district the banks of many of the rivers caved in. There was no loss of life, and the damage done was inconsiderable in comparison with the havoc wrought by the great earthquake of June 12th, 1897.

This earthquake was felt over an area of 1,750,000 square miles, from Rangoon in the south-east to Kangra in the north-west, from the Himalayas to Masulipatam, and serious damage was done to masonry buildings over an area of 145,000 square miles.* The area of maximum disturbance was a tract of country of the shape of a cocked hat, whose base line ran from Rangpur to Jaintiapur, while the top of the crown was near Barpeta. The first shock occurred at Sylhet about 4-50 P.M. and was not preceded

* Memoirs of Geological Survey of India, Vol. XXIX, p. 52.

by any special atmospheric conditions, though the inhabitants of a village at the foot of the hills north of Sunamganj stated that, for some days previously, they had heard continual explosions, which seemed to be taking place in the north-east, *i.e.*, in the direction of Shillong. Nearly all the masonry buildings in Sylhet town were levelled with the ground. A new cutchery that was in course of construction at Sunamganj was thrown down, and the old cutcherry and the residence of the Subdivisional Officer only escaped because they were made of reeds, plaister, and timber instead of masonry. The residence of the Subdivisional Officer at Habiganj was also wrecked. In Maulavi Bazar and Karimganj no damage was done to public buildings, and very little injury was done even to the masonry buildings on tea gardens in the south of the district. The banks of the rivers, especially in the north, caved in and many people were drowned.

The list of casualties as finally reported was 545,
distributed as follows: Sylhet town
Casualties. 55, North Sylhet (rural area) 178,
Sunamganj 287, Habiganj 7, South Sylhet 8, Karimganj
10. These figures clearly show the enormous difference
between the violence of the shock as experienced in the
north and south of the district. In Sylhet town most
of the casualties were due to the collapse of masonry
buildings. The prisoners in the jail had a most fortunate
escape. At the time when the earthquake occurred they
were paraded in the yard preparatory to being locked up
for the night, and had the shock come half an hour later,
hundreds would in all probability have been killed.
Most of the deaths in the mofussil were due to drowning,

the unfortunate people being precipitated from the falling banks into the river, or swamped in the boats in which they were travelling at the time. One hundred and seventy-nine of the deaths in the Sunamganj subdivision were said to be due to drowning, 87 to the collapse of buildings, and 13 to the people having fallen into fissures in the earth. The Deputy Commissioner reported that there were several apparently authenticated instances of persons having been swallowed up like Korah, Dathan, and Abiram. In one case in Habiganj an old woman was sitting in an *akhra*,* when the ground opened exactly beneath her and she disappeared. In another case in Sunamganj, a man and his wife were standing on the bank of a river, when a fissure suddenly opened near the woman, into which she fell. The husband caught her by the hair to save her, but finding his own position insecure let go his hold. The woman sank into the crevasse, and her body was not recovered.

The village of Jugirgaon, opposite Sunamganj, subsided into the river, and there were 39 casualties in this place alone. Joy-nagar Bazar suffered a like fate, and here too 29 deaths occurred. Sunamganj itself escaped, but most of the people, traders and pleaders, high and low, were so alarmed that they left on the morning of the 13th, or took up their residence in boats. Out of some 90 masonry buildings in the subdivision, only five or six were left standing, and nearly 6,000 reed and walled houses are said to have been destroyed. Most of these huts were,

* A kind of Vaishnavite monastery to which, however, women are admitted.

however, old and unsound, and would not in any case have lasted very much longer, so that under this head the material loss to the people was not large. Comparatively little damage was done to the district roads with the exception of the road from Sunamganj to Pagla, and from Salutikar to Companyganj. No less than six fine bridges on the latter road were ruined, and the light railway running from Companyganj to Therriaghat was wrecked. Considerable damage was also done to the Assam-Bengal Railway in the south of the district, as the banks had been but recently constructed and had not had time to be properly consolidated.

Elephants are sometimes found in the hilly country on the southern frontier of the district, but are far from common. The two horned rhinoceros is also said to have been seen in that locality, but is extremely rare. Tigers are not very common, though they are found both in the north and south of the district; leopards are not so scarce. Wild buffalo are occasionally found in the swamps at the foot of the Khasi Hills, and wild pig, sambar (*cervus unicolor*), hog deer (*cervus porcinus*), and swamp deer (*cervus duvauceli*) can be shot in the same locality. Small game include various kinds of duck and teal, snipe, jungle fowl, and marsh partridge. In 1903 only three persons were killed by wild animals, *i.e.*, one by a tiger and two by wild pigs, but snakes were responsible for 75 deaths. Rewards were paid in that year for the destruction of 11 tigers and 10 leopards.

CHAPTER II.

HISTORY.

Early history—Gaur—Lam and Baniyachanng—Koch invasions—The Jaintia Parganas—Sylhet under British rule—Khasi raids—Disputes on Cachar frontier—Riots at Sylhet—The Burmese war—Lushai raids—Floods—European settlers—The cowry currency—Development of excise system—Early salaries—Public buildings—Sylhet in 1837—The mutiny year—Archæological remains.

Little is known of the history of Sylhet, but, like other countries in the early stages of civilization, it seems to have been split up into a number of petty chiefships. These were administered by little princelings, who enjoyed a certain degree of independence, though dominated at first by the Tippera State, and afterwards by the Muhammadans. The present Raja of Hill Tippera traces his family back to Drujho, one of the lunar race of kings, whose descendant Dwitya is said to have fled after the battle of Kurukshetra to the jungles of Hill Tippera.* It is possible that the ancestors of the Raja originally came, as is alleged, from Central India ; but there seems to be little doubt that the Tipperas are closely allied with the Bodo or Kacharis, and it is generally thought that a considerable portion of the present inhabitants of Sylhet were originally descended from that stock. With regard to the claim made by the royal family to more exalted lineage, it should be borne in mind that more than one matrimonial alliance has been made

* *Vide* report submitted to the Bengal Government by the Political Agent to Hill Tippera in 1875.

with the reigning houses of Cachar and Manipur, a fact which is not without its own significance.

A thousand years ago the Karimganj subdivision seems to have been included in the Tippera kingdom. In 640 A.D. the Raja wished to perform a sacrifice on an unusually imposing scale, and obtained five Brahmans from the Itwah village in Kanouj to preside over the ceremonies. Subsequently, with the object of retaining the holy men in this outlandish corner of the world, he gave them a grant of land which is said to have been situated in the Panchakhanda pargana in the Karimganj subdivision. This land was bounded on the north and west by the Kusiya river, and on the south and east by the villages of Hankala Kukis, a tribe from which the Hakaluki *haor* is said to take its name.* Various tanks and old ruins in the South Sylhet subdivision are ascribed to the descendents of these colonists. In 1195 A.D. a Brahman named Nidhipati, who was descended from one of the five original immigrants from Kanouj, received a grant of land in what is now known as the Ita pargana, from the Tippera king. From this family sprung Bhanu Narayan, who was given the title of Raja as a reward for services rendered in the capture of a rebel. Tradition has it that his house was located on the site now occupied by the Rajnagar thana, and the large tank in the immediate vicinity is said to have been excavated by his orders. His eldest son, named Subid Narayan, built a fort on the

* A note prepared by Babu D. N. Chaudhuri is the authority for this statement and of the account given of Raja Subid Narayan. The copper plate, which is the authority for the grant, is said to be still in existence in Hill Tippera.

Barua hills to the east of the Ita pargana, the ruins of which are to be seen at the present day. A tank called Balda sagar was excavated at the instance of his daughter, but he is best known by the Sagar dighi, a large tank which he had dug, and on the banks of which he proposed to build his house. He was, however, suddenly attacked by a Pathan from Murshidabad named Khowaj Osman, and in disgust committed suicide while worshipping in the family temple. A few years later Khowaj Osman, the ruins of whose fort is still to be seen in the Ita hills in the Srisurjya mauza, rose in revolt with other zamindars, and seized parganas Ita, Taraf, and Sylhet, but was subdued by Lodi Khan, grandson of Surwar Khan.

Gaur, or North Sylhet, was originally ruled by a line of Hindu kings. Nothing is known either of their dynasty or fortunes, and they were probably petty local princes with less power and influence than that enjoyed by a big zamindar of Bengal at the present day. The downfall of the last Raja, Gaur Gobind, is said to have been due to his severity towards a follower of the Prophet. This man had sacrificed a cow to celebrate the birth of a son. As the animal was being dismembered a kite swooped down, caught up a piece of flesh, and dropped it in the house of a holy Brahman. On the matter being reported to the king, he ordered the unfortunate infant to be killed and cut off the father's hand. The man applied to his co-religionists for help, and an army was despatched under Sikandar Shah, but met with no success. A second force was then sent under Sayed Nasir Dey, which was

**Gaur or North
Sylhet.**

accompanied by the famous fakir Shah Jalal. This man had been born in Yemen in Arabia, and had been sent by his uncle to Hindustan. He had been given a sample of earth and had been ordered to settle wherever he might find earth of the same character as the sample he took with him. Shah Jalal crossed the Brahmaputra and the Surma on a *mocholla* or praying seat, and proceeded to reduce Gaur Gobind by methods which no ordinary man could be expected to resist. The Hindu Raja had built himself a magical seven-storied tower, to which he retreated on the approach of the invaders. Shah Jalal each day offered up a solemn prayer, at the conclusion of which one of the stories of the tower collapsed. Gaur Gobind endured this mysterious destruction of his fortress for four days and then surrendered, and Shah Jalal, who, in the course of his prayers, had discovered that the earth of Sylhet resembled that of his uncle's sample, determined to take up his permanent abode in the newly conquered town. The administration of the country was made over to Sikandar Shah, and a mosque was erected for the great fakir who was really responsible for the victory. The mosque in which his bones now rest is regarded as a place of the greatest sanctity, and the tombs of his 360 disciples are still to be seen in almost every part of the town.* The defeat of Gaur Gobind took place in 1384 A. D., and from that time onward this portion of the district was ruled by the Muhammadans.

* The authorities on the subject of Shah Jalal are a note by Dr. Wise in J. A. S. B., Vol. 42, Pt. I., and an account of Sylhet written in 1874 by Sumbhoo Chunder Dey Munsif. Dr. Bloch is of opinion that the narrative of Shah Jalal's life is so thickly overgrown with fiction that it remains a matter of doubt whether he is a historical person at all. It is said that he died in 1195 A. D., and if this date is correct he obviously could have had nothing to do with the conquest of Sylhet.

At the time of the conquest of Sylhet by the Muhammadans, Laur, which is situated in the north-west corner of the district, was ruled by a line of Hindu princes.* This family traced its origin to a Brahman named Keshab Misra, who had left Kanouj to seek his fortunes in the east. One of his descendants, named Ramnath, had three sons, the eldest of whom remained at Laur, while the second had a palace built for him at Jagannathpur, and the youngest was established at Baniyachung. The eldest son had no descendants, and Durbar Khan, the head of the Jagannathpur branch, seized the whole of Laur, much to the disgust of Gobind Singh who was ruling at Baniyachung. On Durbar Khan's death, Gobind Singh endeavoured to obtain his share of Laur, but Durbar Khan's sons appealed to the Nawab of Murshidabad, who arrested Gobind Singh and carried him off to Murshidabad. There he was converted to the faith of Islam, and as a reward was given possession of the estates at Laur, though as a feudatory and no longer as an independent princeling. In 1744 A.D. Laur was burned by the Khasis, and many of the people moved to Baniyachung, where Abed Reza, the son of Gobind Singh, had already made his home. It was about this time that a tribute of 48 long boats was imposed on Baniyachung, and subsequently three-fourths of the estates were assessed to revenue. Abed Reza built a large fort in Laur, the ruins of which are to be seen at the present day, and his son Umed excavated a deep moat round Baniyachung. The descendants of this noble house are

* Most of the information embodied in the following paragraph is merely traditional, and has been supplied to me by Babu Padmanath Bhattacharya Bidyabinod, M.A.

still living in that village, but have lost their wealth and influence and are in very reduced circumstances.

Another version of the origin of Baniyachung is that a merchant, who was travelling with a crew of Chung or Namasudra boatmen, anchored in the *haor* over the site on which the village was subsequently built. An image of the goddess Kali was in the boat. During the night the merchant dreamed that the goddess declined to leave the place, and informed him that, if he would only settle there a Brahman would become the ruler of the town. The waters gradually disappeared, as they do at the present day on the cessation of the rains, and a village was founded by the pious merchant. The first Raja was a Brahman named Keshab Misra. One of his descendants, Gobind, quarrelled with the governor of Sylhet, and was summoned to Delhi where he embraced the moslem faith. The story of the Baniya and his Chungs would seem, however, to belong to the category of myths.

In the latter part of the sixteenth century Silarai, the brother of the great Koch king
Koch invasions. Nar Narayan, is said to have defeated the Raja of Sylhet. The territories of this prince were near those of the Jaintia Raja, and he is described as being a very powerful monarch. As has been already pointed out, Sylhet proper had been conquered by the Muhammadans two centuries before, but it is possible that the chronicler may be referring to the king of Laur, or to some quasi-independent Raja south of the

Kusiyara.* The battle lasted for three days, and was finally decided by a furious charge, headed by Silarai in person, in which the king himself and an immense number of his followers went down. His brother Asirai abandoned the unequal contest, and returned with Silarai to the court of Nar Narayan. The Koch prince restored to him his brother's kingdom, but imposed a tribute of 100 elephants, 200 horses, Rs. 3,00,000 and 10,000 gold coins, an assessment which must obviously have been a polite invention of the chronicler.†

The account given of 'Sircar Sylhet' in the *Ain Akbari* is very brief, and is largely taken up with the description of two birds, a fact which suggests that the author of this, the earliest of Indian gazetteers, knew but little of his subject, or he would hardly have had recourse to such uninteresting padding. Sylhet is said to be "very mountainous,"—save the mark—and to furnish many eunuchs for the seraglios. The products mentioned are soontara, "a delicious fruit in colour like an orange but of an oblong form," China root, and lignum aloes, and the military strength is put down at 1,100 cavalry, 190 elephants, and 42,920 infantry.

The Jaintia Parganas are situated in the north-east corner of the district, and stretch from Therriaghat to the Cachar frontier

* The Muhammadans do not seem to have had a very firm grip upon their conquest and the Tipperas are said to have overrun Sylhet for a short time in the sixteenth century.

† The Koch King's of Kamarupa by E. A. Gait, Shillong, 1895, page 27.

along the base of the Jaintia Hills.* To the south they are roughly bounded by the Surma river—roughly, for pargana Satbank lies on the left side of that river, while between Golapganj and Sylhet there is a block of permanently settled land, which does not form part of Jaintia, extending as far north as Salutikar.

The territory of the Jaintia Rajas included, in addition to this portion of Sylhet, the hills inhabited by the Syntengs, and from time to time they succeeded in exercising some control over the country lying between the Jaintia Hills and the Kalang in the Assam Valley. How the Syntengs came to be united under a single ruler, while their neighbours and kinsmen on the west remained split up into a number of petty principalities, we do not know. History is equally silent with regard to the manner in which the Jaintia Rajas became the rulers and absolute owners of a tract of land in the plains of Sylhet, which at the present day is largely inhabited by Muhammadans. The royal family were of Synteng origin, and, though they had for many years been under the influence of Hinduism, they still retained the curious Khasi custom of inheritance through the female. This custom ultimately brought about their downfall, as it was the desire of the Raja's sister for a son that led to the kidnapping and sacrifice of British subjects.

* These fragments of Jaintia history prior to 1774 A. D. are taken from the Ahom Buranjia and a paper by Mr. E. A. Gait published in the Journal of the Asiatic Society of Bengal, Vol. LXIV, Part I, No. 3, page 242.

The following is a list of the Jaintia Rajas as recorded by tradition. Against the names of four of them have been inserted the dates at which from the evidence of coins, inscriptions, and the Ahom chronicles it appears that they were living :—

- | | |
|----------------------------|-----------------------------------|
| 1. Parbat Ray. | 13. Pratapa-Singh. |
| 2. Majha Gosain. | 14. Lakshmi-Narayana (1710 A. D.) |

| 11. Jasamanta Ray. | annexation in 1835 A. D. |
| 12. Vana-Singh. | |

In the latter part of the sixteenth century, the Jaintia Raja, like the king of Sylhet, was reduced to a state of vassalage by the Koch king Nar Narayan. But the decline of the Koches was as rapid as their rise, and the Jaintia king must soon have succeeded in throwing off their yoke. According to tradition, the Raja was forbidden to mint coins in his own name ; and this perhaps is why so few have been found which bear the name of the king in whose reign they were struck. The Jaintia coinage was made of unusually base metal, and two rupees which were assayed in 1836 were valued at 3 annas and 4 annas 9 pie respectively.

Dhan Manik is said to have been at war with the Kacharis at the beginning of the seventeenth century, and, in order to enlist

Conquest of Jaintia by Ahoms in 17th century.

the Ahoms on his side, offered to give his daughter to their Raja, Pratap Singh, if he would send to fetch her through the Kachari country. The ruse was successful, the Ahoms became involved in war with the Kacharis, and the Jaintia Raja was delivered from his enemies. His successor Jasa Manik, so the story goes, went to Kuch Bihar where he married a Koch princess. With her dowry he received the image of Jainteswari, or Kali, which subsequently attained so evil a notoriety on account of the human sacrifices offered to it, sacrifices which ultimately led to the downfall of the Raja. At the beginning of the eighteenth century Ram Singh, the Raja of that time, kidnapped the Raja of Cachar, who had retired through the hills before the armies of the greatest of the Ahom kings, Rudra Singh. The Kachari prince applied to his former enemy for help, armies were despatched through the North Cachar and Jaintia Hills, the two princes were arrested and taken to the Assam Valley, and Jaintia was annexed to the Ahom territories. The Raja himself has no claim upon our sympathies, as he seems to have been entirely responsible for his own discomfiture. But, then as ever, it was a case of *quidquid delirant reges plectuntur Achivi*, and the fate of his wretched subjects was truly lamentable. Jaintiapur was plundered and burnt, about a thousand persons were tortured to death, and even the women were not spared but were deprived of their ears and noses.* Rudra Singh formally notified the Muhammadan fauzdar of Sylhet that Jaintia had passed into his possession, and the two Governments prepared to exchange lists of the

* An Ahom chronicle is the authority for this statement.

products of their respective countries, with the object of facilitating trade. But though their monarch had submitted, the hardy mountainers, over whom his rule was ever of the lightest, declined to accept an alien yoke. They rose as one man, butchered the Ahom garrisons in the hills, and resumed their former free and easy life. The Jaintia Raja died in captivity, but his heir was established on the throne, and the Ahoms made no further attempt to exercise an effective jurisdiction over the territory entrusted to him. Communications were, however, maintained between the two valleys, and in 1757, envoys from Jaintia are said to have been received by the Ahom king in the portico of the Hajo temple, and to have complained that the Sonapur duar had been closed by the Khairam Raja. The king ordered it to be opened as trade between the valley and the hills was doubtless highly advantageous to both parties.

The first occasion on which the Jaintia Parganas were entered by the British was in 1774 A.D. when Major Henniker led a force against the Raja. The causes which provoked this expedition are not on record, but some years afterwards the Collector comments on the excellent effect produced, and on the correct attitude of the Jaintia people towards our frontier as compared with the insolent violence of the Khasis.

In 1821, some emissaries from this State were detected in the act of kidnapping British subjects, with the object of sacrificing them at the shrine of Kali. One of the culprits admitted that human sacrifices had been

annually offered for at least ten years, in the hope that the sister of the Raja might, through the intercessions of the goddess Kali, be blessed with offspring. The princess was always present on the occasion of each sacrifice, and bathed her person in the blood of the victim, whose throat was cut by the officiating priest.* Suitable punishment was meted out, and a solemn warning was given to the Raja that any repetition of this offence would be followed by the confiscation of his territories. In 1824, he entered into an agreement with Mr. David Scott by which he acknowledged himself to be dependant on the British Government, and pledged himself to abstain from entering into any negotiation with a foreign power. Three years later, a second attempt was made upon the liberties of British subjects, and in 1832, a similar attempt was at last crowned with success. Three out of the four men seized were sacrificed to Kali; the fourth escaped and reported the outrage to the authorities. The Raja was called upon to deliver up the culprits, and, as he declined to do so, his territories in the plains were annexed in 1835.

The rest of Sylhet passed into the hands of the East India Company in 1765. The first
Sylhet under British rule. resident to be appointed was Mr. Thackeray, the grandfather of the famous novelist, who built a large house near the site on which the bungalow of the Deputy Commissioner now stands. He was succeeded by Mr. Holland, who made a regular settlement of the district; and in 1779 came Mr. Robert Lindsay, who acted as Collector for upwards of ten years, and of

* Asiatic Journal, Vol. XIII, p. 177.

whose administration there is an interesting account in the Lives of the Lindsays. A British district has obviously no history which can be reproduced in a condensed form in chronological tables. Many years are barren of incident, the crops are sown and reaped, the traders come and go, one generation gradually melts into another and there is nothing for the chronicler to report. The laws which govern the actions of the people are passed elsewhere, the orders by which the Collector of Sylhet is guided are issued at Dacca and Calcutta, the district is part of a corporate whole and is no longer a separate entity, to work out its ruin or salvation for itself. At the same time, interesting letters can be found which enable us to trace the gradual development of the administration, and in the following pages reference is made to such arrangements or events as seem of interest. No allusion has been made to the land revenue history, as this extremely complicated subject is dealt with in the chapter on land revenue.

Under Mughal, and for some time under British rule, Sylhet was a frontier district, and
Frontier troubles.
The Khasis. was exposed to all the inconveniences that such a position usually entails. The Khasis were a continual source of trouble to the Muhammadans, and it was not long before they came into collision with the British. Difficulties seem to have first arisen in 1779. A letter from the Collector in that year refers to the value of the trade between Calcutta and Panduah, a village situated near Bholaganj, which a hundred years ago occupied the position which is enjoyed by Chhatak at the

present day. The Khasis seem to have been encouraged to adopt an offensive attitude by the conduct of some 'low Europeans,' who had treated them with undue deference ; and Mr. Lindsay was compelled to ask for sanction to the construction of a small fort, surrounded by a brick wall, which would afford protection to the merchants. The first serious outbreak, after Sylhet came under British rule, occurred in 1783, when the Khasis demanded the head of a havildar, whom they charged with having treated them with contumely. This calm request was naturally refused, whereupon they attacked the thana, and there was "considerable loss on both sides." Mr. Lindsay's own lime works did not escape, and his servants, so he says, were cut to pieces. Four years later the Khasis of Laur joined forces with the people inhabiting the submontane tracts ; ravaged the parganas of Atgram, Selharas, Bangsikunda, Ramdiga and Betal, and put to death upwards of 300 people.* Troops were despatched without delay to the foot of the hills, but they found that the raiders had already retreated to their mountain strongholds.

A few months later Mr. Lindsay left Sylhet, and the office of Collector was assumed by Mr. **The Khasis and Mr. Willes.** John Willes, a gentleman who does not seem to have been endowed by nature with the character and temper that are best adapted for the administration of a turbulent and frontier district. At the end of 1788 a Khasi freebooter, named Ganga Singh, plundered the bazar and thana at Ishamati, and put to death one Bara Chaudri with his family. A native officer was then

* Collector's letter No. 84, dated 26th October 1787.

deputed to enquire into the condition of the submontane tracts, and he reported that the people had been reduced by the Khasis to a state of abject misery and were living on grass and fish.* Panduah was garrisoned by a force of sepoy, but in June 1789, the Khasis made a bold attack upon the place, and killed several of the rank and file. Two European merchants who were staying in the village escaped with difficulty, and the thanadar was at first reported to be killed. Mr. Willes at once addressed the Government at Calcutta, but seems to have been reluctant to take any action on his own responsibility. A force was sent to relieve Panduah which achieved its object, to the great satisfaction of the Collector, "without bloodshed," and in all his dealings with these savages he unfortunately displayed a mildness of character which only confirmed them in their lawless inclinations. His temper can be judged from a letter to Lieutenant Cheape, who was in command of the sepoy on the frontier, in which the following sentences occur: "I must conclude in entreating you in the strongest terms to shew in future all possible lenity to such persons as may be so unfortunate as to be wounded. . . . I further entreat you that in no instance the sepoy be allowed to fire on any person except when in the direct act of opposition."

The Collector admitted to the Supreme Government that he had no authority on the northern frontier of his district, and that, if he were to summon the Khasi sirdar of any of the 137 villages cultivated by the Sylhet raiyats, "he would refuse to obey, threaten, and probably cut off

* Collector's letter No. 123, dated 19th February 1789.

the head of the messenger, and then call down his relations from the hills to revenge what he would consider an insult." But while making these admissions, he does not seem to have been fully sensible of the desirability of making some attempt, at any rate, to assert the Company's authority. Some of his observations on the policy to be adopted were just enough. He pointed out that, since Major Henniker's expedition into Jaintia in 1774, the people of that country had abstained from raids into Sylhet, that submission and conciliatory measures had merely incited the savages to further violence, and that the Khasis must be taught that they were attacking the Company, and not the fauzdar of Sylhet, with whom in the times of the Mughals they seem to have carried on an intermittent warfare. He was, however, better in council than in action, and he does not seem to have made any attempt to personally suppress the disorders in his district. "Punishment," he wrote to Lord Cornwallis, "can hereafter be given, but that should not be attempted rashly by a Collector, whose passions may be engaged, whose motive may be suspected, and whose character may be implicated." He concluded by requesting that the Governor-General would act on his own discretion, as he, the Collector, was not well acquainted with the condition of the Khasis. Troops were, however, despatched to Panduah who quieted the hillmen for a time, but in 1795, the Khasis again raided on the plains.

In 1799, the Collector reported that the district had been freed from the vexatious inroads of the hillmen, and proposed that the submontane parganas should be measured up, as this

Ultimate pacifica-
tion.

work had been left undone by Mr. Willes owing to the unsettled condition of the frontier. The Khasis seem at this time to have given little trouble, and in 1825 a medical man was deputed to report on Cherra Punji ; but two years later a sepoy, a *dákwallah*, and a *dhobi* were murdered by the hillmen in the neighbourhood of Panduah. The Collector of that time was not the man to tolerate such outrages, and in the absence of the Agent to the Governor-General, he took upon himself to request the officer commanding the Sylhet Light Infantry to retaliate on the parties concerned, and, if they were in open arms against the Honb'le Company, to take such steps as might be necessary for their restraint. The steps taken seem to have been sufficient, but in 1831, two years after the massacre at Nongkhlaio, a raid was made upon the village of Kanta Kal. The raiders were dispersed by the Sylhet Light Infantry under Captain Lister, and since that date the Khasis have ceased to be a source of anxiety or embarrassment to the Administration.

Trouble was, however, experienced on the eastern as well as on the northern frontier. In 1799, a Mughal, named Aga Muhammad Reza, entered Cachar from Sylhet, and for a time seems to have succeeded in making himself master of that country. He seduced the Naga Kukis from their allegiance, cut up some *borkandazes* sent against him by the Raja, and compelled that prince to take refuge in the hills. He then assumed the character and attributes of a prophet, styled himself Immaum Mehadri, and sent 1,200 of his followers to attack the Company's thana at Bon-dassye. This thana was garrisoned by one havildar and

Disputes on Cachar
frontier.

eight sepoys. The Kacharis are said to have attacked this small force with 300 men and two three-pounder guns, but they were repulsed with some loss, after a smart engagement. The attack was renewed under the personal direction of the prophet, but in the meanwhile the thana garrison had been reinforced by 70 sepoys, and the Kacharis were driven back, with a loss of 90 men and 5 small pieces of cannon. Their leader made his escape, but was subsequently arrested, and peace and tranquillity were soon restored. So strong, however, had been his influence that many Hindus in the eastern portion of Sylhet are said to have abjured their faith and turned Muhamadan.

A few years later disputes arose with regard to the boundary between Sylhet and Cachar. In 1807, a line was laid down by an *amin*, but very shortly after the completion of the work, the Raja's people trespassed upon the estate of one Mooluck Chund, filled up the ditches which had been dug along the boundary, and carried off the crops. An *amin* was again deputed to lay down the line, but, as soon as the crops ripened for the following harvest, the Raja's people again appeared upon the scene. Raids were also made on pargana Chapghat, and the crops were forcibly cut and carried off. Stringent orders were accordingly issued to the native officer at the Badarpur thana to 'prevent these savage intruders from committing such ravages'; but subsequently it was found that Mooluck Chund's title to the land was very doubtful, and it appeared that the line laid down by the *amin* included a portion of the Raja's territory.

**Disputes with Raja
of Cachar.**

Trouble, however, was experienced from within as well as on the frontier. The natives of the district were turbulent and unruly, and, as is not unfrequently the case in frontier tracts, had little respect for the majesty of the law. In 1779, a havildar and ten sepoys were despatched to put an auction purchaser in possession of his newly acquired estates in Balisira. The former proprietor resisted the officers of the law by force, killed two and wounded several others, and effectually prevented them from carrying out their orders. Not content with this, he proceeded to plunder two boats loaded with upwards of two thousand rupees worth of cowries, the property of Government. A stronger force was then sent from Sylhet which succeeded in giving the auction purchaser possession, and the former owner fled. But he fled only to return again with a large body of men, who surprised and fired the cutcherry, cut down the sepoys who offered them resistance, and made the others prisoner. The outlaw was, however, compelled again to fly, and was subsequently arrested by the authorities at Dacca.

Three years later there was a serious outbreak during the *Maharram* at Sylhet, of which the following account was given by Mr. Lindsay :—*

**Riots at Sylhet
in 1782.**

“At this last place (Sylhet) the Musalmans had become uncommonly violent. The period of the *Maharram*, or annual festival of the Islam faith, was approaching, when a deputation from the Hindu inhabitants came privately to inform me that

* *Vide Statistical Account of Assam, Vol. II, page 355.*

they had certain intelligence that the Mahammadans meditated an assault upon our Government on that day, and that it would likely commence by an attack on the Hindu temples in the town. I told them that I could not believe it, as they had hitherto shown no indication of riot. My military force at that time being a good deal scattered in the Province, not more than forty or fifty men could be mustered fit for duty, and I desired my *jemadar*, or black officer, to have all in readiness in case of a fray. Nothing occurred during the day of the festival, until five in the evening, when the Hindu inhabitants rushed into my house in numbers, covered with marks of violence they had received from Mahammadans. I went into my room for a few minutes, dressed my pistols and gave them to my favourite black servant, desiring him to keep near me, and, if he saw me in danger, to put them into my hand. I carried a light horseman's sword under my arm. There was no time for delay, as the town was on fire in different directions. With my small force I marched to the place where the crowd was collected, and found to my surprise that the numbers were much more considerable than I expected. As I advanced they retired to a strong position upon a hill, and there took post. I followed them to the top, and drew up my sepoy on a table-ground directly opposite to them, where they stood with shouldered arms. I then went forward with my black officer to hold a parley on the spot. I found their leader a priest of considerable rank, at the head of three hundred men. He was insolent in his manner. I was perfectly calm. I told him that I presented myself before him in the capacity of Head Magistrate; that I was informed a fray had happened, which I would investigate next day, and render justice where due; that my object at that moment was to compel him to lay down his arms and retire peaceably. He immediately drew his sword, and exclaiming with a loud voice, "This is the day to kill or to die,—the reign of the English is at an end!" aimed a heavy blow at my head. This I was fortunate enough to parry; but he struck so hard that my sword was broken, and a little more than the hilt remained in my hand. My black servant at the same moment thrust a pistol into my hand, which I instantly fired, and the priest fell; and so close were we in contact that his clothes were set on fire. My sepoy in the rear, seeing my dangerous situation, discharged a platoon while I stood in front, from which I miraculously escaped. My black officer and I rushed back into the ranks in time to prevent their giving way. We then charged with bayonets and drove the armed multitude over the hill.

"I had now time to look about me and survey the mischief that had been done in so short a time. The high priest and his two brothers were lying dead on the ground, and many of his dependents were wounded. On my side one sepoy was killed and six wounded. Most fortunately my people did not give way—if they had, every European in the place would have fallen. I now asked for my assistant, Mr.—, who I supposed had been killed; he soon appeared, and candidly informed me that the scene was too much for his nerves, and that he had retired during the combat. This event was of too serious a nature not to be reported to Government. They immediately ordered a reinforcement of troops, supposing me under temporary difficulty; but the tumult soon subsided, and the order was countermanded."

Mr. Lindsay was a firm and resolute Collector, but the strength of his conviction that there would be no renewal of the disturbances, and his refusal of the proffered reinforcements, suggests that the number of rioters who fell was larger than he felt disposed to say. Again in 1786, one Radha Ram, a zamindar on the eastern frontier of the district, attacked the Chargola thana, with a following of Kukis, and killed and harried the villagers. Mr. Lindsay promptly despatched some sepoys to the place with instructions to burn the villages of Radha Ram's people, and to lift his cattle; and in a very short time the zamindar himself was seized. The letter that reports his capture to Mr. (afterwards Sir John) Shore curtly announces the annoying fact that a tribe of hillmen had surprised the thana of Laur, killed the thanadar and twenty of his men, and made their way back into their mountain fastnesses. During the declining days of Mughal rule the administration had been lax, and it was some years before the people learned that the authority of the Company could not be set at defiance with impunity. The fact that at this time there

were neither criminal nor civil courts in Sylhet was also said to be a source of difficulty. Suitors had to proceed to Sultansi which was a considerable distance from their homes.

The aggressive conduct of the Burmese in 1824 caused some anxiety in Sylhet. Troops ^{Burmese War in 1824.} were at once pushed up to the frontier fort at Badarpur, and, when the enemy approached, they advanced into Cachar and inflicted a severe defeat upon them at Bikrampur. The Burmese then withdrew, but in June it was reported that they were again advancing, and, in spite of the inclement weather, reinforcements were hastily despatched towards the frontier. Sylhet itself escaped the inconvenience of a raid, but great difficulty was experienced in obtaining transport for the expedition. Boats, which had to be sent up to Badarpur, were manned by 50 persons, most of whom were witnesses who were waiting to give evidence at the cutcherry and had been summarily impressed ! " With the greatest difficulty and by subjecting our own subjects to the most dreadful privations and sufferings " 7,000 men were gradually collected, but they charged the guards who were set over them, and broke through every opposition. Apart from their reluctance to accompany the expedition, the Commissioner doubted whether the coolies would be able to carry to Manipur more than the provisions required for their own consumption on the way. The people fled panic stricken from their homes to escape impressment, the fields remained untilled, and the Magistrate was compelled to warn the General in Command that famine might ensue. Stories of the impressment of

the people travelled up to the Khasi Hills, and added to the difficulty of obtaining labour when the road to Assam was being constructed in 1829. The Khasis are, and always have been, an extremely independent people, and the accounts they heard of the way in which coolies had been seized in Sylhet at first rendered them disinclined to do any work for Government.

About the time that Sylhet was freed from the fear of marauding raiders from the north, the wild tribes from the southern hills began to make incursions on the plains.

Raid from the South. Kuki outrage in 1826.

The first outrage on record occurred in 1826, when a party of wood-cutters was murdered by Kukis. Messengers were sent up into the hills, and ascertained that the cause of the outrage was the failure of the zamindars of Pratapgarh to make their customary presents to the tribesmen. The Kukis took this opportunity of clearly laying their demands before the Government, and detained two of the envoys as hostages, while the third was sent to fetch the ransom of the other two. Government paid the money to obtain the release of its two emissaries, and orders were issued for the exclusion of the Kukis from our markets.

In 1844, Sylhet was the scene of a far more serious outrage. Laru, a Poitlu chief of some importance, died, and his son Lal Chokla determined to give him a funeral worthy of his merits. On April 16th, he descended upon the Manipuri colony of Kochabari in Pratapgarh, and in the darkness of the night succeeded in securing twenty heads

Twenty men killed in 1844.

and six living captives. Efforts were made to obtain redress through the Raja of Hill Tippera, and when they proved fruitless, an expedition was despatched, under Captain Blackwood, into the hills. He succeeded in arresting Lal Chokla, who was brought down to the plains, tried, and sentenced to transportation for life, in spite of his plea that he did not know that the Manipuris were under British protection, a plea in which very little reliance could be placed.

Three years later the Kukis again descended from their hills, and massacred upwards of 150 persons. After prolonged investigation, it was ascertained that the scene of the outrage lay outside British territory, and it was left to the Raja of Hill Tippera, in whose country the incident occurred, to take such action as he thought to be desirable. Further raids were, however, made within the boundaries of the district in 1849, and, as even more serious outrages were reported from Cachar, Government determined to send an expedition into the hills. A force was despatched under Colonel Lister which captured one village and then withdrew, as the officer in command did not consider that it was sufficiently strong to justify his advancing further through such difficult country, against so powerful an enemy.

Raids in 1847 and 1849 followed by Colonel Lister's expedition.

In 1862, Sylhet was raided again, three villages about eight miles from Adampur were plundered and burnt, and a large number of the inhabitants massacred and carried off. Government ordered that a strong force of armed

Further raids followed by abortive expedition of 1869.

police should be established somewhere on the Sylhet frontier, and pressure was put upon the Raja of Hill Tippera, as it was thought that his subjects were to some extent responsible for these raids. At the end of 1868, a village near Adampur was again attacked, and as this was only one of several outrages along the southern frontier of the Province, an expedition was despatched into the hills. The climatic conditions were, however, most unfavourable, the central column was detained by seven days' continuous rain which rendered the route impracticable, and the troops were compelled to retire without either rescuing the captives or punishing the guilty tribes.

In January 1871, the village of Kacharipara near the Chargola outpost was burnt, and 20 persons killed, and an attack was made on another village immediately opposite to the outpost. Five weeks later a village near the Alinagar outpost was raided ; but these were merely incidents in the general outbreak that occurred along the frontier. Such continuous and sanguinary raids called for vigorous repressive measures, and in 1871-72, a strong force was sent into the Lushai Hills, the troops advancing in two columns from Cachar and Chittagong. Since that date the peace of the Sylhet district has been undisturbed, though further outrages on other portions of the Indian Empire rendered the annexation of the Lushai Hills a disagreeable but unavoidable necessity.

The history of the Lushais and their raids will be found in greater detail in the gazetteer of the Lushai Hills, and reference has only here been made to the

comparatively small number of outrages perpetrated in Sylhet.

Towards the latter end of the eighteenth century the district suffered from a succession of heavy floods, which, if implicit reliance can be placed upon the records, produced effects of the most appalling character.

Floods and bunds.

In 1781, the country was desolated by an inundation which is described by Mr. Lindsay in the following terms : *

"In 1781, and also in the preceding year, there had never been such bountiful crops of rice, insomuch that the granaries could not contain it, and the value of the commodity was so extremely depreciated that it would not pay the expense of carrying it to market. I was, therefore, under the necessity of stating to Government the total inability of the farmers to pay their rents, especially as, in this poor district, they had not the same resources as elsewhere, rice being our only source of revenue. A suspension of rent was in consequence allowed. No sooner was the indulgence granted than one of those dreadful inundations took place to which the country is subject, which in a few weeks involved the whole country in general calamity. The river, from being very low, rose thirty feet perpendicular, overflowing its banks and sweeping everything before it. A more dreadful scene could not be imagined, nor could relief be given to the numerous objects who were seen perishing in the torrent, — the cattle and wild animals of every description were observed indiscriminately floating down the stream. The granaries upon the banks, filled with the late superabundant harvest, were all swept into the flood, and thus from a general plenty we were in the course of ten days reduced to a state of famine. All was gone excepting a few partial stores on the high grounds. The first thing I did was to despatch express boats in every direction, to bring back the grain we had sent from the Province sometime before, now finding its way to distant markets. In this we succeeded, and part was brought back, but we had a dreadful prospect before us : the greater part of the last year's

* *Vide Statistical Account of Assam, Vol. II, page 354.*

crop was destroyed, and, what was worse, the rice lately planted was so completely laid under water that it could offer no hope of relief.

"My own case was embarrassing, for I had now to give the Supreme Board an account directly opposite to that I had lately furnished. Government, however, immediately assisted us ; but at the same time, my story appeared so very improbable that they sent up a confidential person to report to them, from ocular demonstration, the actual state of the country. From the scarcity that prevailed, this gentleman never reached me ; but his report of the desolation and misery he saw in the lower country fully corroborated my previous statements, and Government, in consequence, gave much assistance, but I am sorry to say nearly one-third of the population died.

"I must here mention one instance of the industry of the people at this juncture. They sent up and brought rice plants from the seed beds on the high grounds ; but, their low lands being under water, they were obliged to plant them in a manner not altogether new, but seldom practised, and to which I was frequently an eye-witness. The work is carried on in canoes. In one end of the boat were deposited the rice plants, on the other side a heap of well-tempered tenacious clay ; the boatman, holding two or three rice plants in his left hand, attached to each a lump of clay and dropped it into the water ; it thus became anchored in eighteen inches of water. Many hundred acres of ground were thus cultivated ; and this furnished in due time a considerable resource, so as to save many of the inhabitants from famine. In the situation so described, provided the flood during the periodical rains rises gradually, the plant will grow to the height of twelve or fourteen feet, always keeping its head above water ; but if rapidly overflowed and depressed under water, even for one night only, it never recovers.

"Upon going to Dacca a few months afterwards, I saw many instances of men and women diving from their canoes to tear up from the bottom roots of grass and other vegetables as a miserable food for their famished cattle. Nor were the sufferings of the unfortunate natives yet ended. When the new crop was nearly ready for use, no persuasion could prevent them from satisfying their craving appetites, the frequent consequence of which was immediate death, or diseases which occasioned dropsy and dysentery, which destroyed many."

Three years later there were again complaints of flood. The waters, according to the
More floods in 1785.

Collector, rose to a height to which they had never before attained within the memory of man, the houses in the town were most of them submerged, and large quantities of cattle and many human beings perished.* In September, it was said that the country from the banks of the Brahmaputra to Sylhet was like an open sea, dotted over with islands on which the people were living in a pitiable state; that two-thirds of the cattle had died, and that the villagers were endeavouring to save the lives of the remainder by diving to the bottom and scraping up weeds and roots of grass. Early next year, Mr. Lindsay told the Board that over two-thirds of the cattle had been swept away and drowned, or starved from want of fodder, and, that one-fourth of the inhabitants of the low lands had perished, either from starvation, or from the diseases that are commonly induced by unwholesome or insufficient food.† In 1787, the Collector again reported a very serious flood,—the low parganas were entirely under water, the greater part of the cattle were drowned, and those that survived were kept on bamboo rafts. “The face of the whole country exhibits an extensive sea, and, where villages formerly stood, may be seen at a distance little mounds rising out of the waters, which on a nearer approach are perceived to be the wrecks of the habitations of the distressed raiyats. It is painful to recall to your recollection the distress of 1784, at the thought of which humanity

* Collector's letter No. 46, dated 25th June 1784.

† Collector's letter No. 56, dated 13th March 1785.

shudders, but the waters are higher now than they ever were at any period of that year, and the damage is infinitely greater." * There were heavy floods also in 1793 and again in 1795.

Under native rule the Surma had been protected by a dyke, but this work had been allowed to fall into disrepair, and in 1790, **Protective works.** Mr. Willes constructed an embankment for a length of about one hundred miles along the side of that river. Six years before, the Supreme Government had sanctioned the expenditure of Rs. 8,000, on the repair of bunds along the Surma, Kusiya and Manu,† and dykes were also kept in repair by native land-holders at their own expense. In 1814, the idea seems to have gained ground that these bunds were of comparatively little use. They were accordingly allowed to fall into disrepair, and, at the present day, the only one maintained is a dyke along a portion of the Surma river. The annual rainfall is so enormous, the general level of the country is so low, and the whole drainage system is of such a complicated character, that it is extremely difficult to control the action of the rivers. Nullahs and embankments that protect one village may very possibly do damage to another, and the greatest caution has to be exercised when tampering with the drainage of the country.

It is difficult to understand why, at the end of the eighteenth century, Sylhet should have **Were these floods really so severe?** been so much more liable to flood than it is at the present day. It is possible that the whole level of the district has been raised during

* Collector's letter No. 80, dated 11th July 1787.

† No. 38 A. from J. Shore, dated 30th December 1784.

the last hundred years ; it is possible that there was a cycle of exceptionally wet years, just as at the end of the nineteenth century, the rainfall throughout India was exceptionally scanty ; and lastly it is possible that the floods in reality were not abnormally severe, and that what so impressed the imagination of Mr. Lindsay was little more than the usual condition of the country. At the present day almost the whole of the western portion of the district goes under water in the rains. Fodder for the cattle is brought from the hills, or dragged from the bottom as described by the Collector, and the houses of the villagers are crowded together on small islets of highland, which rise up here and there from out of the waste of waters. It is difficult to obtain reliable information with regard to the condition of the people now, it was almost impossible to do so then, and the estimates of mortality, both of men and cattle, were doubtless much exaggerated. The people had the strongest disinclination to pay land revenue, and clutched at any excuse which would relieve them from the necessity of doing so. Even a strong officer like Robert Lindsay experienced the greatest difficulty in realizing the demand, and he was naturally not disposed to minimise any calamity which would help to explain away the large outstanding balances. On more than one occasion the rainfall may possibly have been severe, but it is to be hoped that the sufferings of the people were not so terrible as was supposed.

That there was some distress and scarcity there seems little doubt. In 1788, Mr. Willes reported that rice was selling at Re. 1-8 per maund, though in former years four maunds could be purchased for one

The rice rates however show that there was some distress.

rupee. Such was the general distress that he could not stir from his house without being beset by thousands clamouring for relief.* It must, however, be added that four maunds for a rupee was an exceptionally low rate. In 1786, when rice sold at four and a half maunds to the rupee, the price was said to be so low as barely to cover the cost of cooly hire to the bazar, and in January 1798, the best rice sold at Sylhet for As. 12 a maund. Owing, no doubt, to difficulties of transport, the grain market at that time was subject to sharp variations. Corners in wheat would have had but a short shrift from the administrators of that day. In 1773, the Collector was authorised to notify by beat of drum, that any merchant who concealed his grain and refused to bring it to the market and sell it at a reasonable price, would not only be deprived of all his stock, but would be placed in confinement till orders had been passed upon his case. As a precaution against scarcity the Government had recourse to public granaries, and more than once the Collector was directed to purchase and store a lakh or two of maunds of grain.

The efforts made by France to retain some share of the valuable Indian trade, are illustrated by the action of a certain **European settlers in Sylhet.** M. DeChampigny. This gentleman seems to have come to Sylhet in 1786, with letters of introduction from M. Wilton, the French Commissary. Mr. Lindsay informed the Governor-General that no obstacle would be placed in M. DeChampigny's way, as long as he conducted himself as a private trader. At the same time he pointed out that

* Collector's No. 19, dated 11th February 1788.

the French had never had a public agent in that portion of Bengal, and that they were naturally of an intriguing disposition ; and he hinted pretty plainly that the Frenchman's actions in a turbulent and frontier district, surrounded by savage races who could easily be incited to invade our territory, would always call for careful attention from the Government. M. DeChampigny seems to have lived with Mr. Lindsay, and, during the administration of that vigorous pro-consul, he was wise enough to conceal his real intentions. On the advent of Mr. Willes he ventured to appear in his true colours. He purchased a plot of ground in a very arbitrary manner, the title of the vendor being extremely doubtful. He then began the construction of a fine bungalow, without applying for the consent of Government, as was required by the regulations then in force. When he was in need of stores from the interior, he issued orders on the people under a large seal ; and he claimed to be exempted from the rules that applied to all other traders, under which boats carrying merchandise were compelled to attend at the bunder ghat for registration. He is said to have seized, confined, and fined those persons who offended him. On one occasion he arrested a taluqdar, and, when ordered by the Collector to release him, his servants impudently denied that their master was in any way subject to the authority of Mr. Willes. But, worst of all, he endeavoured to establish political relations with the Khasis, an arrangement to which there were the strongest possible objections. The Khasi Hills were independent territory, Assam and Cachar were still under native rule, and there was serious risk that the French might establish a protectorate on our frontier, which would be a perpetual

source of danger and annoyance. The records are silent with regard to the ultimate fate of this imperious Frenchman. On the outbreak of war in 1804, he probably had to flee the country ; but, for a time at any rate, he was a source of serious annoyance and anxiety to the unhappy Mr. Willes.

In spite of the restrictions imposed on settlers in the interior, there were a considerable number of Europeans in Sylhet a century and more ago. In 1778, Mr. Lindsay despatched two Englishmen, a Frenchman, and a Portuguese to Dacca, 'as no confidence could be placed in them,' and there were still some fourteen Europeans left, who had absconded, apparently from fear that they might share the fate of the other four. In 1799, there were no less than forty-four non-official Europeans in the district. The most important was, of course, the famous M. De Champigny, but numerically the strongest community were the Greeks, no less than thirty-one of whom were engaged in selling salt. They were altogether a distinctly cosmopolitan crew, which, in addition to the Greeks, included three Frenchmen, one Deluc, whose nationality is not specified but who presumably was not English, and a Dutchman who is described as very old and dumb. One cannot help wondering what an old and speechless Dutchman could have been doing in Sylhet a century ago.

In the early days of our administration the revenue of the district was paid in cowries.

The Currency. As Mr. Lindsay says, it is difficult to understand how they became the circulating medium of a country three hundred miles distant from the

sea. The only explanation he could offer was that the people were so poor, and their rents so small, that a currency of extremely low value was required. The rate of exchange varied at different times, but, in Mr. Lindsay's day, four *kahans* or 5,120 cowries went to a rupee, and, as the revenue amounted to Rs. 2,50,000, the Collector had to receive nearly 1,300 millions of these little shells. The inconvenience of such a currency was indescribable. The cowries were generally received in baskets, and when they changed hands, the baskets were divided into groups of ten. The payee then counted one basket in each group, and, whatever deficiency was found in that basket, was supposed to run through the remaining nine. They were not received by weight, as the addition of a little sand would at once have turned the scale, nor by measure, as a little shaking made them settle down. They were fragile, and the Government of Bengal found it necessary to import shells, at a cost of more than a lakh of rupees per annum, to replace those lost and broken in the Presidency.* They were cumbersome to receive, and troublesome alike to store in Sylhet, or to export to Dacca. Efforts were accordingly made by Government to induce the landholders to pay their revenue in rupees, and by 1819, two-thirds of the people had agreed to do so, and only 30,000 *kahans* of cowries were in store. This result was not attained without much difficulty. The price of cowries was raised by declining to issue them from the treasury, and at one time the Collector had nearly 1,100 millions of

* Letter No. 164 A., dated 9th September 1819, from the Board of Revenue to the Collector. The Collectors of Customs at the three seaports reported that 43,000 maunds of cowries were imported every year.

these little shells in the godowns at Sylhet. Arrangements were made to send them to other districts, to distribute them as diet money to prisoners, and to sell them locally ; and gradually this medium of circulation, which assuredly must have been one of the very worst on earth, was banished from the district.

It is interesting to trace the development of the **Development of the excise system.** excise revenue in the early days of British rule, and the small beginnings from which the present system was built up. The consumption of spirituous liquor was naturally regarded with some disfavour by the Muhammadans, a tax of 5 *kahans* or about two rupees, was imposed on each maund landed at Sylhet, and each retail vendor paid a small registration fee of Re. 1 per annum.* For some years after our assumption of the administration no attempt seems to have been made to obtain any revenue from excise, ; but in 1793 the Collector, under pressure from the Board of Revenue, issued licenses to four distillers. The fees received only amounted to Rs. 42, whether per mensem or per annum is not quite clear ; but the actual incidence of the fees was not of much importance, as shortly after receiving their licenses, all the vendors disappeared. Further enquiries led the Collector to report that liquor was only drunk by the fishermen near Ajmiriganj ; but in 1798, he complained bitterly of the evil effects of opium. This, he said, was in very common use, or rather abuse, as the consumption of the drug gave rise to consequences of the most disastrous kind. "Opium if taken to excess, which commonly is the case, brings on an insanity which in general terminates either

* Collector's letter No. 204, dated 3rd April 1795.

in suicide or murder. Instances of such fatal effects are so numerous and so well authenticated by the records of the Fauzdari Court, as to have attracted the particular attention of the Magistrate." * Bhang and ganja were not generally used except by natives who had come from Hindustan. It is, however, doubtful whether the opium habit was as prevalent as the Collector thought. In 1814, the total amount of 'koppah' used in the district was said to be some 60 maunds, but, as 'koppah' consists of strips of cloth soaked with poppy juice, the actual weight of the drug was only 40 maunds, which certainly was not a very large amount. 'Koppah' sold for Rs. 6 per seer in Sylhet, and Rs. 4 in the mofussil. The lack of definite knowledge on the subject is well illustrated by the fact that, three years later, the Collector said that only one-third of 'koppah' was actually opium, and that it sold from Rs. 6 to Rs. 10 per seer. It was subsequently proposed to charge a fee of Rs. 6 per annum for each license for the retail sale of ganja, Rs. 12 for opium, and Rs. 18 for "muddad," presumably madak. Two country spirit shops were settled at a rental of Rs. 17-4 per mensem, a fee that is in marked contrast with that now paid for the Sylhet shop which, in 1904, amounted to Rs. 738 per mensem. Other shops outside the town paid from one-half to one-sixth of this very moderate demand. Even these small fees were found to be prohibitive in their effect, and in 1800, not a single license for the preparation and vend of spiritous liquors was taken out. In 1808, the Collector raised the license fee to As. 8 a day. This proposal found no favour with the Magistrate, who thought that, in view

* Collector's letter No. 216, dated 3rd June 1798.

of the large illicit trade in drugs and liquor, the fee should be within the reach of the poorest purse, and should not exceed As. 2 per diem. In 1813, the Collector estimated that one-half, or at the lowest calculation one-third of the population of Sylhet town, which, by the way, he calculated to be no less than 30,000 souls, drank spirituous liquor, and complained of the facility with which illicit distillation could be carried on. Two years later the practice was inaugurated of issuing Government opium from the Treasury. The price charged was Rs. 25 a seer, and the amount sold in the first two years was less than two seers. The price was then lowered to Rs. 20, and afterwards to Rs. 10, and a daily tax was imposed upon the vendor. This concession, coupled with a stern repression of the illicit opium traffic, sent up the issues in 1821-22 to over 24 maunds. Sylhet, however, has never been a great opium-eating district, and in 1904, only 16 maunds were issued from the Treasury.

It is sometimes thought that the salary of a Collector in the early days of British rule was small ; and that, though there are now fifteen rupees to the sovereign instead of eight, as in Mr. Lindsay's day, the fall in exchange and the withdrawal of the right of trade have been fully counter-balanced by an increase in the scale of pay. This does not seem, however, to have been the case. Mr. Lindsay's salary was fixed at Rs. 1,500 per mensem in 1787, and he was further granted a house allowance of Rs. 150 per mensem.* Whether he travelled by water or by land he drew a travelling allowance of Re. 1-1 per mile, as com-

* Letter No. 70A., dated 12th April 1787, from the Assistant Secretary to the Governor-General.

pared with the four annas and eight annas of the present day, though boat and cooly hire must have been much lower a hundred years ago than they are now. Mr. Lodge's travelling allowance bill for the journey from Calcutta to Sylhet in 1794 was no less than Rs. 1,061.* Again in 1825, the Collector was allowed an aggregate salary of Rs. 2,510 per mensem, a larger sum than is drawn by any Collector at the present day.

But, if the salaries a hundred years ago were far from small, the expenditure on public works was very light. The *Public offices.* catcherry itself was a very modest building. Mr. Ahmuty, at the end of the eighteenth century, reported that he had erected "a *pucka* godown divided into three apartments wherein the public records of my office have been ever since deposited; independent of which I rent two bungalows, one of which is occupied by the mohurrirs and writers, and the other appropriated to the use of my public catcherry." The Governor-General desired that a suitable building should be provided for the Collector's office. That officer replied that if a proper building was to be constructed it must be at least equal in size to a common dwelling-house, and contain four commodious rooms with verandahs on the north and south. The cost of such an office if made of the best materials would not be less than Rs. 10,000. The office erected for the Deputy Commissioner, after the earthquake of 1897, had a floor space of 35,000 square feet

* Collector's letter, dated 5th March 1794. The distance from Calcutta to Sylhet was said to be 998 miles, and mileage drawn accordingly. The Accounts Department at the present day hold that the distance *via* the Sundarbans is only 709 miles. It does not appear whether the same rates were allowed for journeys in the district.

including the verandahs, and though built after a plan in which economy is carried to the very verge of meanness, cost Rs. 1,68,000. The estimate sanctioned for the construction of a jail at Sylhet in 1788 amounted to Rs. 2,500, and affords a striking contrast to the Rs. 1,66,000, which have lately been expended on the existing institution. The godowns in which the myriads of cowry shells were stored were erected by the Collector at his own expense, and leased by him to Government. Mr. Lindsay says that they cost him Rs. 8,000, and he charged a rent of Rs. 100 per mensem, which for those days seems moderate enough.

One of the most serious disabilities under which the people of Sylhet labour at the present day is the want of proper treatment when they succumb to the unsanitary conditions in which their lives are passed, but the Medical Department has fortunately made some advance since the days of Mughal rule. In 1789, Mr. Willes complained that one Mohammad Jaffar was acting as medical adviser to the Nawab at Dacca, in spite of the fact that he held a grant of land worth Rs. 900 per annum, which had been given to his predecessors by the Mughal Government in consideration of their undertaking the duties now assigned to the civil surgeon of Sylhet. Mr. Willes requested that this gentleman might be sent back to the district to which he properly belonged, as the people were in great distress from want of either a Muhammadan or Bengali doctor. The unfortunate civil surgeon was expected to devote fully half of his annual grant to the purchase of medicines; but it is to be presumed that he was allowed to add by private

A Civil Surgeon of the 18th century.

practice to the modest stipend he received from Government.

In the *Friend of India* of February 9th, 1837, the following gloomy account is given of the condition of the district. The writer seems to infer misery and deterioration from the fact that the revenue is not easily collected; but the difficulty experienced in realizing the very small Government demand, a difficulty which is experienced now as then, is due to other causes :—

Sylhet in 1837.

“ In the sitting of the Board of Revenue on the 30th of January last, the present state of the district of Sylhet was brought under consideration. That district during the last forty years has been subject to a gradual deterioration; and has at length, reached that point of wretchedness which naturally produces a reaction. Forty years ago, it was, comparatively speaking, in a flourishing state; now it is a complete pauper warren. In the whole district there are not fifteen landed proprietors possessed of Rs. 5,000 and the condition of the great bulk of zamindars is in the last degree wretched. But it is of late years that the deterioration has taken the most rapid strides. In 1821, the district was in so prosperous a state, that a sale of land for arrears of revenue hardly ever took place. Even as late 1829, there were but sixty-three estates sold by the Collector; in 1834, the number of estates sold rose to about 250; the next year, the number was doubled; and in the past year, it had reached the extent of 1,004. At the close of the last accounts, it was found, that though the assessment of the entire district did not much exceed three lakhs of rupees, two lakhs of this sum remained unpaid, and that it became necessary to advertise 26,250 tenures for sale. But what is to restore comfort and security to the vast population whose sole dependance is on the food raised in a district, in which every estate, with the exception of a small fraction, is put up to sale? To complete the misery of the district, these sales, it appears, are attended by a set of speculators, who bid for the forfeited estates, though not themselves possessing more than the amount of the deposit money; and whose hope of gain in this lottery of desolation, is built on their being able to sell their purchase to advantage, before the settling day arrives.”

Sylhet did not escape unscathed from the troubles of 1857. In December a party of the
1857. Chittagong mutineers entered the south of the district, with the evident intention of pushing on through the Surma Valley to Manipur. A detachment of the Sylhet Light Infantry, under their Commanding Officer, the Hon'ble Major Byng, started to Pratapgarh to intercept them, but on arriving there learnt that they had changed the direction of their march, and were then in the neighbourhood of Latu. The troops immediately started for that place, and on reaching it had barely time to form, when the mutineers came into sight, advancing in good order. A smart action took place, and the enemy, though undoubtedly superior in numbers, broke and fled, leaving 26 dead upon the field. Our own loss was small, and consisted of five dead and one severely wounded, but Major Byng was unfortunately amongst the killed. It was impossible to follow up the mutineers with any hope of success through the jungle covered hills into which they had fled. Detachments of men were, however, posted so as to intercept their march towards Manipur, and a native officer, who had been sent with sixteen men to attack ten of the enemy who were lurking in the jungle near Latu, succeeded in killing eight of them. On the 23rd of December the mutineers entered Cachar ; but the pursuit was still maintained, and they were engaged and defeated on December 23rd, January 12th, January 22nd and January 26th. They were now completely disorganized and dispirited. They were destitute of all supplies, and some were found lying in the jungle, having died of actual starvation, while others were despatched by Kuki scouts, who had been offered a reward for every sepoy killed. It

is believed that out of the three companies which left Chittagong not three or four men escaped death or capture.

The district is not rich in archæological remains of interest. Mosques are numerous, especially in North Sylhet, but most of them are still used as places of worship, and are described in the following chapter. Two miles north-east of the Patharkandi police station there are the remains of the Fort of Raja Pratap Sing, a petty local notable who has given his name to the Pratapgarh pargana. Reference has been already made to the ruins in South Sylhet associated with the names of Subid Narayan and Khowaj Osman, and in pargana Bhanugach in the same locality there is a fort attributed to Chandra Singh. This man belonged to the family of the Tippera Rajas and is said to have moved from the hills into the Sylhet plains about the seventh century, A. D.

CHAPTER III.

THE PEOPLE.

Density—Towns and villages—Growth of population—Migration—Sex and marriage—Infirmities—Language—Caste—Brahmans—Sudras—Caste distribution—Muhammadanism—Mosques and tombs—Hinduism—The Shahaj Bhajan—Sacred places—Akhras—Christianity—Occupations—Leading families—Marriage customs—Hindu festivals—Amusements.

Sylhet covers an area of 5,435 square miles, and, though there are parts of it which would not generally be considered desirable places of habitation, it supports a much larger population than any other district in Assam. In 1901, the density was 412 to the square mile. This was greatly in excess of the figure for the Province as a whole (109), though considerably below that of the two Bengal districts which adjoin Sylhet on the west : Mymensingh, where there was a density of 618 persons to the square mile, and Tippera, where the density was as high as 848. The statement in the margin shows the density by subdivisions. In the northern part of Sylhet, the floods of rain that are precipitated on the southern face of the Assam range, and the heavy local fall convert the plain into a swamp at certain seasons of the year. In the centre of the great depressions, or basins, with which

	Density of Population.	No. of persons per square mile.
Sonnaganj ..		391
North Sylhet ..		489
Karimganj ..		392
South Sylhet ..		461
Habiganj ..		556

this locality abounds, the cultivation of hot weather crops is quite impossible, and there is no high land available for village sites. The Dharmapasha thana has a density of only 246, over a total area of 321 square miles, while in the Sunamganj thana, which adjoins it on the east, there are only 262 persons to the square mile. In the Jaintia Parganas which, roughly speaking, are enclosed within the Surma river, the Piyaingong, and the Jaintia Hills, the density (250) is slightly less. Towards the centre of the district population increases, and in the Balaganj thana, over a total area of 222 square miles, there is an average density of 640 people to the square mile. The whole of the Habiganj subdivision is very fully peopled, the density ranging from 493 in the Baniyachung thana to 651 in the Madhabpur thana in the south-west corner of the district. Population is also fairly dense in South Sylhet, as the low ranges of hills, which are unfit for the growth of ordinary crops, have been to a great extent cleared and planted out with tea. In Karimganj population begins to fall off, as a large proportion of the surface is covered with the Chhatachura, Pratapgarh, and Pathariya hills ; and the upper valleys of the Langai and Singla have not yet been opened out for cultivation. Taking the thana as a unit, it cannot be said that any portion of the district is sparsely peopled, as nowhere is the density less than 246 to the square mile. Population is, however, comparatively sparse in the belt of land lying at the foot of the hills along the northern frontier, is somewhat denser on the eastern frontier, and is positively congested in the central and south-western portions of the district. The density in each thana in 1901 will be found in Table II.

Sylhet contains five small towns and 8,330 villages.

Towns and villages.

Town.	Population 1901.
Sylhet ..	13,893
Karimganj ..	5,692
Habiganj ..	5,736
Sunamganj ..	2,520
Maulavi Basar ..	2,481

The population of these towns at the census of 1901 is shewn in the statement in the margin. Seven-eighths of the villages are reported to be small hamlets with less than 500

inhabitants, and there were only 54 with a population ranging from two to five thousand souls. Little reliance can, however, be placed upon these figures. The villages are not, as in some Provinces of India, clusters of huts which stand out clearly in the centre of the fields tilled by their inhabitants. Rice, the staple crop, is grown in wide plains, dotted over with clumps of bamboos and fruit trees, in which are buried the houses of the cultivators. Except in the flooded tracts, it is groves and not villages that the traveller sees when riding through the more densely populated portions of the district, and not a house can usually be discerned till he has penetrated this jungle of plantains, betelnut trees, and bamboos. It is thus difficult to tell where one village ends and another begins, or to which of the larger clumps of trees should be assigned the smaller clumps which are freely dotted about amongst the rice fields, and the village as a statistical unit is of little value.

The earliest estimate of the population is one made by Mr. John Willes in 1789. He reported that there were altogether 492,945 people in the district; but his figures were evidently very much below the mark, and in 1813 the Collector made a much more reasonable estimate of 1,500,000 persons. In 1853, Mr. Mills calculated that the

population was about 1,393,500, this figure being apparently obtained by multiplying by five the number of houses reported by the police. This estimate was much more plausible than one framed by the Survey Department in 1860, which only amounted to 795,272 souls. In 1866, the Collector stated that, including the Jaintia Parganas, the whole population of the district might be fairly estimated at 1,000,000, or half a million less than the guess made by his predecessor 50 years before. The census taken a few years later in 1872 showed that his estimate was ridiculously low.

The statement in the margin shows the population recorded at each of the four last enumerations, with the percentage increase occurring in each decade. Part of the increase disclosed in 1881 was, no doubt, due to the inaccuracy of the enumeration of 1872. In the next decade there was a fair expansion of the population, but much of this was due to immigration; and the natural growth, *i.e.*, the increase in the number of persons born and censused in the district, only amounted to 5·8 per cent. in the ten years. In South Sylhet, where there was a great development of the tea industry, the gross increase amounted to as much as 16 per cent., and in Karimganj, where similar causes were in operation, there was an increase of 12 per cent. In Habiganj, on the other hand, the increase was less than 6 per cent. During the next decennial period the gross increase amounted to 4 per cent. This in itself is small enough, but more than half of this was due to immigration, and the number of persons born and censused in the district

	Population.	Percent- age variation.
1872 ..	1,719,539	
1881 ..	1,969,009	+ 14·5
1891 ..	2,154,593	+ 9·4
1901 ..	2,241,848	+ 4·0

only increased by 1·9 per cent. The local variation in the population is thus described in the Report on the census of Assam in 1901.* “From the statement in the margin it appears that, while in one subdivision there has been an increase of nearly 10 per cent., in another there has been a decrease of nearly 4.

Distribution of population by Subdivisions.

SUBDIVISION.	Popu- lation 1901.	PERCENTAGE VARIATION.	
		1891— 1901.	1881— 1891.
Sunamganj ..	433,752	+ 4·9	+ 8·0
North Sylhet ..	463,477	— 8·9	+ 7·9
Karimganj ..	410,460	+ 6·7	+12·0
South Sylhet ..	379,168	+ 2·5	+16·3
Habiganj ..	555,001	+ 9·9	+ 5·5

Habiganj has increased by 9·9 per cent., and, though there has been a substantial increase in the number of persons censused on tea gardens, the general population has increased by 7·3 per cent. In Sunamganj also there has been a very fair natural growth of the population, the increase amounting to nearly 5 per cent.; and as this cannot be considered a particularly healthy portion of the district, lying, as it does, at the foot of the Khasi Hills, there is no need to be dissatisfied with the progress made during the decade. The same cannot, however, be said of Karimganj, for, though the increase in the total population amounts to 6·7 per cent., the greater part of this is due to the tea industry, persons censused outside tea gardens having only increased by 2·5 per cent. In South Sylhet, the state of affairs is still more unsatisfactory, as the population outside tea gardens has actually decreased by 3·9 per cent. during the last ten years, owing to the ravages of malarial fever; while in North Sylhet the total population is less by 3·9 per cent. than it was ten years ago.” The decrease in the sadr subdivision was ascribed to a wave of malarial fever, which

* Page 15.

was unusually virulent in 1897 and 1898, and there can be little doubt that, in the middle of the nineties, Sylhet, like most of the other districts in Assam, was suffering from abnormally unfavourable conditions.

Sylhet is one of the most important tea districts in the Province, and during the ten years ending with 1900 over 141,000 coolies were imported to its gardens. But the indigenous population is so large that, at the last census, foreigners, *i.e.*, persons born outside the Province, formed only a little more than 7 per cent. of the total population. This proportion is unusually low for Assam. In the Province as a whole, foreigners formed nearly 13 per cent. of the persons censused there in 1901; and in the four other districts in which the tea industry is of considerable importance, *i.e.*, Cachar, Darrang, Sibsagar and Lakhimpur, the rates varied from 24 to 41 per cent. The distribution varies considerably by subdivisions. In South Sylhet foreigners formed 16 per cent., and in Karimganj 10 per cent. of the total population; whereas in Sunamganj they were only 4 and in North Sylhet 3 per cent. of the persons censused within the subdivisinal boundaries.

The total number of foreign immigrants was 164,895, but a considerable proportion of these persons were not

Immigrants from Mymensingh ..	16,389
Hill Tippera and Tippera ..	11,690
Dacca	5,428
Total ..	<u>33,407</u>

members of the cooly castes.

The statement in the margin shows that over 32,000 persons had entered Sylhet from

Hill Tippera and the three neighbouring districts of Bengal. No less than 30,000 of these people were

found in the frontier subdivisions of Sunamganj and Habiganj, so that it is not unreasonable to suppose that most of them had only moved across the border—a few miles from their former homes, and thus belonged to a quite different category from that in which the garden cooly must be placed. Sylhet, however, gains nothing by this movement of the population, as the number of persons who were born in Assam, in this case practically Sylhet, and were censused in the four adjoining districts

Emigrants from Assam to Hill			
Tippera	..	..	16,106
Tippera	..	..	8,067
Mymensingh	..	..	9,890
Dacca	..	..	2,340
Total			36,393

of Bengal, was over 36,000.

Nearly half of these people were found in the neighbouring state of Hill Tippera.

There is plenty of waste land still available here, which the authorities are willing to lease out on easy terms, and which forms a great attraction to the inhabitants of the densely populated subdivision of Habiganj. There is a good deal of inter-marriage between Sylhet and Tippera and Mymensingh, and, as there are no natural frontiers, it is only to be expected that there should be a certain amount of movement across the boundary of the Province. The majority of these people go to Bengal as servants, cooks, priests, and shopkeepers, as the pressure on the soil is as severe there as in their native district.

Turning to the Provinces and divisions from which the coolies come, it appears that the proportion of immigrants from Chota Nagpur (24,627) is comparatively low. This is due to the fact that natives of the United Provinces thrive better in the Surma Valley than in Assam Proper, and are employed by planters in place of the true jungly cooly who is difficult and expensive

to procure. Three-fourths of these Chota Nagpuris were found in the two subdivisions of South Sylhet and Habiganj. 51,068 natives of the United Provinces were censused in the district, most of whom come from Ghazipur and Azamgarh. Nearly one half of these coolies were living in the Karimganj subdivision, and most of the remainder in South Sylhet. 13,144 persons came from the Central Provinces, chiefly from the districts of Bilaspur and Jabalpur; and over 10,000 from Madras. Unlike the Assam Valley, the number of settlers from Nepal is very small.

Sylhet, as is only natural, loses largely by inter-district migration. Most of this takes place with the neighbouring district of the Cachar Plains, to which Sylhet sent 25,971 persons in 1901, though it received only 4,111 in return. This does not, of course, represent the loss to Sylhet in the single decade 1891—1901. Cachar itself is now fairly densely peopled, and most of these Sylhettis moved into it some years ago. The actual increase at the last census over the figures for 1891 was only 2,259; but, to provide for this increase, and to make good deficiencies caused by death, must have required the emigration of about 8,500 persons from Sylhet to Cachar between 1891 and 1901. It need hardly be said that the district can easily afford to spare these men. In places there is considerable pressure on the soil, and it is hoped that now that the railway has been completed through the North Cachar Hills, some of its teeming thousands may pass across into the fertile plains of the Assam Valley. Details with regard to the proportion of immigrants in each subdivision will be found in Table IV.

The proportion of women in 1901 was fairly high, (964 to 1,000 men) and considerably exceeded the proportion for the Province as a whole. This was, however, largely due to the emigration of men in considerable numbers to Cachar, and to the fact that the proportion of the sexes was not, as in the other tea districts, seriously affected by immigration. If these two factors are eliminated, and the proportion calculated on the natural population, *i.e.*, those born in the district and censused in the Province, it will be found that there were, in 1901, only 958 women to every thousand men, a figure which was 4 below the average for the plains districts as a whole. The ratio between the sexes has shown little tendency to change, and, taking those born and censused in the district, the proportion of women was practically identical at the three last enumerations. Few things are more obscure than the causes which determine the proportion of the sexes, but one factor which is known to operate adversely on female life, *i.e.*, infant marriage, is unfortunately in existence in Sylhet.

The statement in the margin shows the percentage of Hindu girls under ten, and between ten and fifteen, who have performed the marriage ceremony ; and the proportion of Hindu girls between fifteen and twenty who are still unwed. Similar figures are given for Muhammadans, and for the Hindus of Nowgong, who are fortunately free from the ideas that in Bengal "have

Percentage married and widowed amongst girls aged.		Percentage unmarried amongst girls aged.

Muham- madans. }		

succeeded, without a shadow of textual authority, in bringing about the monstrous abuse that the girls of the upper classes commence married life at the age of nine years, and become mothers at the very earliest time that it is possible for them to do so."* The contrast between the figures is very striking. In an equal number of little Hindu girls under ten, there are 17 who have performed the marriage ceremony in Sylhet, for every one who has been hurried into matrimony in Nowgong, and the contrast at the next age period is almost equally pronounced. Over 15 the number of unmarried maidens in Sylhet is very small, and many of them, probably, suffer from some physical disqualification which seriously affects their chances in the marriage market. The effect of contact is also clearly shown. The Muhammadans have, to a great extent, adopted the fashions of their Hindu neighbours, in spite of the obvious disadvantages of union with a little girl, instead of with a full grown young woman ; disadvantages which are not minimised in their case by any foolish dictates of tradition.

The future of the district can to some extent be judged by the proportion borne by the reproductive element, which in this case may be fairly taken as married women between the ages of 15 and 40, to the total population. Out of every thousand persons censused in Sylhet in 1901, 161 were potential mothers, a proportion which was slightly higher than that prevailing in the Province as a whole (157). As compared with the Central Provinces and Bengal the district is, however, handicapped in the race for population, as in the former

* Report on the Census of India in 1901, p. 433.

Province there were 169, in the latter 165 potential mothers per mille in 1901.

The abstract in the margin shows, out of 10,000 males, the number afflicted with the four special infirmities selected for record at the census of 1901. The figures for males only have been given, as concealment is more likely to occur in the case of women, and in their case the figures for leprosy seem undoubtedly to be incorrect. The number of persons afflicted with this terrible disease is unusually large, and an asylum has been opened at Sylhet for the reception of pauper lepers. The total number of males suffering from this disease in 1901 was 1,728. The number of leprous women was in all probability, not much smaller, though the number actually returned was only 422. Deaf-mutism and blindness are also fairly prevalent.

Bengali is the ordinary language of the district and was returned by 92 per cent. of the inhabitants, Hindi by nearly 5 per cent., and Manipuri by $1\frac{1}{2}$ per cent. Tipura is spoken on the southern frontier, and the various cooly languages have their own adherents. In Table III details are given for the principal languages by subdivisions. According to Dr. Grierson, the language spoken by the inhabitants of Eastern Sylhet is not intelligible to the natives of Central or Northern Bengal.* There are several peculiarities of pronunciation. K has a guttural

* Linguistic Survey of India, Vol. V., Pt. I, p. 224.

sound like the German *ch*., *ch*. is pronounced like *s*, and there is no difference between *ch*. and *chh*. The sibilant, as in the case of Assamese, is often replaced by *h*, and the Sylhetti speaks of *haph* when referring to a snake, and talks of *hakal* instead of *sakal*. But, like a veritable cockney, he is not content with inserting *h*'s where they are not wanted, but frequently omits them when they are. The elephant masquerades as *ati*, and *hatgao*, which really should be *satgao*, is loosely spoken of as *atgao*. The *h* is also reduced almost to the vanishing point in *ghar*, *bhari*, or in verbs like *kahilam*. The Devanagari character is used amongst low caste Muhammadans, especially in the east of the district. They find it easier to master than Bengali, and Bengali books are printed in this character for their benefit.

The caste system of Sylhet is based on the principles in force in Eastern Bengal, a tract of country of which it really forms a part; but as is only natural in a frontier district, social restrictions are to some extent relaxed. Baidyas and Kayasthas intermarry, and Kayastha girls are not unfrequently given to men of lower rank. In these cases, the bride, of course, sinks to the status of her husband, but her parents do not lose their caste on account of the misalliance. The Shahas, who are the great trading caste of Sylhet, and have amassed considerable wealth, occupy a good position in society, though Brahmans will not actually take water from their hands; but even this privilege is accorded to the Das who are the great cultivating caste of the district. This concession is not extended to the Das's priest; and though a Kayastha or Baidya will

take water brought him by a Das, and a high caste Brahman will allow him to enter his cook house, the Das's priest could not offer a cup of water even to a member of the Nabasakh without receiving a severe rebuff. Sylhet and Cachar are, by the way, the only districts in Assam in which the Nabasakh are found, *i.e.*, the functional castes, by tradition nine in number, from whose hands a Brahman can take water. In Sylhet they include the Baniya, Barui, Gandhabanik, Goala, Kamar, Kumhar, Mayara, Napit, Tanti, and Teli. The typical castes of the district hardly call for special mention. They do not differ from those of Eastern Bengal, and are described at length in Mr. Risley's work on the Tribes and Castes of Bengal. Brief notes on all the castes censused in Assam will also be found in the Report on the census of that Province in 1901.

Some reference should, however, be made to the Brahmins on account of their high rank, and to the Sudras who occupy a somewhat peculiar position in Sylhet. The five Brahmins who were imported by the Raja of Tippera in 642 A. D. are said to have been the first members of that caste who settled in the district. The original immigrants were Vaidiks, but representatives of the Rarhi and Barendra septs are also found. They have, however, been so thoroughly fused by intermarriage, that, in practice, there is hardly any difference between these three divisions. Two valid distinctions exist between the Sampradayiks and the non-Sampradayiks, and between the Gaur Gobindi and other Brahmins. The origin of these Gaur Gobindi Brahmins is obscure, and they

endeavour to merge their identity in that of the whole Brahman caste. Gaur Gobind, the last Hindu king of Sylhet, is said to have raised the position of the Maharas and Dases, and general opinion would suggest that the Brahmans who bear his name are indebted to his kind offices for their high position. The most respectable classes of Brahmans are known as Sampradayiks, and do not often marry outside their own community. They are again sub-divided into four local sections: the eastern, who are the most honourable of all and live in the east of the South Sylhet subdivision, the central, southern, and northern. The customs of the Sylhetti Brahmans do not materially differ from those followed in Bengal, which are described at length in Mr. Risley's *Tribes and Castes of Bengal*. They observe the rules of the *gotra*,* and the usual restrictions which encompass a member of the priestly caste from the day of his birth to the day when he is laid upon the funeral pyre. Brahmans are distributed fairly evenly all over the district but are not very numerous in Sunamganj.

The term Sudra is usually applied to the lowest of the four great divisions of Manu, of which the other three are the Brahmans, Kshattriyas, and Vaisyas, but in Sylhet it has acquired a special meaning. Here it is used of the "Deba Das," the low caste people who are known as "Singhas" and "Bhandaris," and act as servants to Brahmans, Kayasthas, and Baidyas. They

* The following are the principal *gotras* in Sylhet: Sandilya, Bharadhwaja, Kasyapa, Savarna, Ghritakausika, Moudgalya, Parasara, Bateya, Basistha, Jamadagnya, Gautama, Agnibeshma, Krishnatreya, Kusika, Kousika, Katyayana, Saktri, Gargya, Atreya, Gargya Maharehi, Swarna-kousika, Jatukarna and Batsa.

are often allowed to occupy their land rent free, and in return for this are bound to render their masters any assistance that may be necessary. Separate figures have not been given for the Sudras in Table IV. as the Halwa Das dislike the prefix Halwa, and, in 1901, many of them described themselves as Sudra Das or even Sudra. Another curious caste are the Rarh or Kusiari. Their second name is said to be derived either from the Kusiara river, or from the sugarcane *kushiyar* which they grow. But neither of these derivations seem appropriate, as they would apply with equal force to thousands of other people. Another tradition says that they are of Tippera or Bodo descent. Kusiari are cultivators by profession, they are looked down on by the Halwa Das, and numerically they are unimportant. The Haijongs, who are found in the Sunamganj subdivision, seem to have originally come from the Garo Hills. They speak a peculiar dialect of their own, and are, apparently, the result of a union between Garos and low caste people of the plains.

The number of persons returned under each of the main castes in 1901 will be found in Table IV, and it only remains to touch briefly on their local distribution. Kayasthas are specially numerous in Habiganj and North Sylhet, and are comparatively scarce in Karimganj. The Das are found in strong force all over the district, but are particularly numerous in Sunamganj, where they form nearly one-third of the total Hindu population ; a proportion about twice as large as that existing in any other subdivision. The Baruis are specially numerous in South Sylhet, where their

pan gardens are to be seen on the banks of the rivers. Habiganj and Sunamganj are the strongholds of the Shahas and Kaibarttas. The latter are hardly found in the three remaining subdivisions, their place being taken by Dom Patnis who are especially numerous in Karimganj. Most of the Manipuris are settled in Karimganj and South Sylhet, though in the latter subdivision they masquerade under the name of Khattris or Kshattriyas. The language test is, under these circumstances, the most reliable, and this shows that in 1901, nearly 29,000 persons were speakers of Manipuri. It is, however, a mistake to suppose that at the present day there is any appreciable immigration from Manipur. This movement westward took place some years ago. Each succeeding census shows a large decrease in the number of persons born in Manipur and censused in Sylhet, and in 1901 there were only 89.* These Manipuris are a factor with whom the district officer has to reckon. The history of their own State is one of perpetual conflict; wars and rumours of wars, risings and rebellions, usurpers seizing the throne and being in their turns assailed by other usurpers. The Manipuris are by nature a turbulent and unruly people, and have little respect for the majesty of the law. In 1857, it was thought that possibly they might give trouble, and recently at Bhanubil they have evinced a tendency to defy not only their own landlord but the representatives of Government itself. They are also suspected of having an inclination for dacoity and other violent forms of crime.

* The corresponding figures for 1881 were 3,253 and for 1891, 336.

The abstract in the margin gives some idea of the ethnical composition of the people. The Muhammadans describe themselves as Sheikhs, but the great majority are no doubt descended from the aboriginal inhabitants of the Surma Valley, and must have been largely recruited from the humble Hindu castes, who themselves were very probably of Bodo origin. Both the Naba-

sakh and the lower functional castes have to a great extent abandoned their traditional occupations for agriculture. The fishing castes are very strongly represented, but this is only natural in so watery a district. The bulk of the undistributed nine per cent. are foreigners of various humble castes employed on tea gardens.

Classified by religion, the population of Sylhet in 1901 was distributed in the following proportions : Muhammadans 52·7 per cent., Hindus 46·8 per cent., Animists 0·5 per cent. The abstract in the margin shows the percentage of the population in each subdivision who profess the faith of Islam. As is only natural, Muhammadans are most numerous in North Sylhet, which was the first portion of the district to come into their possession, and on the western frontier which adjoins Bengal. South Sylhet and Karimganj came less under the influence of the Moslem faith, and for

the faith of Islam. As is only natural, Muhammadans are most numerous in North Sylhet, which was the first portion of the district to come into their possession, and on the western frontier which adjoins Bengal. South Sylhet and Karimganj came less under the influence of the Moslem faith, and for

many years were probably dominated to some extent by the Hindu Kingdom of Tippera.

During the last decade the increase amongst the Muhammadans amounted to 5 per cent, though the natural growth of the population was less than 2 per cent. This is the more remarkable in that nowhere are the Muhammadans more numerous than in North Sylhet, a subdivision in which the last census disclosed a serious decrease in the population. Four Musalman gentlemen, who were consulted by the Deputy Commissioner, were all of opinion that conversion had very little to do with the growth of the Muhammadan population. There is no organised propaganda of the faith, and the few converts made are said to be Hindus of low-caste, who have been detected in intrigues with Muhammadans of the opposite sex. The higher rate of increase amongst the Musalmans is ascribed to superior fecundity, which is said to be due to greater physical vigour and a more nourishing dietary, to the absence of restrictions on widow remarriage, to a less marked disparity between the ages of husband and wife, and, to some extent, to the greater prevalence of polygamy. The absence of restrictions on widow remarriage is probably the most important factor. In 1901, there were only 31,000 Muhammadan widows between 15 and 40, as compared with 60,000 Hindu widows of this age, and the Musalmans had about 30,000 more potential mothers, *i. e.*, married women between 15 and 40, than the followers of the rival religion. A difference such as this is bound to produce a sensible effect on the growth of the population.

The town of Sylhet is full of memorials of its Muhammadan conquerors. On every side are to be seen mosques, the majority of which are still in excellent repair, and are attended by a concourse of devout worshippers. But, even more numerous than the mosques, are the large brick tombs of the Muhammadan saints, each with a little masonry receptacle for a native lamp, or else with a bamboo lamp post of the most modern pattern, standing at its side. These tombs are to be seen in every quarter of the town. There is hardly a road which has not one or more along it, hardly a hill which has not the bones of saints upon its summit. The religious centre of Sylhet is the shrine of the famous Shah Jalal. It is situated about a mile north of the cutcherry, some three or four hundred yards west of the road that leads to Companyganj. At the point where the main and branch roads meet are the masonry walls of an old mosque, begun some two and a half centuries ago, but still unfinished. The builder was dilatory, the work was not completed within the stated time, and, as a punishment for his neglect, the Nawab of that day had him summarily put to death. The building is now almost completely hidden by the trees that have succeeded in effecting a lodgment in its walls, but, though the roof was never finished, the massive outer walls suffered little or no damage in the great earthquake of 1897.

Shah Jalal's mosque, which was built in 1531 A. D., is approached through a gateway of solid masonry, much of which was shaken down in 1897, and now lies in huge blocks in picturesque confusion on the ground. On the

left hand side as you enter is a tank with a ruined mosque in front. On the right is an open shed, in which food is cooked for the worshippers on holy days, one huge cauldron alone containing as much as six and a half hundred-weight of rice. The building is approached by a flight of steps which terminates in a broad platform. In front is a central hall through which the worshipper passes to the actual tomb. Here there is a small place of prayer, which, together with the gateway, is said to have been erected by Mr. John Willes, one of the earliest of the Collectors of Sylhet. South of the central hall is the mosque in which prayers are usually held, while at the back is a deep well full of fish who come when called to be fed. A grant of Rs. 93 per mensem, which was sanctioned by the Nawabs for the maintenance of this institution, has been confirmed by the British Government. Another famous mosque is situated near the south-west corner of the Jail compound, and was founded by Shah Abu Turab in 1698 A. D.

Masonry mosques are common even in the villages of North Sylhet, but, where the villagers cannot afford this luxury, service is often held in a small thatched hut. Near the Shahji Bazar railway station, in the south-west corner of the district, is the *darga* of Shah Fateh Ghazi, one of the companions of Shah Jalal. This *darga* is maintained from the rents received from a village which was granted to it by the Mughal Government, and has since been exempted from payment of land revenue, and a *mela* has for many years been held in the vicinity about the middle of January. In this same thana of Madhabpur there are the *dargas* of other famous Muhammadan saints,

i.e., of Shah Ahmed Ghazi at Fathepur, of Shah Ghyas Saheb at Charabhanga in pargana Ghyasnagar, of Shah Aulia in pargana Kasimnagar, of Shah Ali and Shah Ghazi near Kasimpur, and of the Panch Pirs at Alabakshpur. In Dhargam pargana, in Jaintia, there is the tomb of a great fakir called Patashah, at which offerings are made by those who are anxious to be cured of some disease or to be blessed with children. In the Pratapgarh pargana, to the south of Karimganj, there are several *mukams* which are said to have been founded by one of the Badshas of Delhi, who turned fakir and settled in that lonely spot. Timber traders, whether Muhammadan or Hindu, still worship at these places, and it is said that tigers in former days used to visit these shrines on Thursday nights, and eat any food left for them, without molesting the persons stopping in the *mukam*. Thursdays are still observed as holy days by the lumber men in these hills, and timber is neither felled nor dragged on that day of the week. Nearly all the Muhammadans of Sylhet are Sunnis, but there is one important family, that of Moulavi Ali Amjad Khan, which professes the Shiah creed.

Hinduism is divided into three main sects, Saktism, Sivaitism, and Vaishnavism. At the census of 1901 nearly 30 per cent. of the Hindus returned themselves as Saktists, $5\frac{1}{2}$ per cent. as worshippers of Siva, $53\frac{1}{2}$ per cent. as Vaishnavites, and 11 per cent. failed to specify the particular form of that religion to which they owed allegiance. Saktists worship the reproductive powers of nature as manifested in the female, and Sivaites the male emblem of fertility. The

latter adore Siva, the former his wife Sakti. The Vaishnavites represent a revolt against the haughty pretensions of the Brahmans and the degrading rites of the Tantric worship. Little attention is paid to caste restrictions, the use of animal food and wine is deprecated, and the slaughter of animals in sacrifice forbidden. Krishna is the particular manifestation of the deity selected for special reverence, and *sankirtan*, or music and songs, is declared to be the most suitable form of worship. The family home of Chaitanya, the great Vaishnavite reformer, who was born in 1484 A.D., was situated at Dhakadakshin, about ten miles south-east of Sylhet town, and most of his followers regard him as the latest incarnation of Vishnu.

A somewhat curious sect is that which is known as the Shahaj or Kishori Bhojan. It was founded by one Kalachand Vidy-
The Shahaj Bhojan. alanker of the Bikrampur pargana in Dacca, and salvation is said to be obtained by imitating the amorous actions of Krishna at Brindaban. Each devotee has one or more female associates with whom, according to most accounts, he indulges, or endeavours to indulge, in very curious practices. The members of this sect are said to assemble secretly at night and to worship the mistress of their priest, who is supposed to represent Radha, the wife of Krishna. Food is offered to her, and, after she has taken a little, the *prasada*, or leavings, are distributed amongst the congregation. Songs are sung, ganja is consumed, and a good deal of sexual intercourse is supposed to take place. The female worshippers are

generally young widows, and most of the members of this sect are persons of low caste.

There are few masonry temples in Sylhet, and religious buildings usually take the form of *akhra*s for the Vaishnavites, and Kali or Durga *baris* for the worshippers of Sakti. **Sacred places in Sylhet.** An *akhra* is a religious institution inhabited by Vaishnavite devotees, who are supported by the contributions of their immediate disciples or of devout Hindus in general. There is little of dignity either in the demeanour of the inmates or in the appearance of the buildings in which they dwell. In many of these institutions there are women as well as men, and it would hardly be too much to say that under the specious cloak of religion a large proportion of the devotees live a life of sloth and sensual indulgence. The *akhra*s of Sylhet and Bithangal are described below, but these are two of the finest specimens of their kind, and the ordinary *akhra* is a place of much less interest and importance. In the Kali or Durga *bari* too, no less than in the *akhra*, Hinduism suffers, as it so often does, from the mean and unworthy form in which it is presented to the world. The emotions roused by a contemplation of the image of the goddess are hardly those of reverence or awe, and the building in which it is housed is generally a sorry shanty whose roof of hideous corrugated iron is supported on wooden posts. The unprejudiced observer in Sylhet can hardly fail to be impressed by the extraordinary difference between the outward manifestations of the Muhammadan and Hindu faith. In the one case there is simplicity, severity, cleanliness, and dignity. In the

other there is only too often nothing but grotesqueness, meanness, and squalor, and it is difficult to realize that its adherents include the most advanced and intelligent sections of the population.

The places which are most sacred in Saktist eyes are Phaljor in pargana Bhaurbhag in Jaintia, where there is a stone pillar which is said to be Sati's left leg, and Jainpur, about a mile and half south of Sylhet town, where her neck is said to have fallen when her body was dismembered by Vishnu. The latter *pith*, as the places consecrated by the fragments of Sati's severed body are called, has only recently been rediscovered. Sati's neck is represented by a piece of flat rock, similar to that found on most of the tilas round Sylhet. Her *bhairabi*, or guardian left to protect her by Siva, takes the usual form of a small upright pillar of rock shaped like a phallus. There is no temple over these remains, and hardly anything to distinguish them from many similar pieces of stone found in the neighbourhood of Sylhet town. At Barakia and at Chandipur, a village near Dwara Bazar in the Chhatak thana, there are shrines of Chandi, another incarnation of Sakti, which are visited by pilgrims on the Ram Navami day.

The following places are considered by the Sivaites to be particularly sacred: (1) Nirmai in the South Sylhet subdivision, where there is an image of Siva, before which people sometimes shave their hair in the hope of being delivered from disease. (2) Siddheswar's temple

at Badarpur, a few yards beyond the boundary of the district. (3) Rupnath in the Jaintia Hills about a mile and a half beyond the district boundary, and (4) Sarbananda about a mile and a half south of Sylhet town. The last two places are said to be the *bhairabis* of the neighbouring *piths*. Fairs are held at each of these shrines on the occasion of the Sivaratri festival. Large *lingams*, or stone pillars intended to represent the phallus, are situated three miles south of Jaintiapur; at Hatakeswar on the left bank of the Surma in the Karimganj subdivision where it is said to have been worshipped by Gaur Gobind, the last Raja of Sylhet; and at Tungeswar in the Habiganj subdivision.

The places which are held by the Vaishnavites in most respect are the temple of Chaitanya **Vaishnavite akhras.** at Dhakadakshin or Thakurbari, and the temple at Supatala in Panchakhanda. At the latter place there is a stone image of Vishnu, which has a considerable local reputation. There is another image of Vishnu in the Jagannathpur village, in the south-east corner of the Sunamganj subdivision. It is said to have been made by Viswakarma, the god of artificers himself, in the time of the Mughal Emperor Shah Jahan, and on this account is visited by pilgrims from every part of the district. At Bithangal near the Mymensingh boundary there is an *akhra* under the management of the Jagan-mohani sect. At one time there was neither idol nor *tulsi* plant at this *akhra*, and cowdung was not used for cleansing purposes. Strong objection was, however, taken at Brindaban to this disregard of what the ordinary Hindu holds sacred, and a more orthodox ritual is now observed.

Ram Krishna, the founder of this place, is held in the greatest veneration, and offerings are made at his shrine by men who desire offspring or the increase of their herds. This section of the Vaishnavites at one time tried to worship an abstract god without shape or form, but this proved to be beyond the spiritual capacities of their disciples, and they sing the praises of Hari, Krishna, Rama and even Chaitanya. Bithangal has completely eclipsed the *akhra* at Masulia near Habiganj, which contains the tomb of Jaganmohan, the founder of the sect. It is the wealthiest and most prosperous *akhra* in Sylhet, and is said to receive as much Rs. 40,000 per annum in the form of offerings from its disciples. The buildings are of considerable size, and are of masonry, and several of the rooms are paved with marble.

Other famous *akhra*s are situated at Jugaltila in Sylhet, where the mahunta is invariably a Brahman ; at Panisail in the Indeswar pargana in South Sylhet ; and at Nayagaon in Sunamganj. The last named *akhra* has recently been started in honour of Adwaita, one of Chaitanya's followers, who is said to have been an incarnation of Siva. The *akhra* of Jugaltila is said to have been founded some 200 years ago by one Jugal Kiscra mahunta, who is supposed to have been an incarnation of the deity. It is endowed with landed property which brings in from one thousand to fifteen hundred rupees a year, and has some seven or eight hundred disciples, each of whom contributes on the average about As. 12 per mensem towards its maintenance. It is situated on a low hill, approached by a flight of masonry steps, and the idol is placed in an open shed

consisting of a corrugated iron roof supported on wooden posts. There are quarters for some thirty resident disciples, but all of the buildings are mean and squalid, and the place is in no way comparable with the more important *sattras* in Assam.

There are other places revered by all Hindus alike, irrespective of their sect. A certain **Other sacred places.** portion of the Panatirtha river, near the village Ghagtia becomes as sacred as the Ganges on the occasion of the Baruni, and pilgrims flock in numbers to bathe in the holy waters. In the south-west corner of the Habiganj subdivision, there is a temple at Krishnapur, at which pilgrims worship after they have bathed in the sacred pool of Brahmakunda, which is situated just across the boundary of Hill Tippera. Another sacred pool is known as Tamptakunda and is situated in pargana Panchbhag in Jaintia. This pool is said to become quite warm on the occasion of the Baruni, and it is possible that the water has in reality some mineral properties. Special sanctity is also said to attach to the place where the Manu and the Kusiara meet. The absence of any Hindu temples of importance is quite intelligible. Sylhet came under the influence of the Muhammadans at an early date, and, prior to its conquest, there were no local notables of sufficient wealth and power, to erect masonry buildings of any size or permanence. The country seems to have been split up into a number of petty principalities, and these small lordlings of a jungly frontier tract had not the means, even if they had the inclination, of raising temples to the glorification of god's name and the commemoration of

their own. The statement appended to this chapter shows in a consolidated form the various sacred places in the district. Some of these shrines are surmounted by a brick built temple, but in many cases the deity is hidden in a rough unhewn piece of stone, protected from the sun and rain by a miserable hut of bamboo and thatch.

The statement in the margin shows the number of persons returned under the different religions which had a comparatively small number of adherents in the district in 1901. The animistic tribes are found at the foot of the hills along the northern and southern boundary, and are Khasis and Garos in the north, and Tipperas in the south. A considerable proportion of the followers of this religion were, however, jungly coolies, Oraons, Santals, and people of that class. The Jains are the Marwari merchants from Rajputana, and the Brahmos are recruited from the ranks of the more thoughtful and educated amongst the Hindus, and are not unnaturally found living in the towns.

Minor Religions.			
Animists	::	::	11,337
Jains	::	::	141
Brahmos	::	::	47
Buddhists	::	::	7

The total number of Christians (744) is small, and the number of native Christians (394) smaller still. Sylhet is too civilized to allow of conversion proceeding rapidly, and in the twenty years ending with 1901 the number of native Christians only increased by 130. Members of the Welsh Mission are stationed at Sylhet, Maulavi Bazar, and Karimganj, but they have only met with a small measure of success, and in 1901 they had but 80 followers. This is

Christianity.

not due to any personal hostility towards the preachers of the gospel. A well-known missionary, the Reverend Mr. Pryse, was universally esteemed, and, on his death, the Hindus of the town defrayed the cost of the erection of his tombstone, and founded a library to commemorate his name. On social grounds there are, however, the strongest objections to a change of faith. The neophyte, whether he embraces Christianity or Muhammadanism, has to abjure too much, and there are at present no signs of any general movement towards the adoption of the western creed. The native Christians are distributed fairly impartially over most of the principal sects. In 1901, there were 52 Anglicans, 48 Baptists, 85 members of minor denominations, most of whom failed to specify their sect, and 126 Roman Catholics.

The bulk of the Roman Catholic community live at the village of Bandasil, on the left bank of the Barak, a mile below Badarpur. Their forefathers are said to have been settled there at the beginning of the 18th century by a Muhammadan Nawab, who came from Meerut with a party of Musalmans and Native Christians; the latter, according to the village traditions, being employed to serve his guns. Where the Nawab recruited these men history does not relate, but they are said to have built a fort in Bandasil and to have settled round it. After the Burmese war the Nawab was rewarded for his loyalty by a grant of land in Baniyachung, the proceeds of which enabled the Roman Catholics of Bandasil to live in idleness. Quarrels broke out in the small community, their land was gradually sold to the surrounding villagers, and most of the people now earn their living by domestic

service. Since 1891, there has been a resident Roman Catholic priest at Bandasil.

Sylhet like the rest of Assam is a rural area, but the percentage of the population supported by agriculture (81·5), though high, is lower than in any other district in the plains except Kamrup. The explanation lies in the fact that occupation is somewhat more specialized than in Assam. The functional castes exist, and to some extent follow their traditional occupations, and the spiritual needs of the people have ample provision made for them. The

Occupation.

Number of persons to each, Sylhet. Darrang.			
Barber	...	...	769 3,666
Washerman	...	...	789 2,666
Priest	...	...	227 1,629

statement in the margin shows the number of persons in the district for each person actually employed as a barber, washerman, or priest in Sylhet, and in Darrang which is a purely rural district. The number of priests is particularly large in Habiganj, and, with real discretion, they avoid the marshy country lying to the north of this subdivision. The fishing industry is of considerable importance in the flooded tracts to the west, where a trade is carried on in cured as well as in dried fish. In North Sylhet the fishermen are not so numerous, and they are comparatively scarce in South Sylhet and Karimganj, where the level of the country rises, and the area of submerged land is not so large. The greater portion of Sylhet is permanently settled, but settlement was made direct with the actual cultivators, and the number of estates is unusually large. According to the census returns, which have, however, in a matter of this kind to be accepted with a certain degree of caution, nearly one-third of the

total agricultural population were cultivating their own land. In North Sylhet, the number of persons holding direct from Government was almost equal to the number of tenants, but the subdivision includes the Jaintia Parganas which are temporarily settled. In Karimganj also, the number of landholders is about two-thirds of that of the tenants, but in the three remaining subdivisions the tenants are in a very large majority. The only occupations in addition to those mentioned, which in 1901 supported more than one per cent. of the total population, were garden labour, general labour, and begging. Women do not, as a rule, work in the fields in Sylhet, and the proportion of actual workers is thus considerably lower than in Assam proper. In 1901, the workers only formed 38 per cent. of the whole, as compared with 67 per cent. in a district like Lakhimpur. Further details with regard to the occupations of the people will be found in Table IV.

The wealthiest family of Sylhet is that of Maulavi Ali Amjad Khan of Langla. The **Leading families.** founder of the family was one Maulavi Muhammad Rabi, who was tutor to the sons of the Nawab of Murshidabad, and in 1735 A.D. received as a reward a large *jaghir* of land near his house at Langla. His son Maulavi Muhammad Ali Khan was appointed Kazi of Sylhet in 1773 A.D., and his estates were assessed to revenue in 1819 A.D. He was succeeded by his son Gous Ali Khan, who was accused of having supplied rations to the mutineers in 1857, but was acquitted of the charge, and was the grandfather of the present zamindar.

One of the most respected, though not one of the wealthiest families in Sylhet, are the **The Mauzumdar family.** Mauzumdars. The founder of the family was Surwar Khan, who, in 1464 A.D., reduced to order the revolting Zamindars of Ita and Pratapgarh. His son, Mir Khan, was appointed Kanungo of Sylhet, and this office remained in the family till it was finally abolished at the time of the permanent settlement. Several places in the district take their names from different members of this family. Thus Jahanpur is called after Jahan, son of Lodi Khan, who subdued Khoja Osman Khan, the zamindar of Bhanugach. Keshwar Khan, who held office in the time of Aurangzeb, dug a canal which is still called Keshwar Khal, and Mahtab Khan, his son, founded a bazar which bears his name. The present representative of the family, Khan Majid Bakht Bahadur, was for some time a Deputy Magistrate in Bengal and an Extra Assistant Commissioner in Assam. His father Saiyed Bakht resided for several years in Mecca, and was made a member of the Sherif's Council and decorated with the Star of the Mejidhi. Both he and his son, Hamid Bakht, were exempted from attendance in the civil courts, a privilege which is at the present moment (1904) accorded to only one individual in the Province, the gosain of the Dakhinpat, *sattr*a in Sibsagar.

The Dastidars are said to be descended from the same stock as the Mauzumdars, though **The Dastidars.** the latter family were converted to the faith of Islam in the 15th century, while the Dastidars have remained faithful to the Hinduism of their forefathers.

The founder of the family, Kabiballabh, was appointed Dastidar of Sylhet, and in that capacity had charge of the royal seal. Hare Krishna, who in 1722 was appointed Amil of Sylhet, is perhaps the best known member of the family, which at the present day has lost most of its former wealth.

The Dewan family was founded by a native of the Hooghli district, who settled in Sylhet in the middle of the 16th century.

One of his descendants, named Manik Chandra, was appointed Dewan, and his son, Murari Chand, was, in his time, one of the most conspicuous figures in the society of the district. The present head of the family, Raja Giris Chandra Roy, is the grandson of this gentleman, and has established a college in the town in honour of his memory. In 1898, the title of Raja was conferred upon him, but his estate has been considerably reduced by his numerous benevolences and generous and hospitable style of living. There is another Dewan family at Baniyachung descended from the Gobind Singh referred to in the second chapter (p. 25.)

The great bulk of the Hindus marry in the orthodox way, by what is known as the *prajapatya* form, which corresponds to the *hompura* of the Assam Valley. The ordinary marriage ceremony is much as follows, but the style in which it is carried out depends upon the resources of the contracting parties.

The first thing to be done after a match has been agreed upon is to fix the date for the ceremony. The bridegroom's representatives proceed to the house of the

bride with fish, sweetmeats, curds, and betelnuts, and, on their arrival, the Brahmans of the village are summoned and asked to select an auspicious day. The next stage is known as Panakhili, and consists of the offering of betelnuts and leaves, with two small pieces of gold and silver, to the family idol, or to the idol of a neighbour, if neither of the families possesses an idol of its own. Two nights before the wedding day the bridegroom and the bride are solemnly bathed, and on the following morning the general merry-making begins. A party of drummers is called in, who, with short intervals of rest, keep up their unmelodious music day and night; the children of the two families are decked out in their best; the bride and the groom are solemnly bathed; and friends and relatives assemble from all sides. At night a theatrical performance is given in the bridegroom's house, and a party is despatched to fetch the bride, for in the Surma Valley the actual ceremony generally takes place in the house of the groom. On this night, also, the contracting parties are once more solemnly bathed. Early the next morning a priest sprinkles water over them from a mango leaf, and places a daub of an oleaginous black ointment, called *adibash*, upon their foreheads. During the day the bridegroom, and some male relatives on behalf of the bride, offer oblations to the spirits of their ancestors, and a feast is given to the Brahmans and the assembled guests. In the evening, the contracting parties are again solemnly bathed and attired in their best clothes, and, pending the advent of the bride, who arrives in the middle of the night attended by most unmusical musicians, the groom is allowed to witness the theatrical performance that is going on.

When the time for the actual ceremony has come, he is anointed with sandalwood, a crown of pith and flowers is placed upon his head, and he is escorted to the front of the main house, where a maid or married woman presents him with a ring, a pair of cloths, and some curds. Both parties then enter a small enclosure in the courtyard which has been fenced in with split bamboos and plantain trees, the groom is seated on a stool, and the bride marches round him seven times, throwing flowers and red powder over him as she completes each circuit. The next stage is called *sampradan*, and is the really binding part of the ceremony, when the girl and her dowry are formally handed over to her husband. A fire is then lighted, flowers, rice, and *ghi* are thrown upon it, and the priest utters the appropriate *mantras*. By this time the young pair are thoroughly worn out, and gladly avail themselves of the permission to seek what rest they can for the remainder of the night. On the following day they are again solemnly bathed, and are conducted round four bamboos in the courtyard, and a feast is given to the assembled guests. This ceremony is repeated on the fourth day, as on the intervening day the bride and groom are not allowed to see one another, and the marriage is then said to be complete.

Except among the higher ranks of Hindu society, it is the general practice in Sylhet for a man to purchase his wife. The usual price amongst the lower castes ranges from Rs. 40 to Rs. 50, though a girl can sometimes be obtained for a ten rupee note, a price which could not be thought excessive by even the poorest cultivator. Shahas, on

Cost of the
Ceremony.

the other hand, when marrying into a good family, have been known to salve the conscience of the father by the gift of as much as fifty times that sum. That, after all, is not too much for a wealthy parvenu to pay for the privilege of being allowed to call a respectable Kayastha father-in-law. The other expenses incidental to a marriage are incurred on Brahmins, who expect their customary fee, on musicians, palki-bearers, and other hangers on, and on fireworks, clothes, presents, and quantities of food. On this an ordinary cultivator will expend some Rs. 30 or 40, but a rich man's wedding may cost anything up to Rs. 1,000. Widow re-marriage is regarded with growing disfavour, even amongst the lowest castes, with the natural result that there is an increasing difficulty in obtaining wives. Even if every Hindu woman were pressed into the service, some thousands of men would still remain unwed. Under these circumstances it seems a lamentable waste of good material to leave some 60,000 Hindu widows, none younger than fifteen and none as much as forty, to lead a depressing life of dreary solitude. In the Habiganj subdivision, the Bengal custom of paying for the bridegroom is gradually gaining ground amongst the upper classes, and the father of the girl is expected, not only to defray the expenses of the wedding, but to pay for the education of his son-in-law as well.

Amongst the Tipperas the familiar form of marriage by service is in vogue, and the man is expected to live some time in the house of his father-in-law and work for him in his *jhums*. The only trace of this custom amongst the Hindus of Sylhet, who differ in this particular from the

Assamese, is to be found in the *ghor jamai*, who is permanently absorbed into the family of his father-in-law. The Manipuris, like the Assamese, sometimes evade the demands of a too avaricious parent by the simple process of carrying off the girl, who offers only a nominal resistance to her abduction. Having obtained possession of her person it is a comparatively easy matter to come to terms, and no social obloquy attaches to the young couple.

As far as the feasting and general merry-making is concerned the Muhammadan marriage does not differ materially from the Hindu, but it has, of course, no religious side. The essential parts are the formal assent to the contract given by the bridegroom and the bride, and the execution of the *kabin*.

The following are the principal festivals of the Hindus :—

The Saraswati puja is held in January or February.

Hindu festivals.

A clay image of the Goddess of Learning is procured, offerings of flower, leaves, and eatables are made to it, and the worshippers abstain from book and pen. This puja is usually confined to the higher classes of society. The Suryapuja is held in the month of Magh (middle of January, to the middle of February) in honor of the Sun God. A plantain tree is set up in the courtyard and decorated with flowers, and offerings of leaves, eatables, and flowers are made, the women singing all the while in honor of the Sun God. In February or March comes the Sivarati, during which the worshippers fast during the day and sit up at night to worship Siva's lingam and eat bhang and ganja.

About a fortnight later there is the Doljatra. On this occasion the image of Vishnu is worshipped, anointed with red powder, and then swung to and fro, while the people pelt one another with red powder in memory of the amorous contests of Krishna with the milkmaids of Brindaban. Towards the end of March there is the Barunisnan, when ablutions are offered to the spirit of the departed ancestors, and the villagers feast on curds, parched grain, and molasses. The Rath Jatra takes place in June or July, when an image of Vishnu or Jagannath is dragged about on a car. On the last day of Sraban (middle of August) there is the Bishahari or Manasa puja in honour of the goddess of snakes. This puja is very popular in Sylhet, and is observed by all Hindus, high and low, rich and poor alike. Flowers, leaves, and eatables are offered to a clay image of the goddess, and goats, ducks, and pigeons are sacrificed. A few days later the Vaishnavite section of the community, and more specially the Vaishnavite ascetics, or Bairagis as they are called, celebrate the Jhulan festival. Images of Krishna and Radhika are worshipped and swung to and fro. There is much singing on this occasion at night. In the same month, or in the month following, there is the Janmastami in honour of the birth of Krishna. The main feature of this festival, which is observed by every devout Hindu, is abstinence from food and drink. In September or October there is the Durga puja which is a time for general merry-making. New clothes are given to the children, members of the family who are away return home, and there is general feasting and jollification.

The rich purchase clay images of Durga, Lakshmi, Saraswati, Kartik and Ganesh. Poorer people make their offerings to plantain trees or earthen jars filled with water. The puja lasts for four days. Goats are usually sacrificed on each of the first three days and on the third day those who can afford to do so kill a buffalo. On the last day the goddess is worshipped with flowers, leaves, and eatables and then thrown into water amidst singing and beating of cymbals.

Four days after the Durga puja comes the Lakshmi puja, and in the last quarter of the year there are the Kali, Kartik, Jagadhatri and Rash pujas. The last named festival is only observed by the Vaishnavites and is especially popular with the Manipuris.

A special form of religious ceremony is known as the *noaka*, or boat puja, and is performed by a wealthy man in satisfaction of a vow, who generally spends from Rs. 300 to Rs. 500 on the ceremony. A shed is built, at the end of which is a boat painted and gilt, from which rise, tier upon tier, the images of various gods, amongst whom Bishahari is generally the most prominent. For several days sacrifices are offered to the deities, and Brahmans, who are well paid and feasted for their services, offer up their prayers. At the end of this time the house and its contents are abandoned and allowed to fall to pieces. Every Hindu has a *guru*, or religious teacher, to whom he makes an annual offering varying from 2 annas to 5 rupees according to his means.

The Pous or Uttarayan Sankranti, held about the middle of January, has no religious associations and corre-

sponds to the Magh *bihu* of the Assam valley. The villagers light bonfires in the rice fields, at which they warm themselves after the morning bath, and devote the day to merry-making.

In the north and west of the district, where, in the rains, much of the country goes completely under water, boat races are a source of great amusement. The *khel naos*, as they are called, are long narrow canoes, with a peaked stern and prow, which are carved, and painted with the brightest colours. They often carry a crew of forty men, who sit in pairs and paddle with the utmost vigour, while a corybantic individual dances in the centre of the boat, and shrieks out a weird song to the accompaniment of a pair of clashing cymbals. The course is generally a fairly short one, but, as soon as one race is decided, the boat-men paddle slowly back to the starting point, and at once set off again upon their wild career, and the process is repeated time after time till all the competitors are thoroughly exhausted.

Tigers are found near the foot of the Khasi Hills and are netted by the villagers. Directly a kill takes place the tiger is followed by the bravest and most expert shikari and is marked down to his lair. The villagers then turn out armed with spears, daos, and guns, and keep up a terrific din till the place has been surrounded by a strong net fastened to bamboo posts. The space enclosed is generally covered with jungle, in which the unfortunate animal lies hidden, but a heavy log with ropes attached is slipped underneath the net, and dragged

backwards and forwards till the grass is beaten down. Furious at this disturbance the tiger charges the net, but it is driven back with spears and sharp bamboos. As time goes on the animal becomes exhausted from weariness and thirst. A split bamboo is then thrust through the net, and water is poured down it into the huge beast's mouth to revive its flagging energies. During the night, large fires are lighted all around the net, and the people amuse themselves with songs and music. The tiger is sometimes teased and worried for a week or more and no one is allowed to attempt to kill it, till a majority of the whole crowd assembled have decided that the proper time has come. The first shot is then offered to the man of highest rank who happens to be present. Heavy fines are imposed by the village community on any persons who fail to attend on receiving information of the kill, who leave their posts before they are relieved, or who break any of the other rules laid down by the community. In the same portion of the district wild pigs are shot, and, sometimes, speared by men mounted on tame buffaloes. The pig does not notice the man on the buffalo's back, and he is thus enabled to approach sufficiently near to deal a blow which generally proves fatal. Occasionally, also, pigs are speared from trees, but this form of hunting is only crowned with success when the animal breaks cover in exactly the desired direction. In the Sunamganj subdivision, the villagers often race their ponies in the *haors*, the Pous Sankranti being the season of the year which is specially set apart for these local Derbys. Boys and young men play cricket and football, and native games akin to prisoner's base and tip-cheese. Song and music, of course, are popular, and theatrical

performances are given at weddings and on feast days. A special form of dance is known as the *ghatu's* nautch. The *ghatu* is a young Nat boy who is hired by the villagers, often at a considerable salary, to dance to them in the evening. This form of amusement is very popular, but it is doubtful whether it has a very elevating effect upon the moral character of the people, as the *ghatu* is generally treated as a pet by the younger members of the community.

List of Temples.

Place or pargana in which situated.	Name of temple.	Name of founder and date of foundation.	Special god to whom the temple is sacred.	Brief description of building.
Dhakadakehin—Village Dattarail.	Mahaprabhu ...	NORTH SYLHET. Jagannath Misra and others of his family, about 1700 A. D.	Chaitanya and Nityananda.	The masonry building was destroyed by the earthquake of 1897. The idol is now in a <i>cukka</i> house.
Nijpat—Jaintiapuri Raj.	Jaintesvari ...	Not known ...	Kali.	
Do.	Siva Mandir ...	Do. ...	Siva	Masonry.
Sylhet town	Sridurgabari ...	Lala Gour Hari Singh, about 1780 A. D.	Sridurga	Corrugated iron roof and masonry walls.
Do. (Kaligbat)	Kalibari ...	Lala Har Chandra Singh, about 1800 A. D.	Kali	Do. do.
Do. (Lamabazar).	Dasnami ...	About 1750 A. D.	Kalbhairab	Masonry.
Mandalibogh, pargana Chhatak.	Kalibari ...	SUNAMGANJ. Hindu zamindars of Baniyachung, about 1300 A. D.	Kali	Do.

Unlike the temples and *sattras* in the Assam Valley, these places have not been endowed by the pious founder with a grant of land. Most of them own the actual sites on which they stand, but beyond this nothing more, and the largest estate is only about 400 acres which is held by the Patharis Akhra in Sunamganj.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Agriculture—Rice—Mustard and Pulse—Linseed and Til—Sugarcane—Jute—Cotton—Garden Crops—Agricultural Implements—Storage and Threshing of Grain—Causes affecting productiveness of land—Yield and Value of Crops—General Remarks—Live Stock—Floods—Development of Tea Industry—Labourers employed—Soil required—Varieties of Plant—System of Cultivation and Manufacture—Green Tea—Outturn and Prices—Forests.

The principal crops grown in the district are rice, which is the staple food grain, tea, **Agriculture.** mustard, pulse, linseed, sesamum or til, sugar cane, jute and cotton ; but, as the greater part of Sylhet is permanently settled and has not been cadastrally surveyed, there are no reliable data to show the area planted out with each of these different staples. In this, as in other matters, the historian of Sylhet labours under special difficulties, due to Mr. Willes' decennial settlement. It is impossible to trace the extension of cultivation, it is impossible to say, even at the present day, what proportion of the district is under crop, what proportion fallow, and what proportion waste, it is impossible to mark the rise or fall of any staple in the estimation of the peasants. Offensive though this doubtless is to the precise mind of the statistician, it is doubtful whether the practical loss is in reality very great. Although we cannot express the fact in percentages worked out to several places of decimals, we still can feel assured that Sylhet is densely peopled, that the proportion of good waste land available for cultivation is very small, and that during the last century there was

a great extension of the area under the plough. We know that the staple food grain is rice, that in normal years the district produces much more than it can possibly consume,* and that the chance of anything even approaching scarcity is very small. The direct intervention of Government is so seldom necessary, that we can acquiesce, with some show of grace, in general knowledge, as distinguished from the particular information available for other districts. In the following paragraphs some account is given of the system followed for the cultivation of the various crops.

Rice, as has already been said, is the staple food crop, and probably covers two million acres of land. It falls into four main divisions, *sail*, which is transplanted on higher land, and *aman*, which is sown broadcast or transplanted on lower land, and, like *sail*, is reaped in winter; and *aus* and *boro*, both of which belong to the category of summer rice.

Sail is first sown broadcast in little beds or nurseries. The land is broken up in April or May, is ploughed five or six times till it is reduced to a fine puddle of mud, and is not unfrequently manured with cowdung and sweepings. The size of the nursery varies with the area to be planted out, but generally stands to the rice fields in

* In 1850 Dr. Hooker wrote as follows: "The Silchar rice is of admirable quality, and much is imported to Sylhet, the jheels not producing grain enough for the consumption of the people. Though Silchar grows enough for ten times its population, there was actually a famine six weeks before our arrival, the demand from Sylhet being so great."—Himalayan Journals, Vol. II., p. 319. Sylhet has always been in normal years a great rice exporting district, and it is difficult to believe that it at any time drew its food supplies from Cachar. At the present day of course rice goes from Sylhet to Cachar.

the proportion of from 1 to 14 to 1 to 18. The seed, which has been selected from the largest ears of the previous year's crop, is sown broadcast over the bed, and at the beginning of summer these patches of the brightest green herbage are a striking feature in the rural landscape. In the meanwhile the fields are being got ready for the reception of the seedlings. The husbandman starts ploughing as soon as the soil is softened by the spring rain, and repeats the process from four to six times, till he has reduced the land to a rich puddle. After the third ploughing the field is harrowed, and the little embankments, a few inches high, intended to retain the water, are repaired. When the seedlings are about seven or eight weeks old, they are taken from the nursery bed and carried in large bundles to the field. Here they are planted out in handfuls (*gusi*), each of which contains four or five plants. The distance at which these are planted from one another depends upon the fertility of the soil, but the handfuls are generally placed about 9 inches apart. It is not unfrequently the practice to steep the young plants in water before they are planted out, and, if they seem too luxuriant, the tops are cut off when they are removed from the nursery. Transplanting goes on from the beginning of July to the middle of September. The work is of a most arduous description, as it involves stooping for hours in a field of liquid mud, under the rays of a burning tropical sun. Before the end of the rains the crop is fully grown though the ears are still empty ; but about the beginning of October they begin to fill, and the field to turn to a rich yellow. From the middle of November to the middle of January harvesting is going on. The reapers

grasp a handful of the ears and cut them off about eight inches below the head. These handfuls (*hatta*) are tied up with a piece of straw, and made up into bundles, which are affixed to either end of the bamboos which the villagers carry across their shoulders. The principal kinds of *sail* are *terab-uli*, which ripens early about the beginning of December and has a large yellow grain, *balam* which has a large reddish grain, *khai* which has a large yellowish grain, and *thakur bhog* which has a fine grain and is extremely palatable. *Sail* is often grown on land from which a crop of *aus* has been already taken.

Aman is sown broadcast about the middle of April, the field having been previously prepared by four or five ploughings.

Aman.

It is grown in flooded tracts, and the embankments made between the fields are smaller than in the case of *sail*, and are often dispensed with altogether. There are three principal varieties. *Bhogdhan* is grown on higher land, is sown earlier, and ripens in November. *Parisok* and *badal* thrive in deeper water and are not harvested till December. Other varieties reported are *lengri*, *hiraman*, *gutakh*, *hater mura*, *paricha*, *goyai*, *kalakura*, *dudbal*, *naliuri*, *jari*, *longmur betair*, and *birun*. Of these *goyai*, *kalakura*, and *hiraman* have a long stem and so are generally grown in low lying tracts. *Badal*, *paricha*, *lengri*, and *gutakh* grow to a medium height and are sown on land which is neither very high nor very low. The other kinds grow on moderately high lands. *Dudbal*, *naliuri*, *jari*, and *longmur* are generally sown on land which lies near the hills.

Aus is generally grown near village sites, on the edge of *haors*, and on the banks of the rivers, which are usually above the level of the surrounding country. Ploughing usually begins when the ground has been softened by the rains of March, and is repeated some five or six times. The seed is sown broadcast in April and May, and the plant grows with such rapidity that it is ready for the sickle in June or July. *Aus* is sometimes transplanted, and is generally followed by a crop of *sail*. This kind of rice is usually cut off close by the ground, as, at the season of the year when it is reaped, the straw is in much request for fodder. The principal varieties of *aus* are *dumahi* which ripens in $2\frac{1}{2}$ months, *chengri* which takes 3 months to mature, and *murali* which is sown on low lying land and is ready in about 4 months. *Hati* is so called because in theory it takes 60 days to ripen, though in practice it generally requires from two to four weeks more. The yield varies with the length of time the crop is in the ground, and the outturn of *dumahi* or *hati* is considerably less than that of the slower growing varieties. In spite of the rapidity with which *aus* ripens it can be seen in some part of the district at most seasons of the year. Low land *aus* is sometimes sown at the beginning of February, and in places the harvesting is still in progress in the middle of October.

Boro is an early rice which is grown in *haors*, and more especially in the Sunamganj subdivision, before the floods rise. It is sown on high land near *bils* and streams, on low land which is under water at the time of transplantation

but dries up shortly afterwards, and on land which lies so low that it can dispense with what is required by the first two kinds of land, *i.e.*, artificial irrigation. A further advantage appertains to this low land in that no ploughing is required, but the crop is very liable to be destroyed by flood, and the outturn for *boro* is comparatively small. *Boro* rice is, however, generally grown on the sides of *haors*, after the floods subside, and is irrigated from the water which remains at the bottom of the basin, and is prevented from escaping by dams which also serve to raise its level. A simple form of water-lift is employed to raise the water from this central reservoir on to the fields. The trunk of a tree is hollowed out and an opening is left all along the upper surface. This trunk is placed at the edge of the reservoir, and the end that projects above the water is fastened by a rope to a stout bamboo that is fixed at right-angles to a bamboo upright. To the further end of this bamboo a heavy weight is affixed, which raises the opposite end and the hollow trunk attached to it, well above the water. When a man wishes to work the lift he stands on the further end of the hollow trunk and presses it below the water, which promptly runs in through the slit. He then steps off, the weight of the stone comes in to play, and the water is tilted up and runs into a channel just above the reservoir. The slope of the *haors* is very gradual, and by means of a series of these *kunds*, as they are called, the water is raised from the reservoir in the centre and distributed upwards from terrace to terrace. Towards the end of October, the fields are cleared of the aquatic plants that have taken root there in the rains, and the nursery beds are

prepared for the reception of the seed. The seed itself is soaked in water for four hours, then kept in a cool place for thirty-six hours, washed again, and left uncovered till the grain begins to shoot. It is then sown broadcast on the nursery and left to grow there for about two months. The young plants are then pulled up, kept for two days in a muddy place to allow the roots to develop, and finally planted out in the fields in January and February. The crop takes about three months to ripen, and, if it is submerged by an early flood, the villagers try to gather all they can by diving to the bottom, or by pulling it up with bamboo hooks. The cultivation of *boro* rice gives rise to a good deal of quarrelling. The owners of low land sometimes protect their crop by building dams which injure the fields of others, water is occasionally stolen, and the necessity for co-operation in the construction of dams and irrigation channels is a source of friction. This kind of rice is divided into two classes: *Sailboro*, and *boro*. The principal varieties of the former are *sail*, *tepi*, *banajira*, *pankait*, *bashful*, *atuatopa*, *rata*, *chandana*, *nahuatopa*, *gharmura*, *saulpani*, *barsail*, *harnarata*, and of the latter, *boro*, *kali boro*, *khaiya boro*, *lara boro*, *dhali boro* and *guabhir boro*.

Mustard is grown on low lying land in the Jaintia Parganas, which, in its natural state, is covered with high grass and reeds, on high land near the homestead from which a crop of seedlings has been already taken, and in *haors*. The total area under this plant is estimated at some 37,000 acres.

**Mustard and
Pulse.**

In Jaintia, the jungle is burnt at the beginning of the cold weather, and the ashes serve the purpose of manure. The seed is sown at the beginning of November after a single ploughing, and even this is occasionally dispensed with. In *haors* more ploughing is required, and the harvest is extremely insecure, as heavy rain in early spring may ruin the whole crop. High land near the homestead is ploughed some seven or eight times till reduced to dust, and is generally manured. The plants when ripe are pulled up, and the seed is trodden out by bullocks or threshed out with sticks. The area under pulse is comparatively small; the commonest varieties are *arhar* (*cajanus indicus*) and *maskalai* (*phaseolus mungo radiatus*).

Linseed, like mustard, is grown on high land near the village site as well as in the *haors*.

Linseed and Til.

The ground is ploughed up twice or thrice in December, the seed is sown, and the crop is ready for harvest towards the end of March. The plants are then pulled up and dried, the seed is trodden out by cattle or threshed out with a stick, and finally sifted and winnowed. Heavy rain in March is injurious to the crop, and pigs near the Khasi Hills often do damage.

Til (*sesamum indicum*) is generally grown near the village site, and is almost a garden crop. The land is ploughed five or six times till reduced to a fine tilth, and is divided into little blocks about five feet square, by trenches three inches deep and nine inches broad. When the plants are about six inches high they are carefully weeded and hoed, and earth is spread over

their roots. The seed ripens in May, and the plants are dried and treated in the same way as linseed. Linseed is said to cover some sixty-nine or seventy thousand acres, whereas *til* is not grown on more than three or four thousand acres.

The area under sugar cane is said to be declining, as the profits obtained are considered hardly commensurate with the labour that it entails. It is sometimes planted on high land near the homestead, but the bulk of the area under cane is situated in the hills to the south of the Karimganj and South Sylhet subdivisions, where it is grown by ex-garden coolies. The following are the principal varieties cultivated in the district. The *dhol* or *dhali* stands about seven feet high, and is generally grown near homesteads, the *khagra* is a hard and thin variety of the *dhali*, and the *bombai* is of a purple colour and is juicier than either of the other two. The land is hoed up till it is reduced to a fine tilth, and the tops planted in trenches between April and June. The patch is fenced with split bamboo, and there is usually a stout hedge of *arhar dal* (*cajanus indicus*), but constant watching is required to scare away jackals and other animals, and an empty oil tin with a clapper is generally to be seen suspended over each field. While the crop is growing it is continually hoed and weeded, and about August the leaves should be tied up round each cluster of canes, which is a troublesome proceeding. The earth from the ridges is heaped about the roots to strengthen their hold upon the soil, and this process is continued until the relative positions of

ridge and trench are reversed, and the canes stand upon ridges with the trenches in between.

The native form of mill consists of two wooden rollers, fixed side by side in a trough hollowed out of a heavy block of wood. The tops of the two rollers pass through a beam, supported by uprights let through the lower block of wood into the ground, and are cut into the form of screws which fit into one another. To the larger of the two is affixed a pole, which is driven round in a circle, and thus causes the rollers to revolve. The motive power is usually supplied by the villagers themselves, but buffaloes are occasionally used for the work. Of recent years the wooden mill has been largely displaced by the iron mill which is easier to work. The cane is placed between the rollers, and crushed as it is slowly forced through. The juice trickles from the trough into an earthen vessel, and is then transferred to a small boat scooped out of a log. When twelve or fifteen gallons have been collected boiling begins. The furnace is hollowed out of the ground, and has four circular openings to receive the cauldrons, which are made of the most durable kinds of potter's clay. Two of these vessels are placed about 9 feet from the furnace mouth, and only serve to heat the juice before it is transferred to the other vessels to be boiled. When the juice has been reduced to the proper condition it is ladled into a wooden vessel shaped like a small dug out, and is stirred for half an hour. As the stirring continues the liquid loses its dark brown colour, and assumes the consistency and hue of yellow mud. It is then stored in earthen pots and the process

is complete. Pargana Taraf in the Habiganj subdivision is especially noted for the excellence of the molasses manufactured there.

The cultivation of jute is said to be extending but has not yet attained to any great dimensions, and in 1903-04 the total estimated area under this crop was only 9,200 acres. The plant is grown on high land near the village, and on the banks of the Kusiara and the Manu in the North and South Sylhet subdivisions. The land is ploughed, and ploughed deeply, some eight or ten times. The seeds are sown in March or April, and when the plants are from some ten to fifteen inches high, a harrow (*bindha*), with teeth nearly one foot in length, is dragged over the field, and loosens the soil at the same time that it removes the weeds. When the plant is sown near the homestead the ground is liberally manured with cow-dung.

The plants are cut in August and September, stripped of their leaves, tied in bundles, and left to rot in pools of water from seven to twelve days. When they are ready a handful of stems is taken up, broken in the middle, and beaten to and fro in the water, till the inner part drops out and only the fibre remains. The bundles of fibre are then dried and are ready for transport to the market. The leaves of the jute plant are eaten fresh as a vegetable, and when dried are thought to possess medicinal properties. Small patches of rhea (*boehmeria nivea*) are grown in the gardens of the fishing castes, where it is heavily manured. The skin is stripped off from the stem and the fibre separated from the outer covering. The

thread obtained is exceptionally strong and durable, but the difficulty of decortication has hitherto prevented the growth of rhea on a commercial scale.

Cotton is grown by Tipperas on the hills in the south of the district. The fibre is stiff and has a short staple, but the percentage of fibre to seed is unusually high.

One of the commonest of garden trees is the plantain (*musa sapientum*), of which there are several varieties. The best fruit is obtained from the *chenichampa*, which has a small well flavoured fruit, the *kulapati* and *safari*, large trees which yield large plantains, and the *dingamanik*, which has a soft trunk and long fruits, which are generally gathered and sold while still quite green, as if kept when ripe they soon develop a saline taste. There are two kinds of *athia* known as *ghi* and *bhim*. Both are valued for their soft leaves and the coolness of the pulp, but the former is preferred as it has fewer seeds. The *kachakala* has the same shape as the *athia*, but has a sharper taste and is generally used as a vegetable. Other varieties of the plantain are the *sail* or *gopi*, the *bartaban*, and *gerasunder*. The betelnut (*areca catechu*) is very common in the eastern part of the district, where groves of these graceful palms add much to the beauty of the landscape. The tree does not thrive if the roots are covered with water, and it is seldom seen in the submerged tracts in the western portion of Sylhet. Of recent years it has been attacked by an insect pest which makes it gradually shrivel up and die. The *pan* vine (*piper betel*) is occasionally trained up the stem of

the areca palm, but is generally grown by Baruis in carefully fenced gardens along the banks of the Kusiara or Manu, or in the hilly-country to the south. Other common fruit trees are the jack fruit and the mango, but the fruit of the latter tree is generally spoilt by worms. The vegetables which are most in evidence are gourds, pumpkins, cucumbers, beans, different kinds of arums (*kachu*), some of which attain an enormous size, radishes, and brinjals.

The agricultural implements in use are of a very simple character. The plough is usually made of the mango or jack fruit tree, or some other hard wood.

**Agricultural
implements. The
plough.**

It consists of three parts—the handle and body which are usually all in one piece, the pole which joins the plough at the junction of the handle and the body, and the yoke, which is merely a piece of bamboo fastened by rope at right angles to the pole, with pegs affixed to it to keep it from sliding from the necks of the bullocks. The front portion of the body is sharpened to a point which is shod with iron. The whole instrument is suited to the wretched class of animal required to draw it. It weighs as a rule about 20lbs., and, when cattle are used, the yoke seldom stands as much as 36 inches from the ground. When buffaloes are employed the whole plough is constructed on a larger scale. It is obvious that such an implement can only penetrate from three to four inches into the soil, but the wretched quality of the plough cattle prohibits the use of a more effective instrument. Ploughs in Sylhet are nearly always purchased, and not made at home as in the Assam Valley, and cost from As. 12 to Re. 1.

The harrow (*moi*) is generally a bamboo ladder, about eight feet in length, on which a man stands as it is drawn across the field. It is used to crush the clods turned up by the plough before mustard or summer rice is sown, and to reduce the fields required for wet rice to puddle. Its place is sometimes taken by a plain log of wood. It is prepared by the cultivator himself from the bamboos growing in his garden. Hoes (*kodalis*) are used to trim the embankments (*ails*) which help to retain the water. The head is bought in the bazar and costs from As. 12 to Re. 1-4, and is fitted with a shaft by the farmer himself. Sickles, with which the rice is reaped, have also to be purchased, and cost from two to four annas. The sugarcane mill has been already described in the paragraph dealing with the preparation of molasses. The ordinary implement used for husking grain is the *dheki*, a long beam with a pestle affixed at the end, which is supported by two posts at about two-thirds of the length from the head. The shorter end is depressed by the foot, and the pestle is thus raised into the air; the weight is then removed and the pestle falls into a small hole in which the grain is placed. When only a small quantity of grain is to be husked a mortar (*gyle*) and pestle (*sekait* or *chia*) are employed. All of these implements are usually made by carpenters and purchased by the cultivator.

Storage and threshing of grain. The grain is threshed as soon as it is brought from the field, and stored either in a separate granary (*bhararghor*), or, more usually, in a part of one of the cultivator's houses which has been set apart for the purpose. It is

threshed by driving cattle round and round over the heap of grain and straw, till the ears have been finally separated from the stalk. The grain is next passed through a sieve, and placed in a flat bamboo tray called *kula*. It is then jerked into the air and allowed to drop back into the tray, or held aloft and allowed to fall slowly to the ground till gradually the chaff is carried off.

The character of the rice crop depends more upon a suitable supply of water than upon the chemical constituents of the soil on which it is grown, and of water in Sylhet there is very seldom any scarcity. It is however, flood, not drought, that is the farmer's enemy, and the harvest often suffers from excessive and unseasonable rain. The different soils of the district have never been carefully examined, but the following kinds are recognised by the cultivator. *Domarua* or *domatiya* is composed of clay with a slight admixture of sand, and is well suited to the growth of double crops. *Athalu* is a heavy clayey soil on which *aman* is generally grown, while *chegua* contains a large proportion of decayed vegetable matter, and is found in low swampy ground. Rice planted on this soil at first does well but tends to produce more leaf than grain. *Balua*, a sandy soil found near the rivers which issue from the northern hills, is far from fertile, and *bhurburia*, a clay soil much broken up by worms, is thought to be more suitable for vegetables than for rice.

Serious damage is sometimes done to the growing crop by the insects which are called *khatra*, *loai*, *poka*, and *monu* (*leptocorisa acuta*). The *monu* is a small bug which injures the rice plant by feeding on the stems and sucking all the sap from the young grains. It is most prevalent in July and August, and is particularly in evidence during a spell of hot dry weather. High wind and rains drive it back into the jungles, and good results are obtained by lighting fires, of vegetable refuse to windward. The best remedy of all is to collect the insects by smearing a winnowing fan with some glutinous substance and brushing it over the ears of grain, when many of the bugs will be found adhering to the fan. This remedy should be tried in the morning or late afternoon, as the insects do not feed in the heat of the day. The *khatra* appears in April and May, the *loai* in May and June and the *poka* in November and December. Rain is wanted when sail is sown and is transplanted, but is not needed for the sowing of *aus* and *aman*. During every stage of its growth the plant is benefited by moderate showers, but rain is absolutely essential at the time when the ears are first appearing. Hail storms in December sometimes lay the crop and add materially to the cost of reaping, but fortunately are very local in their action.

The outturn of different crops varies according to the character of the season, and also to a great extent according to the character and level of the soil on which they are grown.

Yield and value of crops.

		lbs.
Sail	..	1,000
Aus	..	800
Aman	..	950
Boro	..	1,050
Mustard	..	450
Molasses	..	2,400

The statement in the margin shows the normal yield per acre laid down by the Agricultural Department after a long series of experiments. These

figures only represent a general mean, and, even in a normal year, there are many fields whose outturn varies largely from the average. The yield of rice, it may be premised, is expressed in terms of husked grain. Like the outturn, the cash value of the crop can only be approximately ascertained. The prices obtained by the raiyats vary to some extent in different parts of the district, but probably average from Re. 1-4-0 to Re. 1-12-0 per maund of unhusked grain. Assuming that unhusked paddy yields 62 per cent. of clean rice, it would appear that the value of the harvest from an acre of *sail*, *boro*, or *aman* is roughly from 25 to 35 rupees, and from an acre of *aus* from 20 to 30 rupees. For mustard the villagers generally get from Rs. 2-12 to Rs. 4 a maund, so that the yield from one acre is worth from 15 to 22 rupees. The price of molasses varies considerably from time to time and from place to place, and ranges from Rs. 4 to Rs. 6 per maund. The value of the yield of an acre of cane ranges accordingly from Rs. 120 to Rs. 180.

There is very little, as yet, in the shape of intensive cultivation, the villagers do little or nothing to improve the character of the crop beyond selecting the best grain for seed, and manure is seldom used. Cowdung is scattered over the seedling beds and jute fields, and applied to garden crops, but large quantities of this excellent fertilizer are

General remarks.

allowed to go to waste. Sugarcane is often treated with oil cake, and, in parts of the district, the stubble and sods turned up by the plough are burned, and the ashes help to fertilize the soil. Mustard land also is enriched with the ashes of the jungle growing on it. As a general rule the peasant trusts to the heavy rainfall and to deposits of silt to do all that is required, and does not adopt either new methods or new staples. The cultivation of jute is, however, spreading, and in Madhabpur onions and potatoes are coming into favour. The majority of the farmers are small men, who have neither the means nor the knowledge which are requisite in the pioneer ; and little improvement can be looked for, unless Government or some of the larger zamindars are prepared to show the way. The system of giving advances on the standing crop is not much in vogue. An exception must be made in the case of jute, but the total area under this fibre is not large. In Karimganj small advances are sometimes given for mustard, linseed, cotton, and molasses, which are then sold to the creditor at a price a little below that ruling in the open market, but only a small share of the profits of the farmer are diverted by this channel into the pockets of the capitalist.

There are three varieties of buffalo in Sylhet, the
Live stock. Manipuri which comes from the state
Buffaloes. of that name, the Bangar which is
imported from other parts of India, and a hybrid formed
by crossing the other two. The Bangar, though a much
more satisfactory animal than the cow or bullock of

Sylhet, is inferior both in size and appearance to the hybrid, which again is not as fine an animal as a pure bred Manipuri.

Professional graziers are not so numerous as in the Assam Valley, the scarcity of pasture in the rains being no doubt a serious difficulty. There are some ten herds of buffaloes in the Dharmapasha thana on the extreme west of the Sunamganj subdivision, four in Fenchuganj, Maulavi Bazar, and Rajnagar, one or two in Matiganj and Karimganj, and fifteen or sixteen in the Hakaluki *haor*. Elsewhere the number of professional graziers is very small.

A cow is said to remain in milk for about ten months and yields at the beginning from two to four seers every day. The amount gradually decreases till a month or so before the next calf comes, when it ceases altogether. The milk is very white and rich in fatty matters, and consequently yields a large proportion of *ghi*. The cows are said to begin breeding when three years old, and to continue doing so for fifteen years, during which time they give birth on the average to about ten calves. The normal life of a buffalo is from 25 to 30 years. Age is judged by the incisor teeth, and a buffalo is not aged till it is twelve years old. Male buffaloes vary in price from Rs. 20 to Rs. 100, and cows from Rs. 30 to Rs. 120. The Bangar buffaloes are cheaper than the hybrids, and much less costly than the fine animals of Manipuri breed. The prices paid in the Jaintia Parganas are considerably higher than those prevailing in the west and south of the district.

The cattle of Sylhet are some of the sorriest of their kind, and are undersized, half starved, and not unfrequently diseased. Everything is left to that stern stepmother, Nature, from the time when the most active, and probably therefore the youngest, bull in the herd has succeeded in covering a cow, to the time when the progeny, worn out by semi-starvation and over work lies down to die. No attention is paid to breeding, cows and bulls alike exercise their reproductive powers at the earliest possible moment, and continue to do so without intermission. The parents of the calf are often close relations, and no attempt is ever made to effect any improvements in the stock. In cases of sickness remedies are seldom thought of, and the infected animal is allowed to mingle with the herd. The natural result is the production of a breed of undersized, weak, and miserable animals which are hardly strong enough to drag even the small native plough. Bullocks and cows alike are said to cost from Rs. 10 to Rs. 50, but it is very seldom that the higher price is paid. Rs. 15 to Rs. 20 is the more usual figure and the animals are generally dear at that.

In the Sunamganj subdivision, there is excellent grazing to be obtained in the cold weather when the floods drain off from the marshes, but during the rains the condition of the live stock is far from satisfactory. Nearly the whole of the country goes under water, and the cattle have to be kept in the immediate neighbourhood of the homestead and are fed on reeds and coarse grass, brought in boats from the higher ground at the foot of the hills, or on

aquatic plants and grass pulled from the bottom of the *jhils*. Rice straw, it is said, is not very generally used, partly because the floods come on very soon after the reaping of the *boro* crop, partly because the straw decomposes very rapidly. In the Habiganj subdivision, the people graze their cattle on the Raghunandan and Satgaon hills, but the area available has been considerably decreased of recent years by the opening of tea gardens. In the north and west, there are marshes which afford excellent fodder in the dry season, but this part of the district is very densely peopled and the villagers are said to experience difficulty in obtaining food for their cattle in the rains. Grass and rice straw are stored against this time of scarcity, but the supply not unfrequently runs short, and thefts of fodder are said to be fairly common. The conditions in North Sylhet are very similar. In Karimganj there is a considerable area of high land on which the cattle can be grazed during the rains, and in the dry season the most excellent pasture can be obtained in the Hakaiki *haor*, and in other places, such as the Anair and Hanra Kuri *haors* and the Chapra and Medal *bils*. Rice Straw, as in other parts of the district, is stored for use in the rainy season, but at its best it is unsatisfactory fodder, and it is, perhaps, partly responsible for the poor condition of the Sylhetti cattle.

The most common forms of cattle disease prevalent in the district are, foot and mouth disease, rinderpest (*guti*), a disease called *kachua*, the principal symptoms of which are flatulence and diarrhoea, diarrhoea (*marki*), cholera,

matikhoa, the first symptom of which is, as the name implies, the eating of earth followed by dysentery, and *sukuna* when the animal refuses to eat and dies after ten days or in a fortnight.

The goats are almost as degenerate as the cattle. They yield but little milk, the whole of which is taken by the kids, and are only kept for food or sacrifice. At night they are usually shut up in a small out house with a raised floor, which is approached by a slanting board or sloping bamboo platform, as a protection against jackals. There is no indigenous breed of sheep, and the animals imported do not thrive. The total number in the district is extremely small. The country ponies are, if anything, even more miserable specimens than the cattle. Few of them are as much as twelve hands in height, and they possess neither pace, stamina, or endurance. They have not in fact a single redeeming feature, and it is a matter for congratulation that their numbers are so small. European residents in Sylhet are compelled to obtain all their horse flesh from Calcutta.

Floods are one of the most serious difficulties with which agriculture is confronted, but they are of so regular and general a character that they are treated by the husbandman as part of the established course of nature. In the chapter on the history of the district reference has been already made to the destructive inundations at the end of the eighteenth century, to the attempts made to control these deluges by a system of embankments, and to the conclusion to which

the authorities were ultimately forced that they were engaged upon an absolutely hopeless enterprise. During the rains the north and west of Sunamganj is over-flowed by the waters of the various rivers that come down from the hills such as the Panatirtha, Maheskhal, Someshwari, Pinda, Kangsa, Surma, Kalni, Khasimara, Mugai and Piyain. The north and west of Habiganj are submerged by the floods of the Dhaleswari, Sutang, Balabhadra, and Khawai; and in Jaintia, the Lain, Goyain, Peein, Lubha and other streams inundate the low lying tracts. This is, however, only the fringe of marshy country which on three sides surrounds the higher and more fertile portions of the district. Though it must be admitted that floods occasionally do damage, it is obvious that the harm done in the more elevated tracts cannot be very serious or the district would not be able to support over 2,000,000 persons in a condition of comparative comfort. During the past twenty years, the floods of 1883, 1885, 1893, and 1897 have been unusually high, but no measures of relief were necessary.

Reference must now be made to one of the most important crops of the district, a crop
 Tea. which has attracted a considerable number of Europeans* to Sylhet, and has led to a large local expenditure of British capital. Tea is said to have been first discovered growing wild in the Assam Valley in 1823, and the first garden was opened, in Lakhimpur, in 1835. In 1855, wild tea was discovered in the Surma Valley, and the first garden was opened in Sylhet at

* The number of European planters in 1903 was : North Sylhet 15, Habiganj 26, South Sylhet 102, and Karimganj 51.

Malnichara in 1857. The progress of the industry was at first extremely slow, and the merits of Sylhet as a tea producing district were not recognised till comparatively late. The earliest figures available are those for 1868. In that year the area under tea cultivation was returned at 2,050 acres, and the outturn at 251,000 lbs. Even in 1884 the outturn was only 5,561,000 lbs, which was less than half the crop obtained in Cachar, Sibsagar, or Lakhimpur. A great change then took place, and both the area under cultivation and the outturn increased with remarkable rapidity. By 1893 the yield amounted to 20,627,000 lbs. which nearly equalled that of Sibsagar, the largest tea producing district in Assam. The upward tendency was maintained, and in 1900, there were 71,490 acres under plant, which yielded 35,042,000 lbs. of manufactured tea, which was more than 4,000,000 lbs. in excess of that produced in any other district in the Province.

Statistics for later years will be found in Table VI.

Labourers employed.	which shows the number of gardens in each subdivision, the area under tea, the outturn, and the labour force.
--------------------------------	---

Such local labour as is available for employment is generally unsatisfactory, and the coolies required for working the plantations have to be brought from other parts of India. In the ten years ending with 1890, the total number so imported was 71,950, and during the next decade it was nearly doubled and amounted to 141,650. The largest numbers imported in any given year were 26,450 in 1895 and 27,080 in 1896.

The following statement shows the locality from which the majority of these persons come. The climate of Sylhet is not unsuited to the natives of the United Provinces and planters are thus enabled to work their gardens with labourers who in Assam would quickly sicken and die. The coolies who are most difficult to procure, and who cannot, as a rule, be imported to Assam for less than a hundred rupees a head, are Sonthals and other jungly tribes from the Chota Nagpur plateau. Of them there are comparatively few, and one of the most important assets in the planter's favour in Sylhet is the fact that he can obtain his own labour at fairly moderate rates.

1901.	Number	Percentage.
Total	144,876	...
Chota Nagpur...	22,745	16
Other parts of Bengal	22,067	15
United Provinces	41,169	28
Central Provinces	12,681	9
Madras	10,079	7

The gross cost of importation is, however, large and few people would be willing to expend considerable sums of money in bringing up coolies to the district, without some guarantee that for a time, at any rate, they would be able to retain their services. This guarantee is afforded by Act XIII of 1859, which empowers a magistrate to order a man who has taken an advance of money on

account of work to be done by him, to complete his contract, and to punish him with imprisonment if he declines to carry out this order. The number of cases in which the coolie is actually confined is, however, small, and in 1903 only 13 deserters were punished with imprisonment, or less than one in every 10,000 of the labour force. It has already been remarked that the gardens of Sylhet are fairly healthy on the whole. Unfortunately the mortality is occasionally high on newly opened gardens, and amongst batches of new coolies, who often come up in a poor state of health, especially in times of famine, which is the very time when recruiting is most brisk. The average mortality amongst adult labourers in the ten years 1880-89 was 35 per mille, and in the next decade the rate was 37. During the past three years, (1900-03) it has not exceeded 25 per mille. 1897 was the most unhealthy year, with a death rate of 51 per mille. But this, after all, was no higher than the recorded mortality for the Province as a whole, which, thanks to the extremely defective agency for registration, was undoubtedly much below the mortality which actually occurred.

A friable red loam is that soil that proves most suitable for tea. The plant requires a well distributed and heavy rainfall, but anything in the shape of water-logging is most prejudicial to its growth, and gardens should only be planted out on land which can be well drained. Land which in its natural state is covered with tree forest, is usually considered the most suitable, as the absence of timber generally shows either that the place is liable to flood, or that the soil is sandy, or that the rainfall is

deficient, but excellent results have been obtained in Sylhet from reclaimed marsh land. Most of these *bil* gardens are situated in the Langai valley, but they are also found in the valleys of the Juri or Sonai. Care is taken to select a piece of marsh land which is above flood level, and it is then thoroughly drained. This is a very expensive operation, and the mere drainage of a *bil* garden costs nearly as much as the complete opening out of an estate on higher land. The main drain is from 12 to 15 feet deep and as many wide, and every twelve yards it is joined by lateral drains. The yield is, however, unusually large, and these gardens have proved to be a very good investment in spite of the heavy initial expenditure entailed. The first *bil* garden was opened at Adamtila in 1878, and the largest gardens of this kind in Sylhet are Siphinjuri, Patni, Piplagul, Champabari, Tilbura, Chandkhira, Langai, and Sonakhira, all of which are situated in the Langai valley.

Four distinct varieties of wild tea are recognised—

Varieties of Plant.

Assam indigenous, which has a leaf from 6 to $7\frac{3}{4}$ inches in length by $2\frac{3}{8}$ to $2\frac{7}{8}$ inches in width, Manipur or Burma indigenous with a larger, darker, and coarser leaf than the preceding variety, Lushai or Cachar indigenous, whose mature leaf is from 12 to 14 inches long, and from 6 to $7\frac{1}{2}$ inches wide, and the Naga indigenous which has a long and narrow leaf. In addition to these four varieties there is the China plant, and different kinds of hybrids. The China tea is a squat and bushy shrub with small leaves, which gives a lower yield per acre than the other kinds. It is many years since China seed was planted out in new clearances,

and considerable areas covered by this plant have been abandoned. In its natural state the indigenous plant attains to the dimensions of a tree, varying from 20 to 50 feet in height, though its girth seldom exceeds two feet. It has a vigorous growth and yields a large outturn of fine flavoured tea, but is delicate when young. Of the hybrid variety there are many qualities, ranging from nearly pure indigenous to nearly pure China. A plant with a very small admixture of China is usually preferred, as this imparts the hardiness the want of which is the one defect in the indigenous variety. The best seed grown in Sylhet is obtained from the Lakatura garden. The price varies largely in accordance with the demand, and, of recent years, has ranged from Rs. 150 a maund prior to 1898 to Rs. 15 to 35 a maund in 1903.

The seed is planted in nursery beds in December and January, and kept under shade
System of Cultivation. till the young plants are three or four inches above the ground. Transplanting goes on between April and July, whenever there is rain, the plants being usually placed from four to five feet apart. During the first two years of their life little more is required than to keep the plantation clear of weeds. By this time the plants are from two to four feet high, and at the end of the rains they are pruned down to fifteen inches or a foot, to encourage lateral growth. In the third year the plant can be lightly plucked over but the yield of leaf is small. Pruning is continued every year. Only about two inches are left of the wood formed since the previous pruning and

2000
2000

any unhealthy or stunted branches are removed. During the rains, the garden is hoed over several times, in order to render the soil permeable both to rain water and the roots of the bush. At the end of the rains the ground is hoed up to the depth of 8 or 9 inches. The object of this is to protect the land from drought as the hoed up soil prevents the evaporation of water from the lower strata. It, also, adds to the fertility of the land by exposing it to air, light, and changes of temperature. Manure has hitherto been little used. Oil cake and cowdung are, however, sometimes spread about the plants, and exhausted land is not unfrequently top dressed with rich soil from a neighbouring marsh. The cost of these operations is considerable and they are not invariably successful from the pecuniary point of view. *Matikalai* (*phaseolus mungo radiatus*) is sometimes sown among the bushes and afterwards hoed in as a green manure.

Plucking begins in April and is continued till the beginning of December. The bud and the two top leaves are taken from each shoot, but fresh leaves soon appear, and in about five weeks time the shoot is ready to be plucked again. This throwing out of new leaves is termed a flush, and there are usually six or seven full flushes in a season, though each bush is picked over every ten days or so, as the twigs develop at different times. The plucking is usually done by women and children, while the men are engaged in hoeing up the ground around the plants.

The plant is liable to be attacked by a large number of pests, the best known being the tea mosquito or blight, the green fly, and the red spider. A full account

of these pests will be found in "The pests and blights of the tea plant" by Watt and Mann, Calcutta, 1903.

When the leaf has been taken to the factory, it is spread out in thin layers on trays and allowed to wither. In fine weather the process takes about 18 hours, but if it is cold and wet it may be 30 hours before the leaf is ready. When the leaf has been properly withered it is placed in the rolling machines. The object of rolling is to break up the cellular matter and liberate the juices, and to give a twist to the leaf. Rolling takes about 40 minutes, and after this the leaf is spread in a cool room for from 3 to 5 hours to ferment. It is then placed on trays in the firing machines, through which hot air is driven, until the last trace of moisture has been expelled, and the tea is crisp to the touch. The leaf is then passed through sieves of varying degrees of fineness, and the tea sorted into different grades. The best and most expensive quality is called broken orange pekoe and is made from the bud or tip, which contains all the good qualities of tea in a more concentrated form than any of the other leaves, is stronger, and has a more delicate flavour. The other grades, which are differentiated by the size of the mesh through which they pass, are orange pekoe, broken pekoe, pekoe, souchong, and fannings. After the tea has been sorted it is fired once more to remove any moisture it may have absorbed from the surrounding atmosphere, and is packed in lead lined boxes while it is still warm. Tea loses largely in weight during the process of manufacture, and about

four pounds of green leaf are required to produce one pound of the finished article.

Of recent years an attempt has been made to introduce the manufacture of green tea in order to meet the demands of the American market. In 1902, the Indian Tea Association offered a bounty of $1\frac{1}{2}$ annas on every pound of green tea manufactured. The following year this bounty was reduced by half, and over a million pounds of green tea were exported from Sylhet. The principal difference between the manufacture of green and black tea is that the former article is not fermented. As soon as the leaf comes in it is steamed in a drum for about half a minute, a process which turns it a bright green colour, and effectually stops all fermentation. Excess moisture is removed by a hydro-extractor or centrifugal machine, and it is then rolled, fired, and sorted into the following different grades, pinhead gunpowder, gunpowder, young hyson, hyson No. 1, hyson No. 2, twanky, and dust. The infused leaf should be of a bright green colour, and the liquor of a very pale yellow shade. Most of this tea is sent to North America, but a small quantity is sold in the mid-land counties of England.

The average yield per acre varies largely in different years and on different gardens, but **Output and Prices.** may usually be taken as at about 500 lbs. per acre. Since 1897, the lowest average was 412 lbs. in 1898, the highest 536 lbs. in the following year. Prices, of recent years, have been on the downward grade. In 1868, the Commissioners appointed to enquire

into the state and prospects of tea cultivation in Assam, Cachar, and Sylhet, reported that tea must fetch at least two shillings a pound if the industry was to be a profitable one. In 1887, the first year for which returns are available, Surma Valley teas fetched about As. 8 per lb. The price fluctuates considerably and in 1894 was as high as 8 annas 8 pie. It then began to fall, and in 1898 was only 5 annas, while in 1902, it was 4 annas 3 pie; but in the following year it was nearly an anna higher. The fall in price has, however, been accompanied by a great decrease in the cost of production, which is largely due, amongst other causes, to the increase in the average output. In 1872, the highest yield from any garden was 315 lbs per acre—thirty years later it was probably four times as large. Most of the tea gardens are situated on the low hills in the south of the Habiganj, South Sylhet, and Karimganj subdivisions. In South Sylhet they reach almost up to the Kusiara river, some distance to the north of Maulavi Bazar. In Appendix A will be found a table showing for each tea garden in the district, its gross area and the area under plant, the labour force, the names of the owners, and the distance from the garden to the nearest subdivisional head-quarters station.

In the Fifth Report submitted to Parliament in 1812 A. D. by the Select Committee
Forests. on the affairs of the East India Company it is said that Sylhet is chiefly productive in rice and cotton, but is of more importance from the natural growth of timber which is largely used for boat building. It is probable that, even at that time, Sylhet timber, like

Sylhet lime, was actually brought from places which were beyond the borders of the district, and, at the present day, though considerable quantities of forest produce pass from Sylhet into Bengal, most of it was grown in Cachar, Manipur and the Lushai and Tippera Hills.

The Sylhet state forests fall into two main classes, the reserved forests, which cover an area of 103 square miles, and the unclassified state forests, which, in 1902-03, covered an area of 179 square miles. Unclassed state forest is neither more nor less than 'waste land at the disposal of Government,' and does not of necessity possess the very smallest silvan characteristics. It may be a large swamp which goes under water in the rains and is totally destitute of trees, it may be a small piece of arable land, which has been resigned by its former owner and has not yet been settled with any other person, or it may be, as its name suggests actual tree forest. In the case of Sylhet, the proportion of unclassified state forest which falls in the latter category is probably not large. Most of this unsettled Government waste is situated in the Jaintia Parganas, or in swamps and hills in the south of the district.

The management of the Government forests is generally entrusted to an Extra Assistant Conservator who has a sanctioned staff of 4 deputy rangers, 3 foresters, 17 head guards and 42 forest guards. Settlement holders in the Jaintia and Pratapgarh Parganas and the Langai-

Singla valleys are allowed to remove from unclassed state forests forest produce, other than reserved trees, free of charge, provided that it is for their own consumption and not for sale. Permits are also issued to traders for timber and other forest produce. On this a royalty is paid, the rates charged varying from one to four annas for every cubic foot of timber in the rough, or for every hundred bamboos. If the timber is situated in a reserve, the tree must not be felled till it has been marked by a forest officer deputed for the purpose. Timber or other forest produce is almost invariably removed by water, and ultimately reaches one or other of the revenue stations of the district.* Here it is measured up and assessed to royalty, which may be sent by postal order to the nearest treasury. On receipt of the treasury voucher, a pass is issued, and the owner is allowed to remove his property. Forest produce coming from private land is also stopped at these stations, but, on the production of a certificate of origin signed by the owner or his agent, a pass is issued for its removal.

The most valuable timber trees found in the district, which are largely used in the construction of houses and boats, are jarul or ajhar (*lagerstroemia reginæ*), sam (*artocarpus chaplasha*), gundroi (*cinnamomum glanduliferum*), kurta

Trees and trade in forest produce.

* The following are the revenue stations in Sylhet :—

| 4. Maulavi Bazar " " Manu. | Jadukata. |
| 5. Manumukh " " Kusiya. | 10. Muchikandi " " Khowai. |
| 6. Kanairghat " " Surma. | 11. Dinarpur " " Gopla. |

(*isonandra polyantha*), rata (*dysoxylum binectariferum*) and poma (*cedrela toona*). Simul (*bombax malabaricum*), am (*magnifera*), kadam (*anthocephalus cadamba*) and harish (*albizzia stipulata*) are converted into tea boxes. The trees are felled, sawn into logs about fifteen feet in length, and dragged by elephants to the nearest stream, down which they are floated to their destination. The principal centres of the timber trade are Patharkandi in the Langai valley, Karimganj, Sylhet, Moulavi Bazar, Habiganj, Bhanga, Ajmiriganj and Lakhai. The industry is not confined to any particular section of the community, but in North Sylhet most of the saw pits are the property of Muhammadans. From the figures given in Table VIII it will be seen that nearly all the fuel, and fully half the timber extracted from Government forests in Sylhet, is obtained from unclassified state forest. Minor products from which revenue is realized are bamboos, thatching grass, and grazing. Fees are levied on all animals grazed by professional herdsmen in the Hakaluki *haor*,* and the exclusive right to cut bamboos and thatching grass in the more inaccessible portions of the district is put up to auction.

The Langai forest, which is situated at the southern end of the Langai valley, between the
Reserved Forests. Pratapgarh and Pathariya hills, was originally constituted a reserve by notification No. 57, dated 17th September 1886. A portion of it was subsequently disforested, and revised boundaries, which include an area of some 80 square miles, were gazetted in notification No.

* The number affected is not very large. In 1902-03 fees were levied on 1,485 buffaloes, 1,146 cattle and 48 other animals.

3341 R., dated 13th September 1901. The greater part of this area consists of hilly country which slopes towards the river, interspersed with stretches of level land covered with high grass. The soil is a deep sandy loam which is rich in vegetable mould, and in addition to the trees already mentioned the following are found: Shundi (*mechelin* sp.), ping (*cynometra polyandra*), koroi (*albizzia procera*), karal (*dipterocarpus* sp), chatni (*alstonia scholaris*) and sitarjat (*echinocarpus tiliaceus*). Timber can be extracted without much difficulty, and floated down the Langai to the Kusiya, whence it can be distributed to every part of the district. The average annual receipts from this forest in the three years ending with 1902-03 were about Rs. 13,000. The Singla reserve adjoins the Langai on the east and resembles it in its general characteristics. It covers an area of 23 square miles, according to the boundaries laid down in Notification No. 3341 R., dated 13th September 1901. Timber felled in this reserve is floated down the Sonai, to the Kusiya, but from Table VII it appears that the average annual receipts, since the forest was formed into a separate reserve, have only been about Rs. 1,200.

CHAPTER V.

INDUSTRIES.

Lime—Pottery—Brass and Bell-metal—Weaving—Boat building—Workers in wood—Carving and children's toys—Cane work—Other manufactures—Fishing—Lac.

The following is a list of the manufactures of Sylhet apart from tea : Slaked lime, **Manufactures.** pottery, brass and bell-metal utensils, cotton and silk cloths, boats, wooden articles and palanquins, children's toys, chessmen, jewellery, shell bracelets and inlaid iron work, iron and stone work, fire-works, *hookhas* and *titiyas*, mats, leaf umbrellas and fans, cane furniture, attar of agar, various kinds of oil, cane and bamboo baskets, cheese, *ghi*, and molasses.

Lime is brought from the quarries in the Khasi Hills and is burnt on either side of the **Lime.** Surma river from Chhatak to some distance below Sunamganj. A full account of the history of the industry will be found in the Gazetteer of the Khasi and Jaintia Hills. The process of manufacture is extremely simple. Big holes of the shape of an inverted cone and about ten feet deep are dug near the bank of the river. They are filled with stone which is piled up till the structure rises about five feet above the surface of the ground, and the upper portion is then covered with straw and plastered over with mud. A hole is left at the bottom facing the river, and a fire is built right underneath the centre of the pile of rock and

continuously fed with reeds for some twelve to fourteen days, till the stone is thoroughly calcined. A little water is then sprinkled over it and the lime is ready for the market. The importance of the industry may be judged from the fact that over two million maunds of lime and stone were exported from Sylhet in 1902-1903. The following figures give some idea of the cost of the different stages by which limestone cliffs in the Khasi Hills are converted into slaked lime at Calcutta.

The approximate charges for laying down 1,000 maunds of stone at Chhatak are—Quarrying Rs. 30; dynamite Rs. 2; trollying to river's bank Rs. 10; boating from Therria Ghat to Chhatak Rs. 50; and Government royalty Rs. 20.

One thousand maunds of stone at Chhatak fetch from Rs. 125 to Rs. 130, and the cost of burning is from Rs. 120 to Rs. 150. A Chhatak maund of stone weighs 102 lbs. and yields one *phera*, or about 92 lbs. of slaked lime. The cost of 1,000 nominal maunds of slaked lime at Chhatak is thus from Rs. 245 to Rs. 280, and the price is said to vary from Rs. 290 to Rs. 400. Freight to Calcutta is from Rs. 200 to Rs. 230 per 1,000 maunds.

Potters are either Hindus of the Kumar caste, or Muhammadans called Khuskis who are
Pottery. regarded with some contempt by the main body of their co-religionists. The earth used is generally a glutinous clay, which is well moistened with water and freed from all extraneous substances. If it is too stiff, some clean coarse sand is worked up with it,

and a well kneaded lump of the material is then placed on the wheel, which is fixed horizontally and made to rotate rapidly. As the wheel revolves the potter works the clay with his fingers and gives it the desired shape. The vessel is then sun-dried, placed in a mould, and beaten into final shape with a mallet, a piece of hard earth called *balia* being held the while against the inner surface. It is again sun-dried, the surface is polished, and it is ready for the kiln. The collection of the clay and firewood, the shaping of the utensils on the wheel, and the stacking of them in the kiln, form the men's portion of the work, while the final polishing is entrusted to the women, who sometimes mould small pots with their hands without employing the wheel. The instruments employed are the wheel (*chak*), which is about three feet in diameter and rotates on a piece of hard pointed wood fixed firmly in the ground, the mould (*aihal*) a hollow basin about 16 inches long by $3\frac{1}{2}$ inches deep, the mallet (*boila*) and the polisher (*chaki*). The principal articles manufactured are water jars (*kalash* or *kalsi*, *ghat* or *sarai*), cooking pots (*kachli*, *kurai* or *patil*), larger vessels such as *hari*, *matka*, or *jula*, smaller vessels such as *sara*, *kai*, and *kalki*, cups, plates, and lamps. The potters also make clay images of the various deities which are painted in bright colours and worshipped at the various festivals, and small models of elephants and other animals which are used as children's toys. This branch of their art is said to be distinctly lucrative. A few villages in Habiganj are famous for large, strong, earthen vessels which are used for storing molasses, and the cooking pots of Bengaduba in pargana Bejura, and of Lukra in pargana Richi are in some request. The profits

of the business are said to be small, and the local pottery is being gradually ousted by a superior quality of goods imported from Bengal, and by metal utensils which are coming extensively into use. Rough glazed earthen ware cups of European manufacture and plates and dishes of enamelled iron are also taking the place of the Sylhet pots and vessels.

The brass and bell-metal industry is not of much importance. Its principal centres are at the district and sub-divisional headquarters towns, and at Badarpur, Nandanpur, Madhabpur, Akhailkura and Srimangal, but only about a thousand persons are supported by this trade. Bell-metal utensils are cast in moulds, but brass vessels are made out of thin sheets of that metal which are beaten out and pieced together. The implements of the trade consist of anvils of different sizes (*nehai*, *thammua*, and *amti*), hammers, pincers and chisels. The furnace is simply a hollow in the floor of the hut and the bellows are made of goats' skin. When it is desired to join two sheets of brass together, nicks are cut in one edge, into which the other edge is fitted, and the two are then beaten flat. A rough paste made of borax and *pain*, a substance which consists of three parts of sheet brass with one part of solder, is then smeared over the join. The metal is heated, the *pain* melts, and the union is complete. The principal articles manufactured out of brass are small flattish bowls often used as drinking cups (*lota*, *bati*), jars for holding water (*kalsi*), basins (*dabar*, *tagar*, *tasla*), and spoons (*hata*). From bell-metal are made lime boxes (*chunati*), cooking vessels (*ballai*), and cymbals (*kartal*).

Weaving is not practised as a home industry in Sylhet as it is in the Assam Valley, and the great mass of the rural population are dressed in the cheap fabrics of Manchester and not in home made cloth. The Jugi caste is strongly represented, but few of them now touch the loom, and such clothing as is produced is for the most part woven by Manipuris. In 1891, there were only 6,768 persons in the Surma Valley entirely supported by the weaving of cotton cloth, as distinguished from those who combined that occupation with agriculture, and, in 1901, there were only 5,009 persons in Sylhet whose principal means of maintenance was the loom. The whole question of weaving in this Province has been dealt with at great length in a monograph on the Cotton Fabrics of Assam published at Calcutta by the Superintendent of Government Printing, 1897. The system followed in the Assam Valley is described on pages 30 to 51, and this is the system adopted by the Jugis on such occasions as they think fit to return to their traditional occupation, and occasionally also by the Manipuris. An alternative Manipuri process is described on pages 77 and 78. In the absence of elaborate plans and diagrams, descriptions of mechanical processes of this character are extremely difficult to follow, and those curious in the matter should refer to the monograph in question. Any one who really wishes to understand the way in which the work is done would, however, be well advised to study the subject in person and on the spot. The following is a brief description of the more important local products of the loom. The *than* or *gilap* is a large stout cloth made of white cotton thread, and

used in the cold weather as a warm wrap. The ordinary size is 9 feet by 4 feet 6 inches, but it is sometimes 18 feet and even 36 feet in length and is worn double. The price ranges from As. 8 to Rs. 3. Other articles turned out are *chadars* or wrappers, *dhotis* or waist cloths, handkerchiefs, and napkins. The *fanek* is a garment worn by Manipuri women, which is fastened under the arms above the bust, and reaches to a little below the knee. It is made of green or dark blue thread with red and yellow stripes, and is sometimes embroidered with flowers in cotton or silk. The price varies from Rs. 2-8 to Rs. 7. The *khes* is a thick cloth either plain or striped, used as a coverlet for a bed, as a wrapper by men, and as a petticoat by women. *Kheses* are generally from 5 feet to 9 feet in length by 3 feet to 6 feet in breadth, and cost from As. 8 to Rs. 3. The Manipuris also weave cheap mosquito curtains which are sold for from As. 8 to Rs. 1-4-0 a set. Imported cotton thread is generally used, but the fact that at the last census 2,383 persons in Sylhet were shown as dependent upon spinning for their maintenance, indicates that the cotton grown in the hills is not neglected. Nearly all of these spinners, it need hardly be said, were women.

The eri silk worm is reared by Assamese immigrants who have settled at the foot of the
Eri silk. Khasi and Jaintia Hills, and by a few poor Namasudra widows, but the cloth produced is generally intended for home wear and very little comes to market. The worm (*attacus ricini*) derives its name from the eri or castor-oil plant (*ricinus communis*) on which it is usually fed. From 5 to 6 broods are usually

reared in the year, those which spin their cocoons in November, February, and May yielding most silk. When the female moths emerge they are tied to pieces of reed, and are visited by the males who are left at liberty. The eggs are hatched in the house and take from a week to 15 days to mature. As soon as the worms appear they are placed on a tray, which is suspended in a place of safety, and fed on the leaves of the castor oil plant. When fully grown, they are about $3\frac{1}{2}$ inches long and of a dirty white or green colour. After the final moulting, the worms are transferred from the tray to forked twigs suspended across a piece of reed, and, when they are ready to spin, are placed on a bundle of dried plantain leaves or withered branches which are hung from the roof of the hut. The matrix of the cocoon is very gummy, and the silk, which is of a dirty white colour, has to be spun, not reeled off. Before this is done the cocoons are softened by boiling them in water and a solution of alkali. Empty cocoons yield about three-quarters of their weight in thread.

Boat building has always been an important industry in Sylhet. Mr. Lindsay, who was

Boat Building.

Collector there in 1780, built one ship of 400 tons burden, which drew 17 feet of water when fully loaded ; and experienced considerable difficulty in navigating her to the sea. He also built a fleet of 20 ships, and sent them to Madras loaded with rice, on the occasion of a scarcity in that Presidency. The following account of boat building in Sylhet is taken from an account submitted by Mr. Luttmann Johnson in his General Administration Report for 1880-81 : " The subdivision of Habiganj possesses at least two kinds of boats not

found elsewhere, the *Lakhai Palwar* and the *Khawai* boat. The *Khawai* boat is, however, only a flat-bottomed "*saranga*," the simplest development of the dug-out canoe. The bed of the *saranga* is simply a curved dug-out, on which the sides of the boat are built up. The more elaborate boats are built on the lines of an imaginary keel, the two ends or "*Galais*" of which are propped up at the beginning, in the places they will occupy when the boat is finished. Great quantities of keels and half finished boats of *Jarul* (*lagerstroemia reginae*) wood are made at Habiganj for sale at Phandauk Bazar in the Tippera district, where there is a great mart for timber. The "*Barki*" boat of Panduah, which plies in the river from Chhatak to Therriaghat, at the foot of the Kháisi Hills, is also peculiar to the district." It is, however, nothing more than a flat bottomed canoe, of very shallow draught, which is used for transporting limestone over the rapids in the hills. The boats built in the Bala-ganj quarter of the district are more spacious, as they are much wider than the Habiganj boats, though not so long.

The following account of the carpentry of Sylhet is taken from the same source : " Wood
Workers in wood. sawing is carried on in many parts of the district, specially at Bhanga, a place on the eastern border of the district, at the town of Sylhet, and at Habiganj. The sawyers generally come from the Habiganj subdivision. From the wood thus prepared, beams, rafts, and posts of houses are made, as well as platforms, bedsteads, benches, stools, wardrobes, desks, almirahs, chairs, tables, &c. Some of these are made after Calcutta

models. The wages of a carpenter vary from As. 8 to As. 12 a day. The carpenters also make agricultural implements, namely, the clodcrusher, the plough, and the yoke. The Manipuris make the wooden shoes, which are so universally worn by natives, and the *baulas* or pegs, which pass between the great toe and the toe next to it to prevent the sandal from slipping off the foot. These shoes and pegs are exported to some extent. Dhakadakshin, a pargana in the east of the district, is famous for the wooden plates, *khanchas* or *barkoses*, and vessels, *charis* or *tagaris*, made there." Palanquins are made at Lashkarpur, Rajnagar, Langla, and Chapghat.

The best carpenters are Manipuris. and they often
Carving and children's toys. enrich the boxes and bedsteads they turn out with a little carving. Carving in ivory used also at one time to be a speciality of Sylhet town, but the art has unfortunately become extinct. Excellent children's toys are made from common wood. A wooden spindle, called *dokan*, is supported on two uprights, and is encircled by a piece of leather whose two ends are alternately pulled and relaxed by one of the carpenters, so that the spindle rotates with great rapidity. A rough hewn piece of wood is inserted in the hole at one end of the spindle, and the second man applies his gouge or chisel, which is supported on a rest called *pholi*. As the wood revolves he deftly and quickly fashions a peg, bowl, cup, top, or similar toy, and when the article is shaped applies the colour. This is imported from Dacca or Calcutta, the colouring matter being mixed with resin or lac, and the whole being of the consistency of a stiff putty. It

is applied in bands as the toy revolves on the spindle, and polished with a dry leaf. This colour does not come off when moistened, a property which is most useful in the case of children's toys. The best kind of paint costs Rs. 6 per seer, but a cheaper and much inferior quality can be obtained for Rs. 3. Chisels and gouges which are made locally cost from As. 10 to Re. 1. The price of a set of 25 toys is Rs. 1-4, and the makers are able to live in quite as good a style as that of the ordinary cultivator.

The cane and bamboo furniture of Sylhet is cheap and of a good quality, a serviceable
Cane work. chair costing as little as As. 6. Really good cane baskets are also to be obtained in the bazar, and the leaf umbrellas of Sylhet are quite a speciality. They are made of what is known as *chatta putti* (*licuala peltata*) on a frame work of bamboo, but, though they only cost about three annas each, they are being ousted by the imported article which is more convenient, in that it can be closed, and lasts much longer. Mats are of several kinds, the best quality being the famous *sitalpati*, which is made from the *murta* reed (*maranta dichotoma*), and is valued for its coolness and smooth texture. The finest quality of *sitalpati* is manufactured in pargana Chaualis and commands a fancy price. The *neuli* mats, which are made of split bamboo, are almost as fine as a coarse *sitalpati*, and last a good deal longer. The best varieties of this mat are manufactured in pargana Chapghat, but bamboo mats are usually made of a much coarser quality. Mats are also made from *nal* (*phragmites roxburghii*), a high reed

which grows in marshy country ; the fine kinds, which are called *chatis* or *maluas*, are used to sit or sleep on, the coarser varieties, known as *dhara*, *katia* or *chas*, are used for partition walls in houses, and are sometimes laid upon the cow shed floor. There is a considerable export trade in mats, and nearly 140,000 maunds weight of these useful articles are said to have been sent out of the district in 1902-03.

Tikiyas are made of powdered charcoal and cowdung by poor widows and are used in *hookah* smoking. Short wooden *hookah* stems are manufactured in Sylhet, and so also is the flexible variety which is adorned with silver thread. *Sola* pith is made up into artificial flowers, ornaments, and crowns, and the red powder, *abir* or *fagua*, which is used at the Doljatra festival, is prepared in pargana Taraf. Oil is expressed from mustard, linseed, sesamum or *til*, radish, and the castor oil plant. Linseed oil is used to mix with paint, and *til* is generally taken medicinally. Radish when intended to be used for oil is sown very thickly, there is hardly any root, and the oil is expressed from the seed. It resembles mustard oil with which it is always mixed. Castor oil is used as food and also as a medicine for the itch. Oil is also extracted from the coal near the bed of the Panatirtha in the Sunamganj subdivision and is used as a remedy for skin diseases. *Patas* or stone pestles, and slabs used for pounding curry are made in Jaintia, and *daos* inlaid with gold at Rajnagar in the South Sylhet subdivision. *Ghi* and cheese are manufactured in Sunamganj and Nabiganj. Gold and silver ware is

manufactured, but the articles produced have no conspicuous merit. Many of the goldsmiths are Manipuris, but there are a certain number of Sylhettis, up-country men, and natives of Dacca, the last named being the most expert of all. There is one saw mill in the district at Bhanga Bazar, a station intermediate between Karimganj and Badarpur. In 1903, this mill gave employment to some 50 persons.

The fishing industry in Sylhet and is a source of no little revenue to Government. In 1902-03 the total receipts under this head amounted to Rs. 66,900, and were distributed as follows: Sunamganj Rs. 5,500; North Sylhet Rs. 26,600; Karimganj Rs. 20,100; South Sylhet Rs. 2,100; and Habiganj Rs. 12,600. Though the receipts from Sunamganj are comparatively small, it is the most important centre of the industry, as there are valuable fisheries in the permanently settled estates. The Subdivisional Officer estimates that as much as 500,000 maunds of dried fish are exported annually from this portion of the district. The fish are cut open, the viscera removed, and the flesh exposed to the sun on bamboo platforms. When dry fish oil is poured over them, and they are buried near the homestead till the time has come for despatching them to market. There is also a large trade in live fish, which, according to the Subdivisional Officer, amounts to some 100,000 maunds. They are carried to their destination in boats, the bottoms of which are filled with water which has to be changed every twelve hours. Fish oil, which is used as an illuminant in lamps,

is obtained by frying the viscera, and soaking the head and flesh in water, when the oil rises to the surface. There is not much export trade in fish from the other subdivisions except from the *Son bil* near Karimganj, whence fish is exported to Hailakandi; and from the *Hakaluki haor*, whence it is sent by rail to the North Cachar Hills. The castes who are engaged in the industry are the Mahimals, Namasudras or Chandals, Dom Patnis, Kaibarttas and Bhuinmalis. Members of the higher castes catch fish for their own consumption but not for sale.

Public fisheries are sold at auction to a middleman who makes the actual fishermen pay, either a fixed sum for each fishing house or village, or, more generally, a fixed sum for every net or trap employed. Typical rates are Rs. 30 for each *uthar jal*, Rs. 6 for a *jhuki* or *loya jal*, Rs. 4 to Rs. 6 for a *kheo jal*, Re. 1 for a *pelain*, and As. 4 for a *polo*, *hagra*, or other bamboo trap. In the *Hakaluki haor* Government levies a certain charge for each net or basket used, but in the channels leading to this and other *haors* there are regular fixed fisheries called *kheos*, which are openings cut in the jungle at right angles to the stream, in which a stake net can be placed. In the Jaintia Parganas many of the Government fisheries put up to auction are *bils* or swamps; elsewhere they are generally sections of the numerous rivers with which the country is intersected. The most valuable fishery is the *Hakaluki haor* which brings in a revenue to Government of from ten to eleven thousand rupees a year. In Habiganj fishing rights in $5\frac{1}{2}$ miles of the Kalni river, from

the Bibisana river to the Kusiya, fetch as much as Rs. 3,500 per annum, while a section of the Bibisana, $2\frac{1}{2}$ miles in length, was sold for Rs. 1,700. The Chatla *bil* in Karimganj fetches about Rs. 1,000. Most of the Government fishery revenue in North Sylhet is derived from the Jaintia Parganas. The best eating fish are hilsa (*clupea ilisha*), roe (*labeo rohita*), butchua (*eutropichthys vacha*), pufta (*callichrous bimaculatus*), magur (*clarias magur*), kai (*anabas scandens*), katal (*catla buechanani*) and chital, soul and prawns.

The following are the nets most commonly in use :

Nets used. *Bhar Jal*.—Cost Rs. 16. A square net each side of which is about 24 feet in length. The two corners at one end are fastened a little above the water to two posts driven into the bed of the fishery 24 feet apart. The other end, to which ropes are attached, is allowed to sink in the water and is then drawn up with any fish that may have chanced to be swimming over the net at the time.

Dal Jal.—Cost Rs. 80 to Rs. 100. A stake net which is used to enclose a piece of water to which the fishes have been attracted by artificial cover formed from the boughs of trees.

Galfa or Ghona or Ber.—Cost Rs. 30 to Rs. 40. A net about 100 feet long and 10 feet deep which is allowed to float in a vertical position down stream, the top edge being buoyed by hollow bamboos. The fish, which swim faster than the net is floating, are caught in the meshes as they try to force their way through.

Ghatghati Jal.—Cost Rs. 10. This net is used by two men, each of whom takes one of the top corners in his left hand and ties the corresponding lower corner to his left foot. They walk out into the fishery till the net is in the form of a semi-circle, while their friends beat the water in the neighbourhood to drive the fish into the space enclosed. The men then meet and the fish are unable to escape.

Hefa Jal.—Cost Rs. 3 to Rs. 5. A triangle of bamboos filled with netting and fitted with a handle. It is used much as a shrimping net. The *pelain* is a smaller variety of this net and costs Re. 1. The *heka jal* is a net of the same kind used in rivers, and the *jhinti jal* one which is also used in *bils*.

Hera.—Cost Rs. 2 or Rs. 3. A rope which is used to catch the *ghagal* fish which always remains close to the bottom of the river or *bil*. The rope is dragged along the bottom, and the fish, when it feels it, retires before it and thus is guided towards the bank.

Hura Jal.—Cost Rs. 6 to Rs. 10. A long net, one end of which is tied to a post in a *bil* and the other held by the fisherman. He takes it out to its utmost limit and encloses a piece of water, catching all the fish which are inside.

Jhaki.—A flat circular piece of netting with a cord attached to the centre. The circumference is weighted with lead and the edge is turned up so as to form a series of deep pockets. The net is thrown so as to fall flat on the surface of the water, the weights pull the outer circle

down and together, and any fish inside are entangled in the pockets.

Khati.—A species of net or screen made of split bamboo and twine. A piece of water is enclosed by this net, which is then brought gradually towards the bank.

Kheo Jal or Shitkar.—Cost Rs. 4 to Rs. 8. A square net, the opposite corners of which are fastened together with pieces of bamboo. The net thus hangs like a sack from the pole to which it is attached, and is lowered into the water and raised again.

Maha Jal.—Cost Rs. 300 to Rs. 500. This net is something like the *galfa*, but instead of being allowed to drift down stream, it is arranged parallel to the bank and drawn towards it.

Sakubel.—Cost Rs. 20. A triangular net the two sides of which are fastened to two bamboos joined at the apex. A little above their junction the bamboos are fastened to two stout posts on which they work on a pivot, and the base of the net is allowed to sink into the water. Pressure is then applied to the apex and the net and its contents are raised into the air. The *sakubel* is a large net the two sides being about 48 feet long and the base some 24 feet.

Sanga.—Cost Rs. 2. A net like a large pocket, about 24 feet across. The mouth of the pocket is fitted with two bamboos to which cords are attached, and the net is sunk in the stream facing the current. As soon as a fish enters the pocket the man slackens the cord attached to the upper edge of the mouth and pulls the lower edge

upwards so that the pocket is closed. Smaller nets of the same shape are the *loya jal* and the *ilish jal*. They are kept nearer the surface of the water than the *sanga*.

Uthar Jal—Cost Rs. 80 to 125. A large kind of *jhaki* which is too big to throw and is gradually laid out from two boats. This net is made in meshes of different sizes, the largest size mesh is called *reg*, the next size *saphaya*, while the smallest of all is known as *bachaot*.

Fish are also caught in traps made of split bamboo, the doors of which open inwards so that the fish can shove them open from without, but cannot pull them open from within. They are of different shapes and are known as *kuin*, *bair*, or *dari*, *gui*, *paran* and *runga*. The *hagra* is a cone shaped wicker work basket open at one end only, and filled with brushwood in which small fish take shelter. It is sunk in the bed of the river and pulled up every twelve hours or so. The *chunga* is simply a hollow bamboo with holes in it, and is used in the same way as a *hagra*. Another device is the *datia* which is a split bamboo, the two ends of which are fastened in an insect and tied together with a piece of twine. The fish swallows the insect and the twine, the two ends of the bamboo spring apart, and the fish is unable to close its mouth. Another method of catching fish is to spear them at night with a trident called *attar*, when they are dazzled by the glare of a torch in the front of the boat. The ordinary fish spear is called *kucha*, but when the head is fastened by a piece of cord to the shaft and remains in the body

of the fish, it is known as *jhaqar*. Small fry are caught in the *polo*, a species of conical basket which the fisher dabs down before him as he walks along the *bil*. If he feels a fish inside he puts his hand in through the top and removes it. A long tube shaped basket used to catch the *kai* fish and worked on the same principle as the *polo* is called *jhupri*.

About 25 years ago lac was produced in considerable quantities, but the industry is now in a very languishing condition. The insect is reared on the banian (*ficus indica*), but, for reasons which the cultivators have not yet succeeded in discovering, it no longer thrives upon this tree. The only places in which it is now produced are parganas Bhaterah, Baramchal, Langla and Kanaihati in the South Sylhet subdivision. Two crops are generally obtained in the year, the first being collected in May and June, the second in October and November. The first crop is largely used for seed.

CHAPTER VI.

ECONOMIC CONDITION OF THE PEOPLE—COMMUNICATIONS— TRADE—TOWNS AND LOCAL BOARDS.

Subtenancy—Rates of rent—Rent law—Subtenancy in Jaintia—Subletting in the *ilam* estates—Wages—Prices—Food and dress—Houses and furniture—Economic condition of people—Social restrictions—Railway—Navigable rivers—Boat traffic—Roads—Post and Telegraph—Trade—Towns—Local Boards.

There are no statistics of subtenancy available for the permanently settled portion of Sylhet, but the figures in the margin,

Subtenancy.		
Percentage of ordinary cultivating classes who were—		
	1901.	1891.
Landholders ..	39	34
Tenants ..	70	60
Cultivators unspecified ..	1	6

which are taken from the Census Reports of 1891 and 1901, suggest that more than half of the total area of the district is sublet. The bulk of the estates created at the time of the permanent settlement were so small that there has been no room for the growth of the intermediate tenures which are so common in Bengal. Many of the actual settlement-holders drive the plough themselves, while the others let their land direct to the cultivator, and from the rent he pays them satisfy the Government demand.

In spite of the density of the population rents as a rule are fairly low, the ordinary rates charged ranging from As. 12 to Rs. 6 per acre ; though good land in Habiganj and the most densely settled portions of the district will fetch as much as Rs. 12 or Rs. 15 per acre. The great majority of the landlords are small men, and have not the resources

Rate of rent.

or influence which would enable them to coerce refractory tenants ; and, though there is considerable pressure on the land, the difficulty of realizing the demand acts as an effectual check upon any tendency to rack renting.

The tenants are protected by Act VIII (B. C.) of 1869, which confers a right of occupancy upon any person who has held his land for a period of twelve years. The rent of such land is then not liable to enhancement, except on the ground that it is below the rate prevailing for similar land in the vicinity, that the value of the produce or the productive powers of the land have been increased otherwise than by the agency or at the expense of the raiyat, or that he holds a larger area than that for which he has hitherto been paying. The relations between landlord and tenant are said to be fairly satisfactory. The average number of suits annually instituted in Sylhet under the rent law during the four years ending with 1902 was 4,057, but the immense majority were for sums that did not exceed Rs. 50.

In the Jaintia Parganas, for which more accurate statistics are available, most of the cultivators hold direct from Government. At the settlement which took effect in 1896, it was found that out of a total settled area of 215,000 acres only a little more than 7 per cent. was held by subtenants, who formed a little less than 7 per cent. of the total population. These tenants fell into four classes. The majority paid rent in cash at rates which varied from Rs. 7-8 to As. 6 per acre of cultivated land. The

former rate is fairly high but from the small proportion of land sublet it seems fairly clear that the higher figure must be quite exceptional. Of the 8,104 subtenants only 268 paid rent in kind, the amount given to the landlord being usually less than one-third of the total produce. Other villagers, though the number is probably but small, hold their land either on a service tenure, or discharge their obligations partly in cash partly in labour.

The proportion of land sublet in the Ilam estates, the bulk of which are found in the **Subletting in the Ilam Estates.** South Sylhet and Karimganj subdivisions, is considerably higher. Out of a total area of 35,500 acres cultivated with ordinary crops nearly 42 per cent. is sublet, at rates varying from Rs. 8 to As. 6 per acre of rice land. Both of these are, however, exceptional rates, and the ordinary rent taken ranges from Rs. 2 to Rs. 3 per acre.

The labouring classes are for the most part recruited from the ranks of the humbler Hindu **Wages.** castes such as the Dom-Patnis, Malos, Namasudras, Malis, and Jugis, and the poorer Muhammadans, but even members of the Halwa Das caste will consent to act as ploughmen. Four annas a day appears to be the usual labourer's wage. The minimum is reached in Sunamganj, where men can sometimes be hired for 2½ annas, but, in all parts of the district, reapers at harvest time, house-builders, and load carriers are occasionally paid as much as As. 8 a day. In parts of the district there is a prejudice against carrying loads or

palkis for hire, and men who will plough and reap or help to build a house, object to being employed as beasts of burthen, in spite of the fact that for centuries all goods taken by land have been carried in this manner. There is a still stronger prejudice against working on the roads, and most of the repair work has to be entrusted to Nuniya coolies from Bengal. Servants are paid from Rs. 2-8 to Rs. 4 a month with board and clothing, and if they feed themselves generally receive from Rs. 6 to Rs. 8 per mensem. Difficulty is said to be experienced in obtaining both servants and daily labourers, but, in comparison with the Assam Valley, Sylhet is well supplied with people ready and willing to work for hire. The proportion of the population of the district supported by general labour is, however, only 1 per cent. as compared with 7 per cent. in the neighbouring Province of Bengal.

Rice is the staple food crop of the district, but the price at which it sells is largely affected by the condition of the harvest in Bengal. In the early years of British rule, the market was liable to violent fluctuations. This was not due to the want of proper means of communication, as the waterways of Sylhet and Eastern Bengal were as good then as they are at the present day. But the same facilities did not exist for a foreign export trade or for the despatch of grain up-country, and, when there was a bumper harvest in Sylhet, there was doubtless little or no demand for rice in those districts of Bengal which were accessible by water. The lowest price recorded was in 1786, when rice was selling at the rate of four and a half maunds

Prices.

to the rupee, a price which hardly paid the cost of bringing it to market. Two years later it was up to Re. 1-8 a maund, but the normal price at the end of the eighteenth century seems to have been from 10 to 12 annas a maund for husked rice, and 5 to 6 annas for unhusked rice or paddy.

The last forty years have witnessed a steady rise in price, the average amount of common rice obtainable at Sylhet for a rupee during each of the four decades between 1863 and 1902 being 25 seers, 21 seers, 16 seers, and 13 seers. But though the general tendency has been upwards, the chart, like that of the thermometer at Quetta, shows the most violent oscillations. In 1864, the market rate was 31 seers, but two years later it had risen to 13. In 1872, it was back to 38 seers, but in 1879 it had jumped up to 11, only to fall again three years later to 37 seers for the rupee. Only once since 1882 has the price been less than Rs. 2 a maund, and this was in 1888. The highest rate on record was in 1897 when only 9 seers could be purchased for the rupee; the lowest in the last fifteen years was 1899 when the same sum brought in nearly 20 seers.

Communications on the whole are good, and the price of grain is fairly uniform throughout the district. The general tendency is for it to be highest in the South Sylhet and Karimganj subdivisions, where there is a considerable garden population, but this is merely a tendency and not an economic law, and rice is sometimes cheaper there

* Rise in price during past 40 years, but progress very irregular.

Prices fairly uniform.

than in Habiganj or North Sylhet. In May 1899, the price was recorded at twenty-four bazars in different parts of the district. The average was Rs. 2-2-1 a maund, and fifteen out of the twenty-four bazars were within two annas of this mean. The two extremes were Rs. 2-10-0 per maund at Durlabchara Bazar in Karimganj, and Rs. 1-11-6 per maund at Munshi Bazar in South Sylhet. Salt does not vary much in price from year to year. In the ten years ending with 1880, 8·7 seers were on the average procurable for one rupee. From 1882 to 1887, salt was cheap and the average for that decade was 11 seers; but the average for the next ten years dropped to 10·1. In 1902, 10·4 seers were procurable for a rupee. Pulse also does not vary very much in price, and since 1900 has kept fairly steady at 13 seers for the rupee.

The price of rice, salt, and pulse in 1900 and subsequent years will be found in Table IX.

The ordinary food of the villager is boiled rice, seasoned with spices or mixed with dal, or fish, or vegetable curry. Pigeons and ducks are occasionally eaten by the well-to-do, and in the west of the district rams are sometimes fattened for the table. The Muhammadans take fowl and, when they can afford it, beef. Cheese is sometimes eaten by the upper classes, and curds (*doi*) and fresh milk which has been coagulated by the addition of a little tamarind juice (*chhana*) are thought a dainty dish. Sweetmeats are made of flour or powdered rice mixed with *ghi* or oil, and sugar. Tea is comparatively seldom taken.

The clothing of an ordinary villager consists of a *dhoti* or waistcloth which costs 12 annas, and of which he will probably use four in the year, and two sheets which cost a rupee each. He also sometimes wears a small cotton coat which costs about 12 annas. A winter wrap costs Rs. 4 and lasts about two years, so that a man expends some seven or eight rupees each year upon his wardrobe. A woman wears a single garment—the *sari*, a long piece of cloth which is wrapped round the waist to form a petticoat and then thrown over the bust. It costs about 12 annas, and three or four are wanted every year. Amongst the upper classes chemises and bodices are coming into use, but the wife of a clerk can still dress on about eight rupees a year.

The cottage of the ordinary cultivator is built on a mud plinth, and the floor, though cool, is damp. The roof is of thatch, the walls of reeds plastered with mud, or of split bamboo, the frame-work of the house of bamboo. There are no windows, and the interior of the hut, which in itself is small enough, is rendered additionally dark and stuffy by partition walls. The houses of the middle classes differ in quantity and quality but not in kind from those of the ordinary villager. While a poor peasant will content himself with a single hut his wealthier landlord will have five or six. They are larger and better built, timber posts are sometimes used in place of bamboo, and corrugated iron instead of thatch, but the principle remains the same. Masonry houses are extremely rare. The furniture of the villager consists of a wooden bed, a stool or two, and, if the man is fairly well-to-do, of

Houses and furni-
ture.

some wooden boxes and perhaps a chair. For bedding he has a dirty quilt made of old clothes, and his wardrobe is not distinguished either for the abundance or the excellence of his garments. Rough earthenware crockery of European manufacture and plates and dishes of enamelled metal are in common use. The poorer people sleep on a mat on the floor, but there are few houses in which a mosquito curtain is not to be found. Of actual poverty there is very little. The clothing of the cultivators though simple is all that is required at most seasons of the year, and there are probably few natives of the district who ever go in want of food. For the insanitary character of their homesteads the occupants are themselves chiefly to blame, and though there are few signs of wealth there is an equal absence of any evidence of grinding poverty.

The economic condition of the people is obviously a subject of much interest and importance, but it is one with regard to which it is extremely difficult to obtain information on which reliance can be placed. The peasant in Sylhet has no desire to minimise his obligations, or to pose as a prosperous and wealthy person, and the reports that are received largely reflect the personal idiosyncracies of the individuals consulted. Indebtedness is said to be extremely common. There are few areas in which less than one-fourth of the total population are said to be involved, and in the west of Habiganj, in the Baniyachung, Lakhai, and Madhabpur thanas, and in parts of Karimganj, practically all the people are described as being in debt. On the other hand

Economic condition of the people. Indebtedness and rate of interest.

in Muchikandi, adjoining Madhabpur, the proportion is reported to be as low as 25 per cent. It is true that this locality is less exposed to flood than Madhabpur, but it seems unlikely that there should be so marked a variation in the condition of the people inhabiting contiguous thanas, and there can be little doubt that these estimates of indebtedness must be received with a considerable degree of caution. In view of the high rate of wages paid for manual labour and the small proportion of labourers in Sylhet, it is not easy to believe that there is really much of genuine poverty. The rate of interest ranges from 18 to 75 per cent., the lower rates being charged on loans of considerable sums. When paddy is borrowed, the debtor undertakes to return double the amount or half as much again after the next crop has been harvested ; and, as the loan is generally made for but a short period, the rate of interest is very high. Marriage, *sradh* ceremonies, litigation, and the purchase of cattle are the causes which generally drive the peasant to the money-lender.

It must be admitted that in the north-western corner of the district the conditions are not altogether favourable. Almost the whole of the country goes under water in the rains, there are no tea gardens, and little demand for labour except in connection with the lime industry. The Superintendent of one of the largest zamindaries in Tahirpur describes the people of that quarter as being "the most miserable lot of wretches on God's earth." On this the native Magistrate remarks, that had this gentleman, who is a native of the extremely

Economic condition of Sunamganj somewhat unsatisfactory.

prosperous district of Backerganj, been acquainted with the condition of the peasantry in parts of Madras, Bihar or the Central Provinces, or, indeed, it may be added, in many parts of the world outside India, he would probably have couched his opinion in more moderate terms. The floods are so high in this portion of the district that the majority of the people depend on one rice crop, the *boro*, which is reaped before they rise. When the country is submerged a large portion of their time is devoted to the collection of fodder for their cattle which sometimes has to be brought from a considerable distance ; but, apart from this, they have little or nothing to do for a great portion of the year, and there can hardly be much prosperity where there is very little work.

The officer in charge of the Sunamganj police station states that it is unsafe to conclude that, because the lower orders decline to undertake menial work, they are necessarily well off. He draws a somewhat gloomy picture of their condition and describes them as " in need of almost all the necessaries of life, ill-fed, ill-clothed, and badly housed. They cannot stand against a single drought or failure of crop, and cannot undertake any work requiring even a small outlay, without applying for a loan. Yet their habitual laziness and race pride precludes them from doing work by which the people of other parts are raising their status before their eyes. They practically have no margin to enable them to struggle with success against even one season of scarcity, can perform no marriage or *sradh* without a loan, and cannot even purchase a pair of bullocks without going

to the usurer." This picture also would seem to be painted in too gloomy colours. Deficiency of food is practically unknown, their clothing though poor is not unsuited to the climate, and their dietary, though unattractive to the European palate, is what they apparently prefer.

In the Fenchuganj thana, it is said that the standard of comfort is higher than it was. Metal utensils have taken the place of earthenware, gold and silver ornaments are worn in place of lac and brass, carpet bags have come into use, and the leaf umbrella has been displaced by the product of the European factory. In South Sylhet and Karimganj, the great majority of the villagers are said to be in debt, but it is difficult to believe that the condition of the people is really quite as unsatisfactory as is alleged.

Little light is thrown on this important subject by the settlement reports. With regard to indebtedness in the Jaintia Parganas the Settlement Officer quotes Babu Prakash Chandra Datta who writes as follows :—

"The tales of indebtedness and living from hand to mouth in the statements recorded are common, but in most cases these are false and exaggerated, as strict enquiries have elicited, and are due to the peculiar fondness of Jaintia people to abstain as much they can from giving accurate information on matters in which they are interested. Of course, instances of real indebtedness are not wanting, as can be naturally expected, but the loans are generally contracted for marriages, religious ceremonies, for litigation, and rarely to buy cattle and to pay revenue. The majority of the real borrowers, it will be seen from the evidence recorded, are those who own larger areas

of land than are needed for their requirements or than they can cultivate, which they will not throw up, although obtaining no profit therefrom, because their forefathers held such an amount of land, and they will lose their prestige if they are to abandon it now ; or those who from a consideration of their social rank think it derogatory to work for hire when in need."

At the last resettlement of Ilam lands the Settlement Officer collected information with regard to the indebtedness of certain villages in the neighbourhood of Patharkandi. Here out of 393 householders 208 owed on the average Rs. 100 each, while in another village there were 81 debtors who owed altogether nearly Rs. 14,000 between them. Patharkandi is, however, situated in one of the less prosperous portions of the district, and it is difficult to believe that indebtedness is quite so prevalent or so serious in every part of the district as these figures would suggest, though the general impression of the native officers consulted is that it is very common.

As compared with the parts of India that are liable to famine the people of Sylhet are undoubtedly well off. The rainfall never fails, and, though a heavy flood occasionally does damage, the harvest is usually abundant and secure. Their surplus produce is sold direct to traders from Bengal, who can penetrate in their boats into almost every corner of the district, and there is no middleman to absorb a large share of the producer's profit. The villagers generally take three meals a day of cooked rice, and fish can be obtained without difficulty at all seasons of the year. They decline to work on tea gardens or on the roads, and actual poverty seems to be extremely rare. In some

General condition fairly satisfactory, though in some respects the Sylhetis are less fortunate than the Assamese.

respects, however, they compare unfavourably with the Assamese of Sibsagar and Lakhimpur. Their houses are better built, but owing partly to the scarcity of materials, partly to a dearth of land suitable for building sites, they have less room space per family than the Assamese. Silk, which is so common in Assam, is hardly ever worn by the cultivators in Sylhet, and such ornaments as they possess are in no way comparable to the costly locket and ear-rings of Jorhat. The houses are generally crowded together in uncomfortable proximity, and in the flooded thanas on the west fruit trees and garden produce are unknown. In the central portion of the district bamboos are plentiful, and there may be a mango or jack fruit tree and a few plantains, but there are no dense groves of betel nut, and vegetables, tobacco, and such like crops are not generally grown. Further south and east, the garden land improves, and the areca palms of Karimganj must be a source of considerable profit to their owners. Several causes operate prejudicially against the villager. In parts of the district there is a certain amount of pressure upon the land, and the people would be more prosperous were it possible for them to extend the area under cultivation. In Assam, the womenfolk of the ordinary peasant do most of the transplanting of the paddy, and help in the harvesting of the rice, and in their leisure moments fish, or weave on the loom enough clothing to satisfy the family requirements. In Sylhet, the women are not allowed to go abroad, and weaving as a domestic industry is practically unknown. The peasant's clothes have to be purchased with hard cash and are not as warm or durable as those worn in the valley of the Brahmaputra.

There are few restrictions on trade other than those imposed by the great law of caste.

Social restrictions on trade and agriculture. Dom-Patnis, Kaibarttas, Namasudras, Mirdhas, and Mahimals alone sell fish ;*

Sunris alone sell wine ; Jugis alone weave cloth ; Kumhars alone make pottery and so forth. In the Dharmapasha thana, in Sunamganj, Saturdays and Tuesdays are considered unlucky days for a first ploughing or for sowing seed, bamboos must not be cut on Sundays or cattle sold on Monday. On the other hand, further east in the Sunamganj thana, Tuesdays and Saturdays are said to be the best days for sowing *boro* seed, while Sundays, Wednesdays, Thursdays, and Fridays are set aside for *aman*. Bamboos must not be cut on Sundays or Thursdays, houses built on Sundays, or money and paddy lent on the days of the new and full moon and the following days. In Baniyachung, people will not sell rice on Wednesdays and Sundays ; and the former day is considered by Muhammadans in most parts of the district to be unfavourable for any undertaking. All over the district, the last day of the month and the day of the new moon are considered inauspicious. In Jaintia, the villagers will not begin ploughing on Sundays or sowing on Mondays, or cut bamboos on Thursdays and Sundays, but in the eastern portion of the district less regard seems to be paid to inauspicious days.

There are four means by which goods are generally transported in Sylhet ; the railway, the steamer, the country boat, and the

Means of communication : Railways.

* In Madhabpur thana the Tiyars are the only caste who will sell anything less than whole fishes.

cooly. The cooly seems an anachronism as a beast of burthen, for the district has for the last twenty years been possessed of several hundred miles of excellent unmetalled roads, but, though the roads are there, the people have not yet realised the utility of carts. The Assam-Bengal Railway enters pargana Kasimnagar in the south-west corner of the district at mile 135 from Chittagong, and leaves it at Badarpur at mile 253. It skirts the Raghunandan hills, crosses the low ranges of Satgaon and Balisira, passes, like the river Manu, between the Rajkandi and Ita hills, and runs near the western base of the Langla and Pathariya hills northwards to Karimganj. From this point it keeps fairly close to the left bank of the Kusiara river till it reaches Badarpur, where the main line crosses the river, here known as the Barak, by a magnificent bridge, and turns north through the Assam Range into the Brahmaputra Valley. A branch line continues along the left bank of the river as far as Silchar. Work was begun on the railway in 1892 and the line was declared to be open for traffic as far as Silchar in 1899. The names of the stations going from west to east are Chandura at mile 137, Mantala at mile 142, Itakhola at mile 147, Shahji Bazar at mile 155, Saisitaganj at mile 160, Daragaon at mile 166, Rasidpur at mile 168, Satgaon at mile 175, Srimangal at mile 179, Alinagar at mile 187, Shamshernagar at mile 191, Tilagoan at mile 197, Kulaura at mile 205, Juri at mile 212, Dakhinbhag at mile 216, Barlekha at mile 222, Latu at mile 229, Langai at mile 238, Karimganj at mile 239, Chargola at mile 243, Bhanga at mile 247, and Badarpur at mile 252. The railway passes near many of the tea gardens and carries

a considerable proportion of the tea crop of the district. The stations from which the largest quantities are booked are Srimangal, Shamsheernagar, Langai, and Chorgola.

It has already been explained that the principal river of the district is the Barak, with its two main branches—the Surma and the Kusiya—the latter of which is again subdivided into the Bibiyana or Kalni and the Barak. The Kusiya arm is the route by which through traffic goes up the Surma Valley from Calcutta to Silchar, but the extent to which this river can be used depends upon the season of the year and the amount of water in the channel. During the rains big steamers come up from Calcutta and call at the following stations:—Ajmiriganj, Markhali, Enathganj, Sherpur, Manumukh for Maulavi Bazar, Balaganj, Fenchuganj, which is the company's headquarters in Sylhet, Nahair Ghat, Bairagi, Sheolamukh, Lakhi Bazar, Karimganj, Bhanga Bazar, and Badarpur. Small steamers run up the Surma from Markhali past Sunamganj and Chhatak to Sylhet town. In the cold weather, the big steamers go right up to Chhatak, but beyond that point there is not enough water in the Surma for steamer traffic during the dry season. Through traffic continues to go from Markhali to Silchar but small feeder steamers have to be employed. During the rains small steamers also run up the Manu to Chatlapur, up its tributary the Doloi to Kurma, and up the Langai from Karimganj to Langai Ghat.*

* These steamers are owned and managed by the India General Steam Navigation Co., whose managing agents are Messrs. Kilburn and Co., 4, Fairlie Place, Calcutta, and the Rivers Steam Navigation Co., whose agents are Messrs. McNeill and Co., 2-1, Clive Ghat Street, Calcutta.

In a district like Sylhet, where the fall is very slight and the current sluggish, it is inevitable that the rivers should silt up their beds. This process is apparently going on with greater rapidity in the Surma than the Kusiara. In 1872, a large shoal formed a little below Sylhet and for the next ten years the attention of the local authorities was directed towards the question of improving the through water communications of the district. The Deputy Commissioner, Mr. Luttmann-Johnson, made two trips up the Surma in a small steamer, and after a careful examination came to the conclusion that the river to open out was the Kusiara and not the Surma. The cost of clearing the latter stream would have been very heavy, and it was not the direct route for the through traffic to Cachar. *

The greater part of the trade of the district is, however, carried not by steamer but by country
Boat traffic. boat. During the rains the *haors* and channels are filled with water, and these lumbering vessels with their light draught are able to leave the regular rivers and take shorter and more expeditious routes across the country. From Lakhai they go straight to Habiganj and then turn north-east through the Gungijuri *haor* between the Barak and the Satgaon hills. At the northern end of this *haor* the traffic divides, and boats for Balaganj, the Manu, Karimganj, and Cachar, join the Barak just below Bahadurpur. From here to Balaganj the boats keep to the river, but between Balaganj and Karimganj there are numerous short cuts.

* *Vide* Deputy Commissioner's General Administration Report for 1880-81.

Boats going towards Sylhet leave the Gungijuri *haor* at Nabiganj, and travel due north to Enathganj and Haripur Bazars. From there they go by the Itakhola and Babna rivers, past Biswanath Bazar and Lala Bazar to Tukur Bazar, where they enter the Surma a little below Sylhet. The down traffic keeps of course more close to the rivers to get the benefit of the current, but the up traffic not only has the advantage of the short cuts outlined above, but generally also has the wind behind it.

In addition to the various navigable rivers, details for which are given in the statement appended to this chapter, there are two important channels which connect or nearly connect the Surma and the Kusiara. Except when the river is at its lowest, travellers from Cachar to Sylhet can avoid the Kanairghat loop of the Surma by proceeding down the Kusiara to a place about fifteen miles below Karimganj, which is connected by a navigable channel with the Surma. During the rainy season, too, it is possible to boat from Fenchuganj *via* the Korkuchi khal, the Hailka Barna *haor*, the Khesab khal, the Basudeb khal, and the Tola khal to a point about two miles south of Sylhet town.

Under native rule there was not a single high road in Sylhet, and the district depended on its numerous waterways for the transport of internal trade, and for communication with the outside world. Mr. Lodge reported in 1794 that the only roads in the districts were those in Sylhet town, which had been made by his predecessor at his own

Road system.

expense, and were kept in repair at Mr. Lodge's own cost. Since that date the condition of affairs has been completely altered and the district is now well supplied with highways, though during the rainy season journeys are generally made by boat. At the present day there are 120 miles of road maintained by the Public Works Department, and nearly 1,200 miles of main and secondary roads kept up by the Local Boards, details for which are shown in the following statement:—

Name of Local Board.	Mileage of main roads.	Mileage of secondary roads.	Cold weather tracks, &c.	Total.
North Sylhet ...	143	35	238	416
Sunamganj ...	29	16		45
Habiganj ...	121	36	114	271
South Sylhet ...	155	118		273
Karimganj ...	121	51		172
Total ...	569	256	352	1,177

None of the main roads are metalled, but they are raised well above flood level, and as there is very little cart traffic, they are not much cut up even in the rainy season. The smaller rivers and streams are crossed by bridges, which are generally of a permanent or semi-per-

manent nature; though bamboo structures are still occasionally to be found and are always used on the cold weather roads. The larger rivers have to be crossed in ferry boats.

One of the principal thoroughfares is the road from Sylhet to Cachar which runs close to the left bank of the river Surma as far as Ramda, where it turns south to Karimganj and leaves the district at Badarpur forty miles from Sylhet town. This is, however, a new alignment and the old road, which is still kept in repair, kept close to the bank of the Surma the whole way from Churkhai to the junction of that river with the Kusiara. Both the old and the new road are fit for wheeled traffic throughout the year, and there are inspection bungalows at Golapganj, Ramda, and Sheolamukh at the 11th, 18th, and 23rd mile from Sylhet, and dak bungalows at Karimganj and Badarpur. Most of the bridges are of a permanent or semi-permanent character, but even in the dry season there are four ferries to be crossed—over the Surma at Sylhet, over the Kusiara at Sheolamukh and Karimganj, and again over the Surma at Katagang. Westward this road is continued to Sunamganj, a distance of 41 miles. It is fit for wheeled traffic during the cold weather as far as Govindganj, but in the rainy season goods and passengers alike go by the Surma river and local pedestrians alone are likely to use the highway. Inspection bungalows are maintained along this section of the road at Govindganj, Pagla, and Kaitak, which are situated on the 14th, 22nd, and 30th mile from Sylhet respectively.

North Sylhet
roads.

North of the town, a cart road runs 17 miles to Companyganj, crossing ferries at Salutiker, and at Companyganj where there is an inspection bungalow. Prior to the earthquake, a small railway ran from Companyganj to Therriaghat at the foot of the Khasi Hills ; but this line was wrecked by that terrible convulsion of nature, and there is now only a bridle path which is hardly fit for use during the rains. At this season of the year, travellers from Cherrapunji generally go by boat from Therriaghat to Chhatak, and thence by steamer to Sylhet. Another road runs north-west from Sylhet to Jaintiapur. As far as Haripur, where there is an inspection bungalow, 14 miles from Sylhet town, the road is drivable throughout the year, but here the level sinks, and for a length of about four miles the road goes under water in the rains. The total distance to Jaintiapur, where there is an inspection bungalow, is 26 miles, and from here there is a bridle path through Jowai to Shillong, a distance of 64 miles. From Jaintiapur a road runs past Kanairghat, where there is an inspection bungalow, till it meets the old Cachar road 29 miles from Sylhet. The total length of this road is 21 miles, and, at the fifth mile from Jaintiapur, another road runs eastward to the boundary of the district at Natwanpur and connects with a bridle path from Silchar. A driving road also runs from Sylhet, a distance of 23 miles, to Sherpur steamer station, in the south-west corner of the *sadr* subdivision. It was intended that this road should be met by a road to be constructed from Habiganj by the Local Board of that subdivision, but only four miles of the projected road are as yet completed.

Other roads in
North Sylhet.

There is an inspection bungalow at Tajpur, 15 miles from Sylhet, and also at Sherpur. Another inspection bungalow is situated at Dhakadakshin or Thakurbari, the home of Chaitanya's father, which is connected by a short branch road with the Sylhet-Cachar road at Golapganj.

A second main thoroughfare, 79 miles long, runs from Sylhet to Habiganj, through Fenchuganj, Kajaldhara, Srimangal, and Mirpur. There is a dak bungalow at Fenchuganj, where the road crosses the Surma river, and inspection bungalows at Srimangal and Mirpur. The subdivisional headquarters station at Maulavi Bazar is connected with this highway by a road running past Rajnagar to Kajaldhara, and thence past Hingajiya thana to the old Faticoolie guard in the hills; and by two other roads to Shamsdernagar and Srimangal, at both of which places there are stations on the Assam-Bengal Railway. These two roads are connected by a third which runs across the Balisira hills, and at Narainganj, on the Maulavi Bazar-Shamsdernagar road, another road turns south to Adampur. There is an inspection bungalow on this road a little to the south of the point where it crosses the Sylhet-Habiganj thoroughfare. Various minor roads run from the Maulavi Bazar-Kajaldhara road to the tea gardens in the Ita hills. A road also runs from Maulavi Bazar to Manumukh steamer station on the Kusiara river, where there is a dak bungalow. It is $9\frac{1}{2}$ miles long, but as the distance by river is very little longer, the latter route is generally preferred for journeys down stream.

The most important road in the Habiganj subdivision is the one that runs from
Habiganj roads.

Habiganj to the railway station at Saistaganj, the first section of which is part of the great semi-circular road from Habiganj to Sylhet. This road is continued from Saistaganj up the valley of the Khowai past Muchikandi, to Assampara 23½ miles from Habiganj. From Mirpur, which is situated on the Sylhet-Habiganj road, a little to the east of Saistaganj, a road runs past that place, Shahji Bazar, and Jagadishpur to Chakerghat in the extreme south-west corner of the district. From Jagadishpur a road runs west to Madhabpur, and from Surma a road runs east which joins the Muchikandi road a little north of that place, but part of it goes over private land. Another important road runs from Shahji Bazar past Lalchand to Laskarpur garden; and there are roads from Habiganj to the steamer station at Madna on the Dhaleswari river, and northwards to Baniyachung, but the two last are only open for traffic in the winter. From Mirpur a road runs past the Satgaon hills to Putijuri, a distance of 8 miles. There is a dak bungalow at Habiganj, and inspection bungalows at Mirpur, Shahji Bazar, Jagadishpur, Putijuri, Saistaganj railway station, Madna, Chunarughat, and Baniyachung.

The only regular road in the Sunamganj subdivision
Sunamganj. is the one to which reference has been already made which connects it with Sylhet, but in the cold weather there are tracks to Dharmapasha and Mullapara, with inspection bungalows at Sachna on the former and Mullapara on the latter route.

Apart from the old and the new alignment of the Sylhet Cachar road, the principal roads in Karimganj are those to Hingajiya and Oliviachara. The latter runs due south from Karimganj up the valley of the Langai past Nilambazar to Patharkandi. Here it crosses the Pratapgarh hills into the valley of the Sonai, or Chargola valley, as it is generally called, up which it runs to Oliviachara, 41 miles from Karimganj. There are inspection bungalows at Nilambazar on the 10th mile, at Patharkandi 10 miles further on, and at Dullabchara on the 34th mile. There are ferries at the 1st, 3rd, and 34th miles, but the rest of the road is furnished with substantial bridges. At Fakirhat a little to the west of Karimganj, a road branches off from the Sylhet-Cachar road and runs along the west of the Pathariya and Langla hills, past Latu, Shabazpur, Barlekha, Dakhinbhag, Kulaura, and Hingajiya to Duttgram, which is situated at the point where the Tippera boundary and the Manu meet. There are inspection bungalows at Barlekha on the 15th mile, and at Kulaura in the South Sylhet subdivision. This road is connected with the Langai valley road by roads that run across the Pathariya hills from Barlekha to Patharkandi, a distance of $13\frac{1}{2}$ miles and from Shabazpur to Nilambazar, a distance of 8 miles. A little to the south of Shabazpur, a road runs 5 miles west to Jaldhub, and thence 7 miles north to the Bairagi Bazar steamer station on the Kusiara. All of these roads, with the exception of the sections already mentioned, are raised above flood level and are open to wheeled traffic throughout the year.

The following statement shows what an enormous development of postal business there has been since 1861 :—

Number of Post Offices in 1903-04.	Number of letters and post cards omitting thousands delivered in			Number of Savings Bank accounts in		Balance at credit of the depositors.	
	1861-62	1870-71	1903-04	1871-72	1903-04	1871-72	1903-04
115	38	82	2,359	39	4,711	Rs. 16,000	Rs. 5,92,000

A list of post and telegraph offices will be found in the Appendix.

There is a considerable difference between the machinery of trade in Sylhet and in the Commerce & Trade :
 general remarks. Brahmaputra Valley. The Assamese have no commercial aptitude, and almost the whole of the trade of their country has passed into the hands of natives of Rajputana or Ajmer-Merwara. These enterprising merchants buy up the products of the valley and the adjacent hills, and despatch them by steamer to Calcutta, and by the same route they obtain the salt, oil, piece-goods, and other commodities which they retail to the villager or garden cooly. Trade is centralized in the hands of a single community, many of whose members are possessed of considerable influence and wealth, and are substantial merchants and not mere petty shop-keepers. The trade of Sylhet has been to a great extent retained in the hands of the natives of the district, and its profits

are more widely distributed than in Assam.* Traders from Bengal come up the rivers in the rains, and buy direct from the cultivators, either at the bazars, which are generally situated on the river's bank, or in the villages themselves. There are of course merchants at the principal centres, many of whom amass considerable fortunes, but they do not carry on their operations on such an extensive scale as do their confrères in the Assam Valley. Their shops are small and mean in comparison with the large masonry buildings in the bazars of Gauhati and Dibrugarh, and they lean more to the retail than the wholesale side of commerce.

The trade of the district is carried on with Cachar, the Khasi Hills, Hill Tippera, and Bengal. No attempt is made to register the trade with the first two districts, and that with Cachar is probably not large. From the Khasi Hills come potatoes, oranges, limestone, pan, bay leaves and cotton, which are carried down by coolies, who return with rice, dried fish, and oil. But the great bulk of these imports from the Khasi Hills, merely pass through the district of Sylhet and their ultimate destination is Calcutta.

The principal bazars are situated at the foot of the hills at Mulagul, Jaintiapur, Jafang, Lakhat, and Bhola-ganj. At the two latter places market dues are levied by the Khasi Siems of Cherra and Khyrim.

* The population of the Surma Valley was slightly larger than that of the Brahmaputra Valley in 1901, but it contained only 525 natives of Rajputana and Ajmer-Merwara as compared with 8,681 in the northern valley.

Trade from Hill Tippera comes down the Langai, Singla, Juri, Manu, and Khowai rivers, and is registered at Muchikandi in the Habiganj subdivision and at Nowakhali in South Sylhet.

The principal imports are timber, bamboos, and canes, raw cotton, and *til*. The statement in the margin shows the average annual value of each of these articles during the three years ending with 1903-04. The chief exports are dried fish worth some Rs. 20,000, cotton yarn and piece-goods, and tobacco, but the exports are small in comparison with the imports. This is only natural as Sylhet exports raw material and it is manufactured products that Hill Tippera requires. The trade is to some extent hampered by the heavy export duties charged by the Tippera authorities. Cleaned cotton has to pay as much as Rs. 4 per maund, *til* Rs. 1-6-0 per maund, and mustard As. 9 per maund. Duties are also levied on timber and other forest produce.

Sylhet exports to Bengal little but raw materials—the principal exports consisting of un-husked rice, tea, oil seeds, hides, bamboos and mats; and lime, oranges, and potatoes which come in the first place from the Khasi Hills. The chief imports are cotton piece-goods, salt, tobacco, sugar, and oil. The following statement shows the average weight of the principal imports and exports during the five years ending with March 31st, 1903.

(a) Figure for 1903.

(b) Average for 5 years.

Statistics of the weight of goods carried by railway and steamer are obtained from the companies concerned and can be accepted as correct. Boat traffic is registered at Bhairab Bazar, and it is only probable that the cargoes of boats that pass at night, or on days when the current is running strong and there is a fresh breeze blowing, are omitted from the registers. The recorded volume of trade is thus in all probability smaller than the actual quantity.

The great bulk of the trade is still carried by water, and in 1902-03 only 18 per cent. of the imports and 9 per cent. of the exports went by rail. A large proportion of the river borne trade is carried in country boats, which, though slow, are comparatively cheap. A

list of the principal rivers used for traffic is appended to this chapter.

The principal centres of trade in Sylhet are the district and subdivisional headquarters, Ajmiriganj, Balaganj, and Chhatak. **The district bazars.** Most of the business of the district is transacted at bazars which are generally situated on the banks of rivers. The villagers assemble at these places once or twice a week and exchange the products of their farms, and there are generally a few permanent shops which are kept open throughout the year. A list of these bazars will be found in Statement C. in the Appendix. Sylhet town, which is fairly typical of the larger centres, has two distinct bazars. The streets of the Bunder Bazar are not unlike some of the less important thoroughfares of Calcutta. There are rows of small mean shops in which the would be purchaser can obtain such things as piece-goods, clothes of all sorts and kinds, stationery, enamelled cups and saucers, *hukkas*, umbrellas, lamps, candles, buttons and general haberdashery, iron pots and pans, steel trunks, furniture of wood and wickerwork, and different sorts of bangles. There are in addition two or three shops which cater for the wants of the European community and a vendor of imported liquor. In the Kazi Bazar the staple articles of trade are various kinds of grain, vegetables, spices, tobacco, molasses, mats, pottery, and kerosine oil.

The district contains only two urban areas in which municipal law is in force, *i. e.*, Sylhet and Habiganj. Sylhet was first

Municipalities:
Sylhet.

constituted a municipality under Act V. (B. C.) of 1876 in 1878. Act III. (B. C.) of 1884 was introduced in 1888. Habiganj was constituted a union under Act V. (B. C.) of 1876 in 1881.

The municipal committee of Sylhet consists of 15 members, of whom 10 are elected and 12 are non-officials, and they are presided over by a non-official chairman. The principal taxes imposed are (1) A tax on persons at the rate of $\frac{3}{4}$ per cent. of the annual incomes of the assessees ; (2) a tax on Government buildings at the rate of $7\frac{1}{2}$ per cent. of the annual value ; and (3) a latrine tax at the rate of fifteen per cent. on the value of holdings ranging from Re. 1 to Rs. 12 in annual value, five per cent. for holdings with an annual value of between Rs. 13 and Rs. 100, four per cent. if the annual value is between Rs. 101 and Rs. 300, and three per cent. if it exceeds that sum. Sylhet is the largest town in the Province, but its income per head of population during the year 1902-03 was lower than that of any other urban area except Habiganj, Goalpara, and Barpeta. The incidence of taxation on persons was only As. 6-1 per head of population, a rate lower than that prevailing in any town in the Province except Habiganj, Nowgong, and Golaghat. The principal sources of income are the tax on persons and on Government buildings, the conservancy rate, and the tolls on ferries across the Surma, which are to a great extent paid by persons residing outside the municipality. The lowness of the assessment is not, it may be added, due to the want of objects upon which public funds might be suitably expended.

The affairs of Habiganj are managed by a Committee of five nominated members presided over by the Subdivisional Officer.

Habiganj.

The principal sources of income are pounds, ferries, a grant from the Local Board of Rs. 1,000, and a tax on persons. The latter item is practically the only portion of the public income that is drawn from the inhabitants of the union, and the incidence per head only amounts to As. 4-9. The people of Habiganj may thus look upon themselves as very lightly taxed. Details with regard to the principal items of expenditure and revenue in Sylhet and Habiganj in 1890-91 and 1900-01 will be found in Table XVI.

Sylhet town presents a rather mournful spectacle of general degeneration and decay. In the days of Muhammadan rule it must have been a place of some importance, and Mr. John Willes reports that the population at the time of the permanent settlement was 75,382. At first sight it would appear that he must have been referring to a much larger area than the town itself, as his predecessor, Mr. Lindsay, characterised it as "an inconsiderable bazar or market place." On the other hand, in 1809 A. D., the Collector proposed to impose a tax on all houses in the *kasbah* or town of Sylhet, of which he said that there were supposed to be some 31,220, all of which were apparently situated on the land on which no revenue had been assessed. In 1811, this assessment was imposed ; it was found that there were 10,098 houses, but the total amount of the tax assessed was only Rs. 926-0. Considerable

Sylhet Town.

opposition had been offered to the assessment, the householders had declined to supply the assessing officers with the information they required, and the shop-keepers had closed their shops. The assessment was, on the face of it, ridiculous. But the Collector did not seem disposed to press the point, and proposed, that as the tax had proved, as taxes always do, unpopular, and, as the demand was inconsiderable and out of all proportion to the cost of realisation, the matter might be dropped. In 1813, the Collector estimated the population of Sylhet town as 30,000 persons living within a circuit of two *koss*, i. e., four miles. The first regular census was taken in 1872 when the population was reported to be 16,846 souls. Since that date it has steadily declined, the figures being 1881, 14,407 ; 1891, 14,027 ; and 1901, 13,893, though in the latter year the total was swelled by the inclusion of some 500 workmen who were engaged in the reconstruction of the public buildings that had been demolished by the earthquake.

The town is situated on the north bank of the Surma, and, viewed from the river, **General appearance of town.** seems to consist of two bazars, the Kazi and the Bunder, with an open space in the centre, in which are situated the public offices. The Deputy Commissioners' house stands on the west side of a large tank, near the site which was formerly occupied by the bungalow of Mr. Thackeray, the first Resident of Sylhet, and is confronted by a long row of spacious but somewhat mean looking cutcherries. The Bunder Bazar consists of rows of small shops, in which piece-goods, clothes, and general haberdashery can be procured.

In the Kazi Bazar most of the merchants deal in grain and food stuffs, and their transactions are on a somewhat larger scale. It is here that markets are held on Mondays and Fridays to which the villagers bring their produce for disposal. The residential portion of the town lies back from the river, and its most striking characteristic is the dense jungle of bamboo in which the houses are almost invariably embedded. There are numerous roads, many of which are metalled and supplied with solid masonry bridges, but crumbling houses and deserted homesteads are evidence of a glory that has passed away. On every side are to be seen small mosques and the masonry tombs of dead Muhammadan saints, in whose honour lamps are still kindled at nightfall by the faithful. About a mile north of the river is the old polo ground, and the bells of arms which recall the time when a detachment of the Sylhet Light Infantry, whose headquarters were at Cherrapunji, was stationed in the town ; while close by is the famous mosque of Shah Jalal. It is in this quarter that most of the houses of the European residents are situated, on low hills from which a fine view is obtained over the surrounding plains, and it is here that the Idgarh has been built, a large masonry platform surrounded by brick walls, on which service is held on the occasion of the Ids.

The public buildings include the courts and offices of the Deputy Commissioner, the Judge, the Sub-judges and the Munsifs, a large jail, the Murarichand second grade college which has been founded and endowed by Raja Girish Chandra Rai, a Government high school, eight other

schools for boys and two for girls, a church, a dispensary and leper asylum, a town hall, and a public library. There are fourteen masonry wells in the town, but most of the people take their water from the river or from small tanks in the compounds of their houses. No less than twenty-four miles of unmetalled and eight miles of metalled road are maintained by the municipality, and as, owing to the extremely light incidence of municipal taxation, the funds at their disposal are not large, many of them are not in very good repair. The roads in Sylhet are rendered beautiful by the groves of graceful bamboos with which they are shaded on either side; but, apart from this, the town has a somewhat unkempt and desolate appearance, and there are no signs of flourishing trade, prosperity, or wealth. This, however, is but natural. In the days of Mughal rule it enjoyed the prestige which naturally attaches to the residence of a native official of some importance. It was the largest town on the frontier and was thus the centre of some trade. But with the opening up of Cachar and the development of the southern and eastern portion of the district, trade was naturally diverted to the more direct route along the Kusiya. The process was accelerated by the gradual silting up of the bed of the Surma and the enormous expansion of the tea industry both in Cachar and later on in the southern portion of Sylhet, which stimulated the growth of places like Balaganj and Karimganj.

The town of Habiganj stands at the confluence of the Barak and the Khowai in $24^{\circ} 23' \text{ N.}$ and $91^{\circ} 26' \text{ E.}$ Like most of the villages in this inundated tract it is built on the banks of the

rivers, which are raised a little above the level of the surrounding country. The public buildings and the residential quarter are situated on the left bank of the Khowai, but the most populous and wealthiest portion of the bazar is situated on the left bank of the Barak. There is a considerable trade, most of which goes by country boat. The principal imports are grain and pulse, cotton piece goods, kerosine and other oils, and salt. The chief exports are unhusked rice, jute, mustard, linseed, and hides. The majority of the merchants are natives of the district and members of the Shaha caste. The population of the town in 1901 was 5,236.

Sunamganj is a small town with only 3,530 inhabitants on the left bank of the Surma.

Sunamganj.

During the rains the whole of the country in the neighbourhood is submerged, and there is a fine view across this waste of waters to the Khasi Hills. The town practically consists of a single road along the river bank, and is altogether a most unprepossessing place.

Maulavi Bazar, the headquarters of the South Sylhet subdivision, has a population of 2,481

Maulavi Bazar.

persons. It consists of a small bazar on the left bank of the Manu. About a mile to the south, the subdivisional officer's bungalow and court and the subdivisional jail stand upon the northern slopes of the Balisira Hills, a tract of elevated rolling country which rises a few hundred feet above the level of the plain.

Karimganj, the capital of the subdivision of that name, stands on the left bank of the Kusiya river, in $24^{\circ} 52' N.$ and $92^{\circ} 2' E.$ There is a small bazar near the water's edge, but the place is favourably situated for the purposes of trade as, in addition to the facilities which it enjoys for water transport, the railway passes only a mile away to the south. The public offices and the bungalow of the Subdivisional Officer have been built on the summit of low hills ; and command a fine view of the blue ranges of North Cachar. The population of Karimganj in 1901 was 5,692.

There are other places which, though not worthy of the name of town, are still of sufficient importance to merit special mention. Ajmiriganj is situated in $24^{\circ} 33' N.$ and $91^{\circ} 15' E.$ on the banks of the Surma river, and in 1901 had a population of 583 persons. It is an important centre of trade, the chief exports being rice, dried fish, bamboos, and mats, and the imports, grain, oil, salt, tobacco, sugar, and piece-goods. Trade is carried on largely by country boat, though the village is a place of call for steamers.

Balaganj is situated in $24^{\circ} 39' N.$ and $91^{\circ} 50' E.$, on a narrow spit of land between the Kusiya and the Barbhanga rivers. It is little more than a mud bank, and is not even connected by road with any other place, but it is admirably situated for the purposes of water communication and is now the most important centre of trade in the Surma

Valley, with a large business in rice, mustard, linseed, jute, oil, *sitalpati* mats, and salt. The village is a place of call for river steamers, and a European firm has opened a warehouse for the sale of salt and oil.

Baniyachung is situated in $24^{\circ} 31' N.$ and $91^{\circ} 21' E.$

Baniyachung. It is the largest village in the Province, and in 1901 had a population of 28,883. It is said to have been founded in the first half of the 18th century by Abid Reza, the first of the converted Hindu Rajas of Laur, who submitted to pay tribute to the Mughals. The village contains a mosque of great local repute, a dispensary, a high school, two bazars, and about two hundred shops. It is surrounded by a moat and the houses are closely packed together on islets of high land separated from one another by marshy ground and watercourses.

Chhatak is situated in $25^{\circ} 2' N.$ and $91^{\circ} 40' E.$, on the left bank of the Surma river. The river is navigable by steamers up to this point all the year round, and there is a large export trade to Bengal in lime, potatoes, and oranges. A tall and massive masonry obelisk, erected in memory of Mr. Inglis, who founded a large business in lime, stands on the summit of a low hill, from which a magnificent view is obtained over river, swamp, and forest to the blue line of the Khasi Hills, which rise like a wall from the plains.* This obelisk was cracked in three places by the earthquake of 1897, and the pieces were wrenched round in

* An account of the Inglis family will be found in the Gazetteer of the Khasi Hills.

the same plane without being thrown down. The village is built along the left bank of the Surma, as in Sylhet the banks of the rivers are the highest part of the country.

In 1872, the management of the district roads was entrusted to a committee presided over by the Deputy Commissioner. **Local Boards.** The funds at their disposal were partly obtained from tolls and ferries on local roads and other miscellaneous sources, but principally from grants made by the Bengal Government from the amalgamated district road fund. In 1874, when Assam was erected into a separate Administration, the Government of India assigned one-seventeenth of the net land revenue for local purposes. The district improvement fund was then started, and the administration of its resources was, as before, entrusted to the Deputy Commissioner assisted by a committee. The actual amount placed at their disposal was not large, and, in 1875-76, the total income of the district funds of the Province was only Rs. 1,85,000, which was a small sum in comparison with the twelve and a half lakhs of rupees received by the Local Boards in 1903-04. In 1879, a Regulation was passed, providing for the levy of a local rate, and the appointment of a committee in each district to control the expenditure on roads, primary education, and the district post. Three years later the district committees were abolished by executive order, and their place was taken by boards established in each subdivision, which are the local authorities in existence at the present day.

The Deputy Commissioner is chairman of the board of the headquarters subdivision, but each of the other boards in the district is presided over by the Subdivisional Officer. The Local Boards are entrusted with the maintenance of all roads within their jurisdiction, except a few main lines of traffic which have been retained under the direct management of the Public Works Department, with the provision and maintenance of local staging bungalows and dispensaries, and with the supervision of village sanitation, vaccination, and the district post. They are also in charge of primary education, subject to the general control of the Education Department, and are empowered to make grants-in-aid to schools of higher grade, subject to certain rules. For these purposes, they have placed at their disposal the rate which is levied under the Assam Local Rates Regulation of 1879, at the rate of one anna per rupee on the annual value of lands, as well as the surplus income of pounds and ferries, and some minor receipts. This income is supplemented by an annual grant from Provincial Funds. The principal heads of income and expenditure are shown in Table XV.

The annual budgets of the boards are submitted to the Commissioner for sanction. The estimates for all works costing Rs. 500 or over must be submitted to the Public Works Department for approval, and important works, requiring much professional skill, are made over for execution to that department. Less important works are entrusted to the Board surveyors.

The roads of Sylhet are of comparatively recent origin, and the great majority of them have been constructed by the various Local Boards. In South Sylhet the local authority has provided funds for the construction of 173 miles of road and 28 permanent bridges. In Karimganj 121 miles of road have been completed. The Habiganj Board, in addition to making many miles of road, has paid for 30 permanent and 22 semi-permanent bridges. The expression "paid for" is used advisedly, as, when the work presents any special engineering difficulties, it is generally entrusted to the Public Works Department for execution.

CHAPTER VII.

GENERAL ADMINISTRATION.

Land Revenue—Early Settlements—The Permanent Settlement—The Hill Tracts—Temporarily settled estates—Deforestation—The Jaintia Parganas—Tea Land—Land revenue collection—Excise—Income-tax—Stamps—Public Works—Government—Administrative subdivisions—Criminal and Civil Justice—Registration—Police—Chaukidars—Volunteering—Jails—Education—Medical—Leprosy Asylum—Surveys.

For the purposes of land revenue administration the district is divided into two distinct areas. Sylhet proper came into the possession of the Company when they acquired the *diwani* of Bengal in 1765, and a considerable portion of it was included in the permanent settlement; whereas the Jaintia Parganas were not annexed till 1835, and, like the rest of the Province, are temporarily settled.* Sylhet proper, again, is not a homogeneous tract, but scattered over the permanently settled area there are a large number of estates which were occupied and settled at various dates subsequent to the permanent settlement; while in the south of the district there were extensive tracts of jungle to which claims of a somewhat vague and dubious character were put forward by the neighbouring land-holders.

The whole history of the land revenue system of Sylhet is thus of a very complicated character, and cannot be adequately dealt with in the pages of a District Gazetteer. A more detailed account of the subject will

* Even in the Jaintia Parganas there are, however, 33 permanently settled estates.

be found in the Introduction to the Assam Land Revenue Manual, by Sir W. E. Ward, K. C. S. I., pages CXIII—CLVIII.

The earliest settlement of Sylhet proper was that made by Tudar Mall in 1582, and he is said to have assessed the revenue at Rs. 1,67,040.* This would, however, have been a rather heavy assessment in comparison with the demand of later years, and it is not probable that the whole of this amount was ever credited in the Imperial Treasury. In 1728, the land revenue actually paid to Government is said to have amounted to Rs. 70,076, and in 1787 Mr. Lindsay reported that it had never exceeded Rs. 1,25,000. In 1776, Mr. Holland assessed the district at about Rs. 2,00,000, and six years later it was farmed out at Rs. 2,50,000, but this amount could never be collected. A few years later Mr. Lindsay concluded his settlement for Rs. 1,87,500.†

Up to this time, the settlements seem to have been of a very tentative and temporary character, but in 1788 a step was taken which was destined to leave a permanent mark upon the district. In the cold weather of 1788-89 the Collector, Mr. Willes, commenced his measurements and settlements, and in August 1789 he reported that the work had been completed. He did not, as in most of the other districts of

* Principal Heads of the History and Statistics of the Dacca Division page 292.

† The revenue was actually assessed and paid in cowries, and in converting it into rupees four *kahons* of cowries have been taken to be equal to one rupee, but the rate of exchange varied considerably at different times.

Bengal, enter into engagements with the *chaudris* or land revenue collectors, but settlement was as a rule made direct with the actual cultivators of the soil. The total area covered by his operations was 2,100 square miles, and the character of a detailed settlement, which was carried out over such an extensive area in a single working season, can better be imagined than described. His work must, however, have been so frequently anathematised by his successors, that it is only fair to add that Mr. Willes was not a willing agent in the matter. He wrote somewhat plaintively on the subject to Government in 1790, and it is only fair that he should be heard in his own defence—"I shall first observe that the *hastabud* of the district did not originate with me.....had I consulted my own ease in preference to my duty I might have stated many plausible objections.....as soon as the rains would admit I entered on the disagreeable task, and in the execution of it I have received every possible opposition from the Kanungoes and other Mussalman inhabitants.....yet, gentlemen, I shall ever conceive it peculiarly unlucky that I should have been so unremittingly employed for a year on an object of so little import to Government, that any credit I might otherwise have obtained is lost in its insignificancy." *

Mr. Willes did not, moreover, anticipate that this extremely perfunctory settlement would be accepted as a

* Letter No. 119, dated 24-2-1790. The concluding paragraph recalls a similar complaint made by Col. Hopkinson, Commissioner of Assam, who in 1872, after carrying out the re-settlement of the valley, remarked in a letter to the Government of Bengal "I sometimes wonder whether it has often happened to an officer to have taken so large a part in proposing and realizing a measure fraught with such solid advantages to the state as that scheme secured, and to have obtained such scant thanks for it."

permanent engagement between Government and its tenants. Most settlements were at that time for comparatively short periods, and the Collector probably regarded the one carried out under his direction as a temporary makeshift.

He was fully conscious of the imperfections of his work, and for fear lest it might give rise to permanent and serious inconvenience, he caused most of the original documents to be destroyed. The only records in the Collector's office which bear Mr. Willes' signature are the *daul* and *talukwari* registers. The other papers bearing on the settlement were produced by the pargana patwaris in 1802, and are either duplicates prepared at the time of settlement, or unauthenticated copies of those duplicates, or possibly, for all we know, the creations of the patwaris' fancy. The *chittas* purport to show the boundary of each estate, but these boundaries are often of a vague and useless character, and some of the estates are simply said to be bounded by "hills" or "jungle."*

It soon became clear that there were extensive tracts of land which had never come within the purview of Mr. Willes' perfunctory operations, and in 1802 the Collector, under the orders of the Board of Revenue, directed the patwaris to furnish statements of these unsettled lands.

Permanently settled estates not included in Mr. Willes' settlement.

* A list of the records of the decennial settlement in the Sylhet Collectorate will be found in Deputy Commissioner's letter No. 4097, dated 27th August, 1879.

On receipt of these lists, notices (*ilams*) were issued calling on claimants and objectors to come forward. The Board then ordered the Collector to grant leases for the lands reported in the lists of the patwaris, and for other land found outside the boundaries of the permanently settled tract. These leases were issued between 1801 and 1807, and, though the term of settlement was not fixed, it was decided in 1869 to treat these lands as permanently settled. The lists of the patwaris were, however, very incomplete, and subsequent surveys have shown that the district contained nearly a million acres of land, in addition to the estates which had been surveyed and settled.* In 1817, the question of the settlement of these excess lands was again raised, and in 1834 it was decided that excess land, which had been included in the patwaris' *ilam* returns, and to which the rights of Government were undisputed, might be assessed. With regard to the remainder, it was decided in 1840 that they were not worth the trouble and expense of settlement.

Between 1859 and 1865, Sylhet came under the operations of the revenue survey, which is generally known as the *takbast*, as proprietors were then required to demarcate their estates with *taks* or marks.

This survey is of such importance that it is only right that the objects aimed at, and the methods by which it was hoped that they would be attained should be described in some detail. The following account is taken

* The calculation will be found on page CXXX of the introduction to the *Assam Land Revenue Manual*, Calcutta, 1896.

from a note recorded by the Director of Land Records and Agriculture, Assam, in 1892. The chief design of the survey of a district was to ascertain the position boundaries, and area of every village and estate in that district. In order to ascertain this, two parties went into the field, *viz.* (1) an unprofessional party under a special officer called the Superintendent of Survey aided by Deputy Collectors and an establishment of *peshkars* and *amins*, and (2) the professional party. The work assigned to the unprofessional party consisted in demarcating the boundaries of villages and estates, and settling boundary disputes, and the demarcation was required to be made a whole season in advance of the survey of the district to be undertaken by the professional party.

Before proceeding to demarcate the villages and estates of the district, the Superintendent of Survey received from the Collector lists of all such villages and estates in the district. These lists having been distributed among the several *amins*, to whom the work of demarcation was immediately entrusted, the *amins* proceeded to call upon the zamindars, raiyats, and other occupants of land to point out their boundaries, and, on the boundaries being pointed out, in all cases where the estates or villages given in the Collector's list could be traced, they were demarcated on the ground by *taks* or marks.

In carrying out the work of demarcation, the unprofessional party first laid down the village boundaries, and after that the position and boundaries of all estates having any lands in that village. They also prepared what are known as "*takbast* maps," most of which were on the

scale of 16 inches to the mile, which showed the boundaries not only of the village but also of every estate or portion of an estate included in it. The estates or portions of estates entitled to separate demarcation and entry in these maps are specified in sub-section 12 of section II, Chapter XXIII of the Board's Rules of 1866.

When a sufficient number of contiguous villages, with the estates or portions of estates contained in each village, had been demarcated, a *mujmili* or sketch map was prepared containing 80 to 100 square miles of country, and showing the names and relative positions of the villages which had been demarcated. The professional revenue surveyor then went to work, being guided entirely by the *taks* laid down by the unprofessional *amins*. He, however, confined himself solely to the external boundaries of villages. He had nothing to do with the internal details of villages, *i.e.*, the boundaries of estates or portions of estates beyond calculating the areas of those estates which the Superintendent of Survey sent him for triangulation. The professional maps, therefore, are village maps, showing geographical and topographical features.

The survey was never confirmed as required by section 4 of Act IX of 1847, and its accuracy has more than once been called in question. A test survey was accordingly carried out in 1881-1882, and the conclusion come to was that the original revenue survey, judged as a survey, was probably as accurate as such surveys usually are, but that the boundaries pointed out were in many cases

Takbast survey brings out great increase in permanently settled area.

wrong. The unprofessional party seem to have accepted without question or demur the boundaries pointed out by the proprietors, and it is hardly matter for surprise that there was found to be a large increase in the permanently settled area. These estates in Mr. Willes' day covered an area of 1,685,000 acres; but, on the completion of the *takbast*, the area was found to be 2,231,000 acres. In individual cases the increase was sometimes quite enormous, two of the most flagrant instances being Nos. $\frac{64}{47070}$ Faiz Muhammed and $\frac{73}{47079}$ Makanullah, in mauza Srichandanjum pargana Bhanugach. At the permanent settlement neither of these estates covered as much as three roods of land; the *takbast* allowed each of them 4,725 acres. At the same time, in the absence of any better record, the *takbast* maps are often accepted by the Civil Courts as evidence of boundaries, possession, and title.

In 1902-03, the permanently settled area in Sylhet was said to amount to 2,411,081 acres, classified under the following heads:—

Different kinds of permanently settled estates.

- (a) *Dassana*, i.e., estates included in the decennial settlement, which became permanent in 1793.
- (b) *Bazyafiti daimi*, i.e., invalid *lakhiraj* lands, resumed by the Special Commissioner appointed under Regulation III of 1828, and then permanently settled.
- (c) *Ilam daimi*, i.e., *ilam* lands permanently settled.
- (d) *Khas daimi*, i.e., permanently settled estates purchased by Government at sales for

arrears of revenue, and sold again as permanently settled.

- (e) *Halabadi, i.e.*, land which was not included in the decennial settlement, but which was settled without specifying the term of settlement, and was afterwards declared by Government in 1869 to be permanently settled.
- (f) *Khas halabadi, i.e.*, estates belonging to class (e), which, on being bought in by Government at sales for arrears of revenue, were subsequently permanently settled.
- (g) *Permanently settled waste land grants*.—The proprietors of three *halabadi* estates, paying a revenue of Rs. 9-5-3, claimed a large tract in the Raghunandan hills. Their claims were compromised by the grant in perpetuity of two estates, covering an area of 1,659 acres and paying a revenue of Rs. 9-6-0.
- (h) *Izad daimi, i.e.*, excess lands discovered after Mr. Willes' settlement, and then settled permanently.
- (i) *Haor mahal*.—Marshy land excluded from Mr. Willes' settlement and subsequently permanently settled.

Mr. Willes' system of settling direct with the cultivators had the natural result of creating an enormous number of separate holdings, from each of which a distinct and separate payment was required. According to Sir William Hunter, there were, in 1793, 26,393 estates on the rent

Subdivision of
estates.

roll held by 29,317 separate proprietors.* This in itself was bad enough, but by 1865 the number of permanently settled mahals had doubled, yet only one-fifth of them paid a revenue of five rupees or more. 22,000, or nearly one-half, paid a revenue of one rupee or less, the average demand on account of each estate being about $6\frac{1}{2}$ annas, while another 14,000 estates paid between two and three rupees.

It is hardly necessary to point out that the trouble of collection from such an enormous body of land-holders is out of all proportion to the amount of revenue received. In 1865, the Board of Revenue invited attention to the fact that no less than 437 peons had till recently been employed at *sadr*, and 71 persons, patwaris and others, in the *mofussil*, whose principal duty had been the collection of the revenues.† Such an establishment was not only a source of considerable expenditure to Government, but was a cause of harassment to the people, and it was proposed that proprietors of estates paying not more than one rupee should be allowed to permanently redeem their land revenue at twenty years' purchase. This proposal was sanctioned by the Government of Bengal,‡ but, strange to say, comparatively little advantage was taken of the concession.

In a country like India where the rate of interest is so high, it would not of course pay any one from the

Little advantage taken of concession authorising permanent redemption of the revenue assessed on small estates.

‡ Letter No. 2720, dated 8th July 1867.

strictly pecuniary point of view to redeem a fixed payment at twenty years' purchase, but the sums in question were so small that it was obviously to the interest of the proprietors to free themselves from the necessity of these petty annual payments, even at something above the strict market price. Possibly the orders were not generally known, or obstacles may have been thrown in the way of the people by the Collectorate staff, but, for some reason or another, only 2,414 estates had been redeemed at the time when the permission was withdrawn in 1880. For a time, also, a rule was in force under which the purchaser of a permanently settled estate sold at auction was compelled to redeem the revenue at twenty-five years' purchase, if it was not more than one rupee, but the number of estates redeemed under these orders was comparatively small. This concession was not, moreover, restricted to the permanently settled estates, but under Rule XI of the Ilam Rules of 1876, the revenue on temporarily settled estates could be redeemed at twenty-five years' purchase, provided that it was not more than one rupee per annum.

The ranges which project from the Tippera Hills into the Sylhet plain have been a fruitful source of litigation between Government and the zamindars. The names of these ranges and their estimated area is shewn in the statement in the margin, the order given being that from west to east. At the time of the permanent settlement these hills were for the most part covered with forest, bamboos, and scrub, in which the

Tipperas would clear a patch of land, cultivate it for a few years, and then move on leaving their fields to relapse once more into the jungle from which they had originally been evolved. Certain rights of commonage are also said to have been enjoyed by the owners of the estates lying near the foot of the hills. These rights, which are known as *jhum*, a term which presumably implied the right to practise shifting cultivation in the hills, or possibly to tax plains men so practising it; *tippera*, or the right to levy a tax on Tippera villages; and *gurkati*, or the right to take or tax forest produce, are sometimes mentioned in the early records found in the collectorate as appertaining to certain permanently settled estates, and as having been assets which were taken into account when the revenue was originally fixed. There is also a fourth easement known as *panisikka*, but the very meaning of this term is lost, and, apart from the vexed question of the actual locality in which this right was to be exercised, no one at the present day has the very least idea what the privileges were which it conferred.

When it was found that the hill ranges possessed a special value of their own, in that they were excellently adapted for the cultivation of the tea plant, claims were, from time to time, put forward, to hold the land over which these easements had been assigned, as an integral part of a permanently settled estate. One of the most important of these claims is one which is known as the Balisira case, and which arose out of the action of the Maharaja of Hill Tippera, who, in 1882, entered into an agreement to lease 30,000 acres of land in the Balisira hills to

Messrs. Finlay, Muir & Co. The Maharaja was the proprietor of certain permanently settled estates in the Balisira pargana, to which these curious easement rights attached ; but there were 75 other estates in the same pargana which were in much the same condition, and Government denied that either the Maharaja or any other person was entitled to proprietary rights in the Balisira hills. In 1886, Government brought a civil suit against the Maharaja to establish their title to the 30,000 acres which formed the subject-matter of the suit ; but the case was never tried, and, in 1897, the matter was finally compromised, and the Maharaja withdrew his claims to ownership.

Difficulty was also experienced in giving leases to tea planters for land over which other persons exercised vague rights of commonage. A Regulation, known as the Jhum Regulation, was accordingly passed in 1891, extinguishing these claims, but providing for the payment of compensation to any persons who could show that they had legally exercised these rights within the twelve years preceding the passing of the Regulation. This measure in no way affected the interests of persons who could show that any portion of the hills had been actually included within the limits of their permanently settled estates, but the High Court have distinctly laid down that the possession of these easements is not in itself evidence that land over which they were to be exercised was permanently settled with the easement holders.*

* *Maulavi Muhammed Ali Amjad Khan v Secretary of State for India.* Judgment delivered on March 29th, 1904.

The temporarily settled estates are divided into the following classes :—

Temporarily settled estates.

- (1) *Ilam*.—This is by far the largest class. A history of the *ilam* settlements is given in the following paragraphs.
- (2) *Nankar patwarigiri, i.e.*, land formerly held free of revenue by the pargana patwaris as *nankar, i.e.*, in lieu of salary. The patwaris were abolished in 1838 and the lands brought under assessment.
- (3) *Charbharat, i.e., alluvial accretions*.—These, in Sylhet, are liable to assessment, but settlement must be offered to the owner of the property to which the lands are an accretion.
- (4) *Bilbharat, i.e.*, silted up beds of *bils* which were excluded from the permanent settlement because they were then useless.
- (5) *Izad, i.e.*, surplus lands discovered after the permanent settlement (but not formally proclaimed as the *ilam* lands were), and thus not included in it.
- (6) Revenue free land resumed because found to be held on invalid titles.
- (7) *Khas, i.e.*, permanently settled estates bought in by Government at sales for arrears of revenue and settled temporarily direct with the cultivators.

Theoretically the *ilam* estates are the lands which were included in the patwaris' returns in 1802, but were not settled under *halabadi pattas* prior to 1807. They are scattered all over the district, and in some parganas there are only two or three, and in many less than one hundred *bighas* of cultivated *ilam* land. Some of the estates consist of a small tank, or a few yards of cow path embedded in the middle of a permanently settled tract, and there are no less than 365 separate plots of *ilam* land embedded in permanently settled estates which have an area of less than five acres. The *ilam* lands were first measured up between 1829 and 1834, the total area reported being 229,950 acres. The first settlement was made in 1836 and was for ten years. All cultivated land was settled with the actual occupant, and on the expiry of the lease it was renewed at the same rates of revenue.

In 1871, steps were taken to effect a settlement in a more regular and detailed manner, and definite rules were laid down in 1876 for the guidance of the officers concerned. Cultivated and culturable uncultivated land were to be assessed at moderate rates, with reference to the rents paid by cultivators for similar land in the neighbourhood. From this assessment 15 per cent. was to be deducted, for expenses and risks of collection, and the remainder was taken to represent the Government revenue. Culturable uncultivated land in excess of one-fifth of the cultivated area was ordinarily to be excluded from settlement; but this provision was not enforced in the case of tea planters who had purchased

ilam leases, as it was recognised that a large proportion of a tea estate must of necessity remain uncropped. They were, however, required to pay revenue on all land under cultivation at the time of resettlement, and for waste equal to one-fifth of the cultivated area, at the same rates as those paid by cultivators for similar lands in the immediate neighbourhood. On the remaining waste the rates laid down in the 30 years lease rules of 1876 were imposed. Leases granted on these terms are described as leases issued under the modified *ilam* rules 1878, but all of them have now expired.

The classification adopted at the settlement begun in 1871 was needlessly elaborate. Cultivated land was divided into fourteen classes and uncultivated land into ten. There were for instance separate classes for homestead, for land adjoining the homestead on which bamboos were grown, for land on which betel or pan was grown, and for orchards or gardens. The maximum rates were actually as high as Rs. 8-4 an acre for sugarcane, and, whereas at the former settlement the average rate per acre of cultivated land was 11 annas 2 pie, it was now raised to nearly Rs. 1-12. The total area settled under the *ilam* and modified *ilam* rules, the *jangalburi* * and other similar rules, and the waste land rules of 1876, was 144,185 acres, of which 21,802 acres were cultivated. But even on the completion of this settlement there was still a considerable area of

* The *jangalburi* rules were issued by the Government of Bengal in 1864. Land could be granted under these rules for the cultivation of ordinary staples as well as of special crops at low but progressive rates of revenue.

waste land in the district which no one was willing to take up.

Some reference must now be made to the land which was included in the jurisdiction of the Pratapgarh tahsil, to which, prior to the *ilam* settlement of 1896, special treatment was accorded. This tract of country lies in the valleys of the Langai and Singla in the south of the Karimganj subdivision, and consists entirely of temporarily settled land, while only a small portion of it, towards the north, was included in the *takbast* survey.* The cultivated land was settled at the same time as the other *ilam* estates in 1859, and was included in the operations carried on by Maulvi Hamid Bakht between 1875 and 1878. Prior to this settlement the rates assessed had been extremely light. The land was situated in a remote and jungly portion of the district, extensions of cultivation were probably in most cases overlooked, and, according to the Deputy Commissioner, most of the cultivators were men who had a strong objection to paying rent, and who had deliberately migrated to this somewhat unattractive valley in the hope that they might thus evade the demands either of Government or landlord.

In spite of this the settlement officer did not hesitate to apply rates, which under the circumstances must be considered very high. On homestead land he imposed a revenue ranging from Rs. 3 to Rs. 3-12 per acre, and the charge for double cropped or garden land was very

* A considerable proportion of the Pratapgarh pargana is permanently settled. The jurisdiction of the tahsildar only extended to the temporarily settled estates.

little lower. The total revenue was suddenly raised from Rs. 3,600 to Rs. 11,800, and as a natural consequence the settlement broke down. In 1878, sanction was accorded to the establishment of a tahsil in this locality, and it was determined to collect the revenue direct from the cultivators, and, if this measure succeeded, to make a direct raiyatwari settlement. The rates were reduced and a fresh settlement was made which was extended till 1893. The temporarily settled portion of the pargana was then cadastrally surveyed, and a settlement made for five years to enable the tract to be included in the area covered by the operations of the *ilam* settlement officer. The Pratapgarh tahsil was abolished in 1894 and this tract is now treated like other *ilam* land.

Further interest attaches to this pargana from the fact that certain claims, known as *baban* and *rasad baban*, are put forward by the owners of some of the permanently settled estates to easements in the Dohaliya hills. This question is of too contentious and complicated a character to be discussed in the pages of a Gazetteer, and is of little interest to the general reader. Those concerned will find further information on this subject in a note by Mr. Cossins, C.S., dated June 25th, 1890.

The area included in the *ilam* settlement of 1896 fell into two broad classes, high land where the staple crop is *sail* or transplanted paddy, and low land on which *aman* is grown and which is liable to flood. These two main classes were again subdivided into better and worse, and the country was thus formed into four assessment classes or circles. Land was divided into homestead, rice land,

The *ilam* settle-
ment of 1896.

land growing other crops than rice, and waste; and in each circle there were two grades for each kind of land, except for rice for which there were three. There were thus 12 classes of rice land, and 8 classes of homestead, other crops, and waste. The rates assessed per acre varied from Rs. 2-10 to As. 15 for homestead, Rs. 2-7 to As. 9 for rice, Re. 1-11 to As. 9 for other crops, and from As. 6 to As. 1-6 for waste. The net result of the operations was that the revenue was raised from Rs. 1,17,785 to Rs. 1,66,112, an increase of Rs. 48,327. Only Rs. 17,258 of this increase was due to enhancement, and the remainder represented the revenue assessed on land which had been newly taken up.

The following statement which has been taken from the report submitted by the *ilam* settlement officer in 1903 shows the temporarily settled area of the district outside the Jaintia Parganas :—

Total				365,294

The expressions modified and ordinary *ilam* have already been explained, and the former is now of purely academic interest as all leases issued under this tenure have expired. *Khas* land falls under two broad heads.

Part of it is what is generally known as Government waste, i.e., land which is too high or too low to be well adapted for cultivation, and which has never at any time been settled with any person. Part of it is composed of permanently settled estates which have been sold for arrears of revenue and bought in by Government. When an estate defaults in this way it is brought on the revenue records of the tahsil in which it is situated and a map is made of it. It is then visited every year by an *amin* or one of the tahsil staff, and, if any one is found in occupation, an annual lease is issued to him, and the land assessed to revenue. The rates imposed are the rates sanctioned for similar *ilam* land in the neighbourhood, or if the land is not fit for cultivation, the rates assessed on waste. The tahsil staff to whom these operations were entrusted were originally allowed considerable latitude with regard to the rates they may have thought proper to assess ; but from the statement in the

margin, which shows the area settled on annual lease in 1903-04 in each tahsil outside the Jaintia Parganas, it appears that the total area affected was inconsiderable. It is further fairly clear that, in a densely populated district like Sylhet, permanently settled estates which have failed to obtain a bid at auction, cannot have many attractions for the cultivator.

Most of the new land which is now being taken up for the first time outside the Jaintia Parganas is situated either in the hills, where there are still a few small patches of land

**Manner in which
land is at present
settled.**

suitable for rice cultivation which are called *chegs*; or in the *haors*, or great depressions which are gradually silting up, and in which cold weather crops are grown. When an application is received the land is first surveyed, unless it has been already mapped in the course of the *ilam* settlement, and a report is submitted showing in which of the four circles laid down at the last settlement it falls. It has already been pointed out that these circles do not consist of actual tracts of country bounded by a ring fence, but there is always other *ilam* land in close vicinity to the plot applied for, which guides the settlement officer in determining the circle to which the land should be assigned. The lease when sanctioned is for ten years, and the rate assessed on culturable land is Re. 1-2 an acre in Circle I and Annas 15 in Circle II, and, in both circles, Annas 6 an acre on waste. In the *haors*, i.e., Circles III and IV, the rates assessed are either Annas 6 or Annas 3 per acre. Land which is found in the possession of persons who have not formally applied for it is settled on annual lease. The area of *khas* land in each tahsil is unfortunately not known.

In the Jaintia Parganas land newly taken up is assessed at the lowest rates imposed on cultivated land in that particular village. In this portion of the district there is a genuine system of fluctuating cultivation, similar to that which prevails to such a great extent in Lower and Central Assam. Low land covered with reeds is taken up and planted out with summer rice or mustard, and after the second or third year is resigned. Annual leases are generally first issued, and, if the cultivator

**Settlement of new
land in Jaintia.**

decides to retain the land, a periodic lease, which terminates in the same year as the current settlement, is given to him. 1,120 acres were held on annual lease in the Kanairghat tahsil in 1903-04, and 5,219 acres in the Goyainghat tahsil.

Reference has been already made to the pressure of the people on the soil, and, to meet this very genuine demand for land, the upper valleys of the Langai and Singla, in the south of the Karimganj subdivision, which originally formed part of a reserved forest, were thrown open in 1898 and 1899. Much of the land was found to be unsuited for cultivation and the total area allotted by June 1902 was only 7,436 acres. The rates assessed were 15 annas an acre on flat and 3 annas an acre for hill land, but no revenue was charged for the first year of occupation.

The Jaintia Parganas are seventeen in number and cover an area of 484 square miles, or 310,000 acres; of which 214,500 acres are settled under one form of tenure or another, and 95,500 acres are waste. They are situated in the north-east corner of the district, and, with the exception of pargana Satbank, lie between the Surma river and the Khasi and Jaintia Hills. They originally formed part of the territories of the Jaintia Raja, but were formally annexed in 1835, as the Raja declined to surrender the persons responsible for the murder of three British subjects who were sacrificed at the shrine of Kali in 1832. The revenue of the Raja was derived from

several heads. Land revenue was paid in kind or labour, fees were levied on appointments, and tolls on ghats, bazars, and fisheries, an item which was said to bring in about Rs. 8,800 per annum. Other sources of revenue were monopolies, presents, and fines. The total income of the Raja was estimated at from Rs. 25,000 to Rs. 30,000 per annum, and to this must be added the amount required to satisfy the demands of the subordinate officers through whose hands it passed.

In 1836, a summary settlement was concluded for one year by Captain Fisher.
Early Settlements. The revenue assessed amounted to Rs. 35,988, which was believed to be a fair equivalent of the amount taken by the Jaintia Raja. In 1838, the Parganas were resettled for a term of five years, and this settlement was subsequently extended up till 1856. During this period the rates were not raised but land taken up for cultivation was assessed, so that the revenue demand, which was Rs. 38,900 at the commencement of the term, was Rs. 42,800 in 1856. The rates assessed were very low and varied from one rupee an acre for the best kind of double cropped land, to 2 annas 6 pie an acre for waste.

In 1856, a settlement was made for twenty years, the revenue assessed being Rs. 54,443.
The Settlement of 1876. The rate for the best kind of rice land was not raised, but a small enhancement was imposed on most of the other kinds of land. The next settlement showed a very great increase. The rate for homestead was raised from 14 annas 9 pie to Rs. 1-14

an acre, and cultivation was assessed at Re. 1-5 per acre instead of at rates varying from 6 annas 3 pie to one rupee. The revenue, which by 1876 had risen to Rs. 61,900 owing to extensions of cultivation, was suddenly rushed up to Rs. 1,67,542, and as a natural result the settlement broke down. After much discussion it was decided to modify the rates in the less favourably situated villages, and the gross demand was reduced to Rs. 1,23,700, but, even then, it was almost exactly double the amount which had been previously exacted.

This settlement expired in March 31st, 1896, and two years later another settlement was concluded for a term of 15 years. ^{The current settlement.} The land was divided into four classes, homestead, rice fields, cultivation other than rice, and waste, and the villages were distributed into five different grades. The acreage rates assessed varied in the case of homestead from Rs. 2-10 to 12 annas, for rice land from Re. 1-14 to 12 annas, for land growing other crops from Re. 1-8 to 12 annas, and for waste from 6 annas to 3 annas. Land taken up for tea was assessed at Re. 1-14 for each acre under cultivation, and 6 annas an acre for waste. For the first five years of the settlement the increase in any village, whether due to enhancement of rates or extension of cultivation, was limited to 33 per cent. of the former revenue, and in the next five years to 66 per cent. The full assessment, when the enhancement exceeds 66 per cent., will only take effect in 1909. The total sanctioned assessment was Rs. 1,86,532, but the amount at first imposed was only Rs. 1,69,345.

Sylhet was one of the last districts in Assam to be exploited in the interests of the tea industry, and contains few estates held under the earlier rules which were framed to govern the grant of land for tea. One estate, covering an area of 1,837 acres, is held under the rules of 1854. One-fourth of the grant is exempted from assessment in perpetuity. The remaining three fourths had a revenue free period of fifteen years and were then assessed at 3 annas an acre for ten years, and at 6 annas an acre for seventy-four years more, the total period of the lease being thus ninety-nine years. Under the fee-simple rules issued in 1861, permission was accorded to the owners of lease-hold grants to convert their tenure into fee-simple by payment of twenty times the revenue at that time due. Only one grant, covering an area of 1,891 acres has, however, been redeemed. The great bulk of the tea land is held under the rules of 1876, which, after the passing of the Assam Land Revenue Regulation in 1886, were incorporated in a revised form as Section I of the Settlement Rules. The land was sold at an upset price of Re. 1 per acre, and the lease runs for thirty years. For the first two years no revenue is assessed, it is then levied at the rate of 3 annas an acre for four years, and at 6 annas for four years more. For ten years it is 8 annas, and for the last ten years of the lease Re. 1 per acre. The issue of leases under these rules has been discontinued in Sylhet, and a considerable area of tea land is held on ordinary lease. The total area settled under different forms of tenure in the district will be found in Table XIII.

Land taken up
for tea.

Land revenue is paid in at the headquarters of each of the subdivisions, and at the Goyain-
Land revenue ghat and Kanairghat tahsils in Jaintia.
collection.

In the Jaintia Parganas the revenue from estates paying Rs. 50 or less is due in one instalment in May; other estates pay five-sixteenths of the demand in September and eleven-sixteenths in May. In case of default a notice of demand is issued, and if the amount due is not then paid up, the estate can be at once sold, without having recourse to the procedure in force in the other raiyotwari tracts of the Province, under which the land cannot be sold unless an attempt has first been made to realize the arrears by the attachment and sale of the movable property of the defaulter. The dates for payment in the rest of the district vary from April 30th to May 31st, but from estates paying more than Rs. 50, five-sixteenths of the instalment is due on September 30th. If a permanently settled estate falls into arrears, a notice is issued fixing the date of sale, which must not be less than thirty days from the date of the publication of the notice, and if the arrears are not paid up before the day fixed for the sale, it is forthwith knocked down to the highest bidder. In the case of temporarily settled estates outside the Jaintia Parganas the usual formalities of the issue of a notice of demand and the attachment of movable property must be complied with before the estate can be put up to sale.*

* It has recently (1905) been proposed to allow officers discretion to dispense with the notice of demand and to authorise the imposition of a fine not exceeding one rupee in cases of default.

In spite of the lightness of the land revenue demand, which in 1902-03 only amounted to 6 annas 3 pie per head of population, as compared with Rs. 2-7-1 per head in Sibsagar, considerable difficulty is experienced in recovering the lawful dues of the state. Notices of demand are freely issued, and in 1902-03 orders of attachment issued on no less than 13,244 estates, though the total for the whole Province was only 15,271. The amount of arrears for which property was sold in the Province was Rs. 47,618; and of this Rs. 36,835, or more than three-fourths of the whole, was contributed by Sylhet, though the district pays less than one-seventh of the land revenue of Assam. This difficulty in collecting the revenue is largely due to the system of joint ownership which is so prevalent in the district. It has been already shown that in the permanently settled area the revenue assessed on the great majority of estates is ridiculously small, and even these petty sums are due from several individuals and interests. It is frequently the case that, either from accident or design, one of the co-sharers fails to pay his quota, and the estate is accordingly attached and put up to auction. The very lightness of the land revenue assessment on the individual is no doubt in some degree responsible for the difficulty of realization, as people are often careless about the payment of small sums; and, as far as the issue of notices of demand is concerned, the comparison between Sylhet and Assam Proper is hardly fair. In Sylhet these notices are issued automatically as soon as an estate falls into arrears, whereas in Assam they are generally

only served upon persons who are notoriously unpunctual. Many persons also whose homes are situated at some distance from headquarters save themselves the trouble of coming in to pay their revenue by waiting till the arrival of a peon with an attachment order.

Some account has been already given of the early beginnings of excise administration in Sylhet, and of the insignificant amount of revenue obtained. In this respect the character of the district has changed but little during the last century, and, though it contains more than a third of the total population of the Province, it only contributed one-twelfth of the excise revenue in 1904.* About one-half of the revenue was obtained from ganja and two-fifths from country spirit. The greater part of the remainder was derived from opium.

Country spirit is manufactured by native methods and generally in what is known as the closed still. The wash is placed in a large vessel beneath which a fire is kindled. The vapour rises into the still-head and then passes by two pipes into two receivers, which are cooled by water that is allowed to run over them, and thus cause the vapour to be precipitated in the form of spirit. These tubes are so fixed to the receivers that the air cannot have access to the spirit, and, though distillation does not proceed so rapidly, the liquor produced is stronger than that obtained from the open still.

* Province Rs. 30,24,000. Sylhet Rs. 2,61,000.

The material employed is either the flower of the mohwa tree (*bassia latifolia*), which
Material employed. contains a very large proportion of sugar, or molasses and rice. Mohwa is generally used by up-country distillers, and, as the foreigners, who form a large part of the liquor-drinking population, prefer the mohwa spirit, its use is spreading amongst the Sunris who formerly preferred molasses. The following are the proportions in which these ingredients are generally mixed, mohwa 30 seers and water 60 seers; or mohwa 25 seers, molasses 5 seers, and water 60 seers; or boiled rice 20 seers, molasses 10 seers, and water 80 seers. *Susta*, the refuse wash which remains in the retort after the distillation, is sometime used in place of water. *Muli*, a substance composed of leaves, roots and spices, whose actual ingredients are not divulged by the villagers who manufacture it, is frequently added to the wash, which is put to ferment in large earthenware vessels, which, to economise space, are often sunk up to their necks in the floor of the shop. The larger vessels are cleansed before they are filled with wash by heating them with hot ashes or ropes of straw which are allowed to smoulder for some hours inside; smaller vessels are usually washed with water. Fermentation takes three or four days in summer and a week in the cold weather, and the wash is then considered to be ready for the still. The process of distillation takes about three hours. A retort of 40 gallons yields two gallons of spirit in an hour and three-quarters, three gallons in two hours and a quarter, and four gallons in three hours. The best and strongest spirit comes off first, and, in the case of a brew of 30 seers of

mohwa, the first $3\frac{1}{2}$ gallons will be classed as *phul* if they are at once drawn off from the receiver. If they are allowed to remain while two more gallons are distilled, the whole $5\frac{1}{2}$ gallons will be classed as *bangla*. The exact proportions vary, however, at the different shops, some distillers taking $4\frac{1}{4}$ gallons of *phul* or $5\frac{1}{4}$ gallons of *bangla* from 30 seers of mohwa. Occasionally only two gallons of spirit are distilled from 30 seers of mohwa, and the liquor is then called *thul*, is very strong, and is sold for one or two rupees a quart. *Thul* is also sometimes made by redistilling *bangla*. Only one kind of liquor is generally taken from each distillation, as, if the *thul* or *phul* were removed, the spirit subsequently distilled would be not only weak but impure. Strong liquor watered to reduce it to a lower strength is not considered palatable, and it seems to be the usual practice to distill the liquor at the actual strength at which it will be sold. One disadvantage of the cheaper kind of liquor is that it will not keep, and in four or five weeks it is said to lose all its spirituous qualities.

From the statement in the margin it will be seen that of recent years there has been a considerable expansion of the revenue under the head of country spirits. This is chiefly due to the growth of the cooly population, most of whom are spirit drinkers, who increased more than fivefold, during the last twenty years of the nineteenth century. During this period, though there was a large increase in the liquor revenue, there was hardly any increase in the number of shops.

	No. of shops.	Revenue. Rs.
1872-74	38	7,689
1875-80	45	22,765
1885-90	66	42,746
1899-1900	48	1,10,665

The outstill system is not theoretically the most desirable, and its justification lies in the fact that where there are such facilities for illicit distillation and for smuggling, the only system possible is one which, by providing consumers with a moderately priced and reasonably accessible supply of spirit, lessens the temptation to resort to illegal methods to procure it. The following measures have recently been introduced with the object of reducing as far as possible the evils attendant on the liquor trade. A special excise establishment has been entertained, the vendor is required to arrange for an abundant supply of good drinking water near his shop, and his license can be withdrawn if he is twice convicted of allowing drunkenness and disorderly conduct near the still.

The shops for which the highest fees were paid in 1904-05 were Sylhet town, Bhadair Deol (in Kamalganj), Sharergaj and Ramnagar, both of which are in the Matiganj outpost, and Hingajiya. Table XIV shows the number of shops in each subdivision and the revenue obtained since 1900-01. By far the largest revenue is raised in South Sylhet, where there is a large immigrant population. A considerable proportion of the natives of Sylhet are, however, spirit drinkers, as is shewn by the receipts in Sunamganj, where there are very few foreigners, and in Habiganj where their number is not large.

Pachwai, or rice beer, is taken by some of the humble Hindu castes, and is largely used by garden coolies if facilities are not afforded to them for obtaining country spirit. The following is the usual system of manufacture followed.

Pachwai.

The rice is boiled and spread on a mat, and *muli* is powdered and sprinkled over it. After about twelve hours it is transferred to an earthen jar, the mouth of which is closed, and left to ferment for three or four days. Water is then added and allowed to stand for a few hours, and the beer is at last considered to be ready. The usual proportions are—5 seers of rice and 3 chattaks of *muli* to half a *kulsi* of water, and the liquor produced is said to be much stronger than most European beers. Liquor is often illicitly distilled from pachwai or boiled rice, by the following simple method. An earthen pot, with a hole in the bottom, is placed on the top of the vessel containing the pachwai and the whole is set on the fire. The mouth of the upper pot is closed by a cone-shaped vessel filled with cold water, and a saucer is placed at the bottom of the pot over the hole. The vapour rises into the upper of the two jars, condenses against the cold cone, with which the mouth is closed, and falls in the form of spirit on to the saucer beneath. Care must of course be taken to see that the various cracks are closed against the passage of the spiritous vapour, but this can easily be done with strips of cloth.

Opium is generally swallowed in the form of pills or mixed with water and drunk. Madak
Opium. is made by mixing boiled opium with pieces of dried pan leaf, and stirring it over the fire. The compound is then rolled up into pills and smoked. Chandu is made out of opium boiled with water till the water has all evaporated, and is smoked like madak in the form of pills.

The people of Sylhet are not much addicted to the use of opium, and the receipts under this head, which were never large, show a steady tendency to decrease. In 1881 they amounted to Rs. 43,700. The maximum of recent years was reached in 1886 (Rs. 47,400) but from that date onward they gradually declined till in 1902 they had sunk to Rs. 18,800.

The number of shops in each subdivision, the quantity of opium issued, and the revenue raised under this head are shown in Table XIV. Karimganj and North Sylhet are the only parts of the district in which opium is taken in appreciable quantities. In South Sylhet there is only one shop, which sells about ten seers a year; and in Habiganj the quantity consumed is well below one maund.

Ganja is usually mixed with water, kneaded till it becomes soft, cut into small strips, and smoked. Wild ganja grows very freely in the hills, but it is doubtful whether it is much used except as a medicine for cattle. It does not produce such strong effects as the ganja of Rajshahi, but the leaves are sometimes dried and mixed with milk, water, and sugar to form a beverage. Sylhet has always been rather a ganja-smoking district, and in 1884 the revenue raised from this drug in Sylhet amounted to more than half the total receipts from ganja in the Province. The receipts under this head of excise have kept fairly steady, as will be seen from the statement in the margin which shows the most violent fluctuations since 1881. The number of shops in each subdivision, the quantity of ganja issued, and the revenue obtained are

	Rs. (000 omitted)
1881	.. 102
1884	.. 121
1886	.. 68
1892	.. 126
1895	.. 99
1897	.. 128

shown in Table XIV. Unlike opium, the revenue obtained from ganja is fairly evenly distributed over most parts of the district, and the difference between the subdivisional receipts is small.

The receipts under the head of income tax in 1904 amounted to Rs. 53,619, or more than one-fifth of the total collections of the Province. About two-fifths of the whole were assessed on the salaries paid to garden managers and their staff ; and the salaries and pensions of Government servants also yielded over Rs. 6,000. Nearly half the total amount was, however, realized under Part IV "other sources of income," and there were altogether 638 assesseees under this head, or one in every 3,300 of the population. 266 of these persons were described as money-lenders, but most of these people in all probability combined money-lending with agriculture, and there were 68 assesseees in the professional class, nearly all of whom were pleaders. The assessment is made in each subdivision by a Sub-Deputy Collector or Extra Assistant Commissioner, who visits the principal villages and submits his proposals for the approval of the Deputy Commissioner.

The receipts from income tax have on the whole remained fairly steady, but it is doubtful whether there has been much increase in the taxable capacities of the people. In 1888, the receipts amounted to Rs. 61,000 and the maximum was reached in 1898 with Rs. 75,700. The marked decrease which occurred in 1904, and left the income tax demand lower than at any period since Act II of 1886 became law, was due to Act XI of 1903, which raised

the minimum taxable income from Rs. 500 to Rs. 1,000 per annum. The consequence was that the assessment under Part IV was less by Rs. 10,000 in 1904 than it had been in 1888. A statement showing the receipts under this head will be found in Table XI.

The stamp revenue of Sylhet is large, judicial stamps yielding in 1904 Rs. 4,04,000, and non-judicial stamps Rs. 1,52,000, which in both cases was considerably more than half the total amount realized in the Province under this head of revenue. The incidence per head of population was 4 annas, as compared with 3 annas 4 pies per head in Cachar and 1 anna 11 pies in the Assam Valley. This higher incidence is chiefly due to a higher general level of intelligence. In the other districts in the plains the proportion of aboriginal tribesmen or of garden coolies is much greater than in Sylhet, and people of this class have seldom much occasion to attend our Courts. Trade, too, is more decentralized than in Assam where it is concentrated in the hands of a small and united community of Marwari merchants, who endeavour as far as possible to settle their disputes without paying fees to Government or pleaders. The potential number of litigants is thus larger than in other districts, and the complicated condition of the land tenure is a fruitful subject-matter of dispute. The receipts under the head of stamps in 1902 and subsequent years are shown in Table XI.

Public Works are in charge of an Executive Engineer or Assistant Engineer, who is usually assisted by four upper and three lower subordinates. The Public Works Department are

entrusted with the construction and maintenance of all the larger public buildings. The most important are the jail, the public offices, schools and post and telegraph offices at district and subdivisional headquarters, circuit houses, dāk bungalows, and inspection bungalows on provincial roads. Inspection bungalows on other roads are maintained by the Local Boards. The most important lines of communication directly under the Department are the roads from Sylhet to Companyganj and Fenchuganj, the Cachar trunk road as far as Badarpur, and the roads from Habiganj and Maulavi Bazar to the railway stations at Saistaganj and Shamsbernagar. Since 1897, a large outlay has been incurred by the Department on the reconstruction of the Deputy Commissioner's and Judge's courts and the district jail. It has already been explained that Local Board works that require professional skill or engineering knowledge are usually made over to the Executive Engineer for execution.

For general administrative purposes the district is divided into five subdivisions. North
Government. Sylhet is under the immediate charge of the Deputy Commissioner, Karimganj and South Sylhet are entrusted to assistant magistrates who are almost invariably Europeans, and Habiganj and Sunamganj to magistrates who are usually natives of India. The Deputy Commissioner is allowed four subordinate magistrates and three Sub-Deputy Collectors as his assistants at headquarters, and a second magistrate is usually posted at each of the subdivisional stations,

except at Habiganj where there are generally two magistrates in addition to the Subdivisional Officer. The total number of clerks employed under the Deputy Commissioner's orders in 1903 was 181 and they drew altogether from Government nearly Rs. 74,000 in salaries.

In spite of the fact that the district covered an area of nearly 5,500 square miles, a considerable part of which was very densely peopled, Sylhet remained for more than a century under British rule before any attempt was made to decentralize the administration. The question was first mooted in 1860, and it was then admitted that a million and three quarters of human beings could not be adequately governed if all the courts and all the superior officers engaged in the administration were located at one place. Sylhet, the capital of the district, was, moreover, somewhat inaccessible. There were, at that time, hardly any roads, and the difficulties of communication in the cold weather must have been very great ; while even in the rainy season access could only be obtained to the court of the Deputy Commissioner from some portions of the district after a long and tortuous voyage. In 1867, the district was subdivided by notification in the Gazette, into four minor units, *i.e.*, Sunamganj, Karimganj, Habiganj, and what now corresponds to, North and South Sylhet, but no less than ten years passed before effect was given to this order ; want of money being for some time an insuperable obstacle. The first subdivision was opened at Sunamganj in January 1877, and there was evidently,

Administrative
subdivisions.

even at that time, considerable financial stringency, as the Subdivisional Officer elect, who was a European, was informed that he could build himself a cutcherry and a comfortable dwelling house for at most Rs. 2,000 ! The sanctioned subdivisional establishment both here and at Habiganj and Karimganj, which were opened in the following year, were one Sheristadar on Rs. 50 per mensem, one clerk on Rs. 30 per mensem, four clerks on Rs. 20 per mensem, a potdar and a daftri each on Rs. 6 per mensem, and a chaprasi on Rs. 5. Subsequently it was found that the *sadr* subdivision was too large, and in 1882 a fifth subdivision was opened at Maulavi Bazar. The area and population of each subdivision is shewn in the statement in the margin.

	Area in square miles.	Population, 1901.
Sunamganj	1,492	433,753
North sylhet	1,055	463,477
Karimganj	1,048	410,460
South sylhet	840	379,188
Habiganj	999	565,001

The smaller unit of administration is the thana, of which there are 16. The area and population of each thana is shewn in Table II.

Appeals lie to the Deputy Commissioner from the decisions of magistrates of the second or third class, but the duty of hearing these appeals is sometimes delegated to the Subdivisional Officers of Karimganj, South Sylhet, and Habiganj, and to the senior assistant magistrate at *sadr*, who are specially empowered in this behalf. Appeals from first class magistrates lie to the District and Sessions Judge, who is subordinate to the High Court of Fort William at Calcutta. In 1902, there were 16 stipendiary and 2 honorary magistrates in the district and two benches of

magistrates. These magistrates decided altogether 4,455 cases in the course of which 21,594 witnesses were examined. Altogether 5,634 cases under the Penal Code were returned as true, about four-fifths of which were either offences against property or against the human body.

In the chapter on the history of the district, reference has been already made to the unruly character of the inhabitants, and to the prevalence of river dacoity and agrarian riots in the early days of British rule. Unfortunately these characteristics still persist, and there is a marked tendency even at the present day to settle disputes arising out of the complicated land tenure by appeals to force. The matter is generally brought to a head by one party resisting the attempt of their opponents to seize the land or crops, and a curious case occurred in 1882 in which some villagers in the Jaintia Parganas deliberately decided to submit their claims to an ordeal by combat. The day and hour were fixed, and, in the course of the fight, two men were killed and many wounded. A few months later a date was fixed for a similar encounter, but on this occasion the police were informed of the intentions of the parties and intervened to prevent a breach of the peace.

These riots, as a rule, take place between the disputants for the land, but in 1900 the police themselves were attacked at Bhanubhil, near Kamalganj in the south of South Sylhet. Relations between the zamindar and his raiyats, most of whom were Manipuris, had for some time been strained, and a police guard was posted at the

zamindar's cutcherry to preserve the peace. On October 10th, two constables, two village chaukidars, and four zamindari peons who had been sent to enquire into the fate of a missing man, were seized by the villagers and severely beaten. Some of the accused persons absconded, and on October 17th a party of eight policemen, accompanied by three elephants belonging to the zamindar and about one hundred of his men, proceeded to the villages to arrest the guilty persons. On their arrival, they were confronted by a crowd of over a thousand people; and the head constable, who dismounted from his elephant to address the leaders of the mob, was assaulted with a club. The armed police fired their guns into the air, the zamindar's men fled, and the victorious villagers killed a mohurrir of the zamindar's cutcherry, mortally wounded another man, seriously injured seven of the police, and severely beat a number of other persons. The High Court subsequently confirmed the conviction of eleven of the men concerned in the two riots, and imposed sentences of imprisonment varying from seven to two years. Abidabad, Nabiganj, Dirai, Badla, and Astagram have an unenviable reputation for river dacoity.

The average number of murders and culpable homicides annually reported during the ten
Murders. years ending with 1889 was 24. In the next decade the average rose to 31, and during the past four years (1900-03) the average was 40. The largest number of cases occurred in 1901, when there were 48, or 1 to every 46,700 persons. This was nearly three times the rate prevailing in the Province of Bengal.

during that year, but is considerably lower than the rate for Lakhimpur in 1897, when there was one case for every 19,500 persons.

Most of these murders are due to quarrels about women, and not unfrequently the victim is a luckless wife, who, rightly or wrongly, is thought to be unfaithful. The great majority of these crimes are of a senseless and savage character, and the circumstances under which they are committed suggest that the murderer at the time was utterly bereft of sense. A typical case is one reported in 1882. A man abused his wife for neglecting to prepare his evening meal. The woman brooded over her wrongs, and when her husband composed himself to sleep, suddenly seized a *dao* and cut him about the head. She then murdered her infant child, and finished by cutting her own throat. The husband ultimately recovered, but two lives were sacrificed to a petty squabble about uncooked rice. A much more deliberate murder was committed in the following year by a party of Manipuris. A Muhammadan agent of a zamindar in the Muchikandi thana enticed away the wife of a Manipuri Brahman, and declined to give her up when called upon to do. Instead of applying to the magistrate for redress, the Manipuris held a panchayat, and decided that the Muhammadan should be killed as a punishment for seducing or at any rate harbouring a Brahman woman.* On the following morning, some two or three hundred of these people went to the zamindar's cutcherry, on

* In Manipur itself Manipuri women are extraordinarily lax, and adultery is looked upon as a venial fault and is often winked at by the husband.

pretence of having business with the agent. They succeeded in securing two guns which were in the office, and then arrested the object of their vengeance. He was carried out to the market place, mutilated in a horrible manner, and deliberately beaten to death in the presence of the people. The Manipuris then sent for two chaukidars, made over the body of the murdered man to one and his guns and property to the other, and called on them to bear witness that vengeance and not robbery had been their motive. It is satisfactory to know that for this cold-blooded murder and defiance of the law, one man was hung and thirty-three transported for life.

In 1900, a family murder was committed under very curious circumstances. A villager named Bir Singh, was so depressed at the death of his wife, and at the loss of a considerable sum of money which she had buried in a spot which she was unable to disclose before she died, that he determined to put an end to his own life and that of all his children. He accordingly sent away his sister who was mothering the orphaned baby, and arranged his children, who were aged seven, five and two-and-a-half years respectively, in a line, one behind another on the floor. He then sat down in front with the infant slung round his neck, placed the muzzle of his gun at his own heart and pressed the trigger with his toe. The result was the instantaneous death of himself and the two children sitting just behind, but though the bullet lodged in the body of the third child it was too spent to kill her. The infant alone escaped unhurt.

Civil justice is administered by the District Judge assisted by two subordinate judges and ten munsifs. Prior to 1896, there was only one subordinate judge, but an additional officer in that grade was sanctioned in that year as a temporary measure, and he was made permanent in 1903.

Civil Justice.

In 1902, the District Judge decided 12 original cases and 78 appeals, the subordinate judges 498 original cases and 447 appeals, and the munsifs 19,236 cases ; but out of the total number of cases disposed of in all courts only 3,554 were actually contested. In round figures these civil suits were classified as follows:—Money suits 12,000, rent suits 4,000, title suits 3,000. From the pecuniary point of view they cannot be described as of much importance as two-thirds of the total number were valued at Rs. 50 or less.

Sylhet is the only district in the Province in which there is much registration work. The Deputy Commissioner is District Registrar. Special sub-registrars are entertained at the district and subdivisional headquarters and rural sub-registrars at Balaganj, Kanairghat, Jagannathpur, Madhabpur, Jaldhub, Hingajiya, Patharkandi, and Baniyachung. The total number of documents registered in 1903 was 41,500.

Registration.

The Civil Police are in charge of a District or Assistant Superintendent of Police. The sanctioned strength consists of 6 inspectors, 63 sub-inspectors, and 562 head constables and

Police.

constables. 213 smooth-bore Martinis are allotted to Sylhet and a reserve of men is kept up at the district and sub-divisional headquarters who are armed with these weapons and are employed on guard and escort duty. Up-country men, Nepalese, and members of the aboriginal tribes are usually deputed to this work, though attempts are made to put all the constables through an annual course of musketry.

In addition to their regular duties in connection with the prevention and detection of crime, the police are required to check the returns of vital statistics, enquire into cases in which death has not been due to natural causes, furnish guards and escorts, and serve all processes in warrant cases.

The district is divided into 31 investigating centres. The names of these stations and the number of men stationed at each centre will be found in Table XVIII.

There does not appear to have been anything in the shape of a village community in
The Chaukidars. Sylhet in the days of native rule, and there was at that time no village officer corresponding to the chaukidar. Chaukidars were apparently first appointed some time between 1818 and 1838, and in a report submitted in the latter year, they are referred to as a standing institution.*

No attempt seems to have been made to settle the boundaries of the village beats, and there does not appear to have been any efficient machinery for the realization of

* Magistrate's letter No. 263, dated April 1838, to Superintendent of Police.

the village policeman's pay. The natural result was that the force, if force it could be called, was in a very unsatisfactory state. In 1840, the Magistrate complained that the chaukidars could not be made the really efficient branch of the police force they were capable of becoming, until they were constituted the servants of Government and not of the village community.* In 1865, it was said that nothing could be worse than the condition of the rural police, who did not on the average receive more than Re. 1 per mensem. The whole question was taken up by Mr. Luttmann-Johnson when he assumed charge of the district in 1878, and, on his representation, Regulation I of 1883 was passed, to regularize and legalize the position of the village watch. Under this regulation the chaukidar may be paid in kind as well as in cash, he is left to make his own arrangements with the villagers as to the amount of pay he is to draw, and under ordinary circumstances he collects his salary himself. In cases of recalcitrancy the assistance of the magistrate can be invoked, and it is within the discretion of the Deputy Commissioner to appoint a panchayat to represent the villagers if he considers it desirable to do so.

In 1896, Mr. O'Brien, the Deputy Commissioner of Sylhet, who was acting as Inspector-General of Police, reported that the regulation of 1883 had not worked satisfactorily in practice. The chaukidar, if he received his pay at all, neither received it regularly nor in full, he was entirely dependant on his fellow villagers, and

* Magistrate's No. 338, dated 13th April 1840, to Superintendent of Police.

was their instrument and tool and not a servant of the State. Act VI (B. C.) of 1870, was accordingly introduced in North Sylhet in 1898, and has since (1905) been extended to every part of the district. Under this Act the salary of the chaukidar is collected by a panchayat appointed for this purpose. It is then handed over to an officer, who, as a matter of fact, is usually the police officer in charge of the circle, by whom it is made over to the chaukidar. This system tends to improve the condition of the village watch by securing the regular payment of their wages, and at the same time places them more under the control of the police department. The total number of chaukidars employed in Sylhet in 1904 was 5,158, who were entertained at a cost of Rs. 2,67,000.

A Volunteer Corps was first enrolled in Sylhet in 1880 with a strength of 42 members, but was subsequently amalgamated with the Cachar volunteers to form the Surma Valley Light Horse. This admirable corps had a total strength in 1904 of 334 men, 178 of whom were residing in Sylhet.

The Sylhet Jail, which was reconstructed after the earthquake of 1897 at a cost of Rs. 1,86,000, is the largest and best ordered institution of that kind in the Province. The premises, which cover an area of 7·2 acres, are surrounded by a brick wall, and on one side there is a large garden enclosed by a bamboo palisade. The

principal sleeping wards, which are ten in number, are erected on high masonry plinths, the uprights are of iron, and the roof is made of corrugated sheets of the same metal. The walls are of whole bamboos, covered with bamboo shutters which can be raised or lowered at will; and the wards are thus warm in winter while in summer they are airy and cool. Two

of the wards are fitted with wire cubicles which can accommodate 186 prisoners and have been erected at a cost of Rs. 20,000. The number of persons who can be accommodated in the jail is shewn in the statement in the margin.

	M.	F.
Convicts ..	599	15
Under-trial ..	40	5
Hospital ..	55	2
Civil prisoners ..	5	0
Observation cells ..	5	0
Total ..	636	22

The water-supply is drawn from masonry wells, to one of which filtering beds and arrangements for boiling the water are attached, the total cost of the whole being over Rs. 6,000.

The prisoners are employed on gardening, weaving, carpentering, the manufacture of **Jail manufactures.** basket-work furniture and sieves, soorki-pounding, and oil-pressing. Bread and soda water are also manufactured in the jail. The cash earnings of the prisoners in 1903 were said to amount to Rs. 3,561, but this takes no account of the value of goods supplied to other jails, or of raw materials and manufactured articles in store.

The following statement shows the number of deaths that has occurred in each year **Health of Jail.** since 1883, in which the total number

of casualties exceeded ten, and the death-rate per mille on the daily average strength of convicts.

Year.	Daily average strength.	No. of deaths.	Death-rate per mille on the daily average strength.
1883	265	14	53
1884	214	17	79

1900	476	12	25
1901	509	17	33
1902	426	14	33

Between 1881 and 1892, it was the practice to house bodies of prisoners in temporary jails during the cold weather, and employ them on road construction under the Public Works Department. It was thought that change of scene and employment in the open would have a good effect upon their health, and after the system had been placed upon a proper footing this proved to be the case. At first there was some mortality due to the consumption of impure food and water while at work, and to over-exposure, but these defects were soon remedied. The prisoners were supplied with filtered water, prevented from obtaining unwholesome food, and on their return from work were provided with dry and warm clothing, with the result that, except for occasional outbreaks of cholera, the health in these jails was exceptionally good. The effect upon the statistics of

the Sylhet Jail was, however, very striking. Only the weakly prisoners were retained at *sadr*, and men whose health began to fail were sent back from the temporary jails, in some cases to recover, but in some to die. The enormous death-rate shown against 1891 appears to be an instance of the misleading character of statistics when improperly employed. No less than 20 of the 28 deaths occurred amongst prisoners who had returned from the Lushai Hills temporary jail. This temporary jail had a daily average population of 364 in the cold weather, but not a single death was debited against it. There was also a large temporary jail at Telikhal, which was chiefly manned by prisoners from Sylhet, and both of these two jails were omitted when calculating the average daily population and death-rate of the *sadr* jail. Even apart from this statistical confusion it must be admitted that the death-rate was occasionally most lamentably high. In 1895, the actual death-rate amounted to 81 per mille, which was characterised by the Chief Commissioner as appalling, and led to the issue of stringent regulation for the protection of the convicts when employed on extramural labour. In the following year, the death-rate was again high, and the Inspector-General of Jails came to the conclusion that too much regard had been paid to economy by those in charge, and directed that rations should be issued on a more liberal scale. Since that date the health of the jail has been fairly good, except in 1899 when there was a death-rate of 63 per mille. This high death-rate was partly attributed to overcrowding and to the insanitary character of the sheds in which the

prisoners were housed while the jail was under reconstruction, and partly to the prevalence of a peculiarly malignant form of malarial fever in the town. The arrangements in the jail are now quite admirable, and of recent years the death-rate has been low.

At the headquarters of each subdivision there is a jail in which male convicts are allowed to be detained for three months, and female convicts for one. Persons sentenced to a longer term of imprisonment are transferred to the jail at Sylhet. The wards are constructed on high mud plinths, and have iron posts and roofs and bamboo walls, and are situated in an enclosure surrounded by a bamboo palisade. The statement in the margin shows the area of the premises and the number of prisoners for whom accommodation is provided. The prisoners are usually employed on gardening or cleaning the drains and repairing the roads of the town; and, inside the jail, are sometimes put to paddy husking and the mustard oil mill. Table XIX shows the population, the mortality, and the financial results of each jail in 1881, 1891, and 1901.

In the days of native rule there were a large number of village schools, in the district, where children were taught to read by the local Pundit or Maulavi and were instructed in the mysteries of Sanskrit or the Koran. For many

Education.

years after our occupation of the country, these indigenous and unaided schools were the only ones the people had, and education on the English system is a plant of comparatively recent growth. In 1867, or less than forty years ago, there were only 28 schools and 1,127 scholars in the district. * Nearly half of these children were living in Sylhet town, so that amongst the millions in the mofussil, education on the English system might be said to be almost non-existent. The following abstract shows the development of education since 1874 ; and how the 1,100 pupils of 1867 had increased to nearly 40,000 in 1901. The figures for later years will be found in the appendix (Tables XX).

Years.	Number of secondary schools.	Pupils.	Number of primary schools.	Pupils.	Total No. of pupils.	Number of persons in district to each pupil.	Percentage under instruction to those of school-going age.

High schools are those institutions which are recognised by the Calcutta University as capable of affording suitable preparation for the Entrance Examination. The boys are taught from the earliest stage of their education up to the En-

* Principal Heads of the History and Statistics of the Dacca Division, page 326.

trance course as prescribed by the University of Calcutta, but many leave school without completing the course. Till recently English was taught in all the classes. The smaller boys no longer learn that language, but the standard of instruction is higher than that prevailing in lower secondary (middle) schools. English is the medium of instruction in the first four classes of high schools; in the lower classes and in other schools the vernacular is employed. The course of instruction at middle English and middle vernacular schools is the same, with the exception that English is taught in the former and not in the latter. The following are the subjects taught in the middle vernacular course :—(1) Bengali comprising literature, grammar, and composition, (2) History of India, (3) Geography, (4) Arithmetic, (5) Elements of Euclid (Book I), mensuration of plane surfaces and surveying, and (6) simple lessons on botany and agriculture.

Primary education is again divided into upper and lower, but the proportion of boys in upper primary schools is less than six per cent. of the total number, and this class of school, like the middle vernacular, is slowly dying out. The course of study in lower primary schools includes reading, writing, dictation, simple arithmetic, and the geography of Assam. In Upper Primary schools the course is somewhat more advanced, and includes part of the first book of Euclid, mensuration and a little history. The standard of instruction given still

leaves much to be desired, but efforts have been recently made to improve it, by raising the rates of pay given to the masters. Fixed pay is now awarded at average rates of Rs. 8 per mensem for certificated and Rs. 5 per mensem for uncertificated teachers, supplemented by capitation grants at rates ranging from 3 annas to 6 annas for pupils in the three highest classes.

Sylhet is fairly well supplied with secondary schools.

**Sites of College
and principal
schools.**

The Murarichand second grade unaided College in Sylhet town was founded by Raja Girish Chandra Roy in 1892 and is supported by that gentleman. There is a Government high school at Sylhet, aided high schools at Habiganj, Sunamganj, Maulavi Bazar, and Karimganj, and unaided high schools at Sylhet and Baniyachung. There are also one Government, 40 aided and 4 unaided middle English schools, and 14 schools which are classified as middle vernacular. A list of these schools will be found in the Appendix. In 1901, the proportion of literate males was 81 per mille, which was higher than that in any district of the Province, with the exception of the Cachar Plains. Female education has made very little progress, and only four women in every thousand were returned as literate at the last census.

The district is in the medical charge of the Civil Surgeon who is stationed at Sylhet.

**Medical. General
sanitary conditions
of the district.**

It contains 43 dispensaries, and the supervision of the work done at these institutions is one of the most important of his duties. He

also acts as Superintendent of the Jail and Leper Asylum, he controls and inspects the vaccination department, and is required to visit and report on all tea gardens on which the death-rate for the previous year has exceeded 7 per cent.

The conditions under which the majority of the people pass their days are far from conducive to a long term of life. Their houses are small, dark, and ill-ventilated, and the rooms in summer must be exceedingly close and oppressive. They are built upon mud plinths, and are in consequence extremely damp, and the poorer people, instead of sleeping on beds or bamboo platforms which would cost but little to provide, often pass the night on a mat on the cold floor. The houses are buried in groves of fruit trees and bamboos, which afford indeed a pleasant shade but act as an effective barrier to the circulation of the air, and increase the humidity of the already over humid atmosphere.* Sanitary arrangements there are none, the rubbish is swept up into a corner and allowed to rot with masses of decaying vegetation, and the complete absence of latrines renders the neighbourhood of the village a most unsavoury place. The water-supply is usually bad and is drawn either from rivers, or from tanks in which the villagers wash their clothes and persons. Hindus are generally burnt upon the river bank, and the mattress on which the corpse was carried to the pyre is left to rot upon the ground, to be carried off in the next flood

* The Civil Surgeon has found that excellent results have attended the clearance of bamboo jungle in places where fever has been particularly bad.

with all the germs of disease it may contain. In the cold weather the carcasses of dead cattle are thrown into the river, and the Civil Surgeon has seen more than sixty in a single trip from Karimganj to Fenchuganj. These masses of decaying matter often drift into back eddies, where they thoroughly pollute water which is often subsequently used for all domestic purposes. All of these are undoubtedly factors which contribute to produce a high mortality, and nearly every one of them could be eliminated.

Vital occurrences are reported verbally by the village chaukidars to the police, but the accuracy of the statistics leaves much to be desired. In 1902, enquiries were made by the testing staff with regard to 34,000 births and deaths, and it was found that 6 per cent. of them had been omitted from the registers. The mean recorded birth-rate for the decade, 1891-1901, was 34, and the death-rate 33 per mille.

The diseases which are most common in the district are fevers of various kinds, small-pox, chicken-pox, measles, cholera, dysentery and diarrhoea, skin diseases, and worms. Enteric and gastric fevers, dengue, and diptheria are seldom met with. Fevers are divided into three main classes: intermittent fever with ague, remittent fever which generally lasts some fifteen days with a long and tedious convalescence, and *kala azar*, which is here known as *pet mota* or *mulki pira*. *Kala azar* has been prevalent for many years in the Brahmaputra Valley and has produced the most appalling mortality in the Garo Hills and in Lower and Central

Principal diseases:
Fever.

Assam, but till comparatively recently it was thought that Sylhet was free from the disease.

In 1897, after the great earthquake, malarial fevers became extremely common, and some of them assumed a malignant and fatal type which was not amenable to ordinary treatment. The people themselves looked upon this fever as a new disease, and after some enquiry the Medical Department came to the conclusion that it was probably identical with the dreaded *kala azar* of Assam. Their uncertainty was due to the fact that it is difficult to distinguish between *kala azar* and ordinary malarial fever, the principal points of difference being the ease with which it can be communicated from the sick to the healthy, the extreme condition of cachexia which is rapidly induced, and the small proportion of recoveries. As to the exact nature of the disease the medical profession is still in doubt: as to the appalling effects it can produce there is unfortunately no question.

The fever in Sylhet is of a remittent type, the spleen and liver are enlarged, the complexion is of a leaden hue, and there is considerable wasting of the muscles. The disease is not so widespread or of such a fatal type as the form that is found in the Brahmaputra Valley, but it is said to be intensely prevalent in some portions of the district. The mortality in 1897 was very high in Sylhet, but that year was an exceptionally unhealthy one in every part of the Province, and since that date the health of the district has been fairly good. Serious outbreaks of fever also occurred in 1879, and again in 1884 and 1885. For the present at any rate, the North

and South Sylhet subdivisions appear to be the most feverish portions of the district. The inhabitants of Habiganj and Sunamganj enjoy better health, possibly because almost the whole of the country goes under water in the rains.

Cholera appears every year in the Habiganj, Sunamganj, and North Sylhet subdivisions and is a regular visitor to the police stations of Jagannathpur, Dirai, Baniyachung, Nabiganj, and Biswanath. The disease is generally most severe in the autumn when the floods are drying up, and its dissemination is assisted by the careless habits of the people and the reckless way in which they allow their drinking water to be polluted. On the outbreak of an epidemic, native doctors are sent amongst the people, and efforts are made to prevent the villagers from flinging carcasses and dead bodies into the *haors* and rivers. The district is, however, fairly free from cholera. Only four times in the last twenty years has the recorded death-rate from this disease exceeded 4 per mille, and not once has it been as high as 5 per mille, but in 1870 there was such a violent outburst of this dreadful epidemic that the Magistrate closed the courts for 17 days. Small-pox of course exists, but the mortality is far from high, and virulent outbreaks are not so common as in other parts of the Province. It is perhaps on this account that the inhabitants seem a little indifferent to the advantages of vaccination. In the five years ending with 1902-03, only 34 per mille were on the average annually protected as compared with 44 per mille in the Province as a whole. Skin diseases

are very prevalent and so are worms, the uncleanly habits of the people rendering the dissemination of the ova a very simple matter. The parasites most generally found are the round worm, the tape-worm, the whip-worm, and the *anchylostomum duodenale*. Goitre and elephantiasis are very rare, but venereal diseases are said to be fairly common.

The native methods of midwifery leave much to be desired. The old Hindu Ayurvedic system seems to have prescribed a fairly reasonable treatment. The hut in which the patient was confined was to be newly erected for the occasion, fairly spacious, well ventilated and dry; the bedding was to be clean, and the attendants were required to cut their nails and wear clean clothing. After delivery the mother was to be carefully tended, and protected from anything likely to retard recovery till her health was properly restored. In the case of unnatural presentations the infant should be thrust back into the uterus and turned if possible, and when this proved to be impracticable, it was dismembered and brought out in pieces.

At the present day the practice of erecting a new hut is often disregarded, and, where one is built, it is generally of the most unsanitary description; but in many families a dark and ill-ventilated room which is attached to the main house is specially reserved for lying in. The patient is attended by low caste widows who are ignorant and uncleanly. In a natural and easy labour they have not much opportunity of doing harm, but where delivery is retarded, they often do much injury

alike to mother and to child. They generally endeavour to induce the premature expulsion of the placenta and thus cause hæmorrhage which is sometimes fatal. The mortality of mothers in child-birth is said to be considerable. The zenana system is supposed to have a prejudicial effect upon female health, early marriage is common, little girls become mothers before they are fitted to support the strain, and the shock of parturition not unfrequently is fatal to a constitution already weakened by malaria. Septicæmia is often caused by the uncleanness of the surroundings of the mother and her attendants, and the treatment after delivery is generally most injudicious. The patient, instead of being allowed to rest in quiet, is encouraged to move about, and often takes a cold bath in the tank before the house. Midwives from Behar and Upper India are reported to be not quite so ignorant and unskilful as those of Bengal.

The Ayurvedic system of medicine is said to have fallen into disrepute owing to the ignorance of the Kabirajes who are its principal exponents. The medicines are generally prepared from iron, silver, copper, arsenic, sulphur, mercury, from plants and trees, and sometimes from cobra poison. A native doctor who has now retired from Government employment reports that he has found the use of cobra poison to be attended by the most excellent results. Ganaks treat cases of small-pox, chicken-pox, and measles, but decline to reveal their methods. Ojhas attempt to cure the sick by incantations, and Mullas by reading the Koran in a chorus.

**Native medical
methods.**

Though there can be little doubt that many lives are annually lost which could be saved by proper treatment, it is satisfactory to know that of recent years there has been a great increase in the facilities for obtaining medical aid, and in the extent to which the people avail themselves of the advantages now offered to them. The first dispensary was opened in Sylhet in 1863. From the statement in the

margin it appears that for every patient treated in 1881 there were 17 in 1901, while the number of operations performed rose from 390 to

	Dispensaries.	Patients
	No.	treated
	No.	No.
1881	4	13,553
1891	24	152,732
1901	43	230,996
1903	43	267,329

8,068. The principal dispensaries are those situated at Sylhet, Maulavi Bazar, Rabir Bazar, Habiganj, Sunamganj, Srimangal, and Kulaura, each of which had a daily average attendance in 1903 of more than 40 persons, while Sylhet headed the list with 81. The diseases for which treatment is most commonly applied are worms, cutaneous disorders, malarial fevers, diseases of the eye, dysentery and diarrhœa, and rheumatic affections. Further details with regard to the medical administration of each subdivision will be found in Table XXII, and with regard to each dispensary in Table XXIII. Table V shows the registered mortality from certain of the principal diseases. The figures are not correct but give some idea of the comparative value of these different ailments as lethal agents. Of recent years the district has been fairly healthy and since 1899 the recorded birth-rate has generally exceeded the recorded death rate by about 8 per mille.

An asylum for the reception of lepers was opened at Sylhet in October 1898. It is situated on the north bank of the Surma on the outskirts of the town, and consists of twenty small *cutcha* houses which can accommodate 18 single lepers and 14 families. Under the Lepers Act III of 1898 pauper lepers may be sent to the asylum from Sylhet, Sunamganj, Karimganj, Maulavi Bazar, and Habiganj, and from Silchar and Hailakandi. Twenty lepers were under treatment in the asylum at the end of 1903.

The following is a list of the various measurements and surveys which at different times have been made of different portions of the district :—

- | | | | | |
|----|---|-----|-----|--------------|
| 1. | Hastobad by Mr. Willes | ... | ... | 1788 to 1790 |
| 2. | Halabadi (a) partly by Mr. Ward | ... | ... | 1820 |
| | (b) " " " Tucker | ... | ... | 1822 to 1829 |
| 3. | Lieutenant Fisher's Survey of <i>ilam</i> lands | ... | ... | 1827 to 1834 |
| 4. | Survey for the resumption of invalid Revenue-free grants by deputy collectors | ... | ... | 1836 to 1840 |
| 5. | Lieutenant Thuillier's Survey of Jaintia | ... | ... | 1837 to 1840 |
| 6. | Ditto 11 parganas of Zilla Latu | ... | ... | 1842 |
| 7. | Takbast Survey | ... | ... | 1859 to 1866 |
| 8. | Survey of <i>ilam</i> and other petty temporarily settled estates in the district by deputy and sub-deputy collectors | ... | ... | 1871 to 1880 |
| 9. | Survey of Jaintia by Mr. Beckett | ... | ... | 1875 to 1878 |

10. Topographical Survey of the hills in the Karimganj, South Sylhet, and Habiganj subdivisions by Major Badgley and Colonel Woodthorpe 1877 to 1883
11. Survey to test the accuracy of the *takbast* measurement by Mr. P. A. G. Cowley 1882
12. Cadastral Survey of pargana Pratapgarh by Mr. Barrett 1891 to 1892
13. Cadastral Survey of Jaintia Parganas by Mr. Barrett 1892 to 1893
14. Cadastral Survey of *ilam* estates in Sylhet Proper, by Babu G. C. Das, E.A.C. 1896 to 1897

The revenue survey of 1859—1866, which is generally spoken of as the *takbast*, is of considerable importance, as the maps and papers have on more than one occasion been held by the Civil Courts to be valuable evidence of possession and title. It was never confirmed, as required by section 4, Act IX of 1847 ; but, in spite of this, it is the general policy of Government to decline to recognise any claims to land which was not included in the purview of its operations.

* The outpost Goyainglit, which in 1891 was under the Kanairghat thana, has been transferred to the *Sadr* thana. The figures for 1891 have been corrected.

† Hauli Satrasati pargana, which in 1891 contained 4,283 persons, has since been transferred to the Moulavi Bazar thana. The figures for 1891 for these two thanas have been corrected accordingly.

‡ The total area of the district is probably about 5,435 square miles but the Survey Department are unable to guarantee absolute accuracy in a matter of this kind.

PREFACE.

The Gazetteer of Goalpara is nothing more than a general description of the district as a whole, and does not, as Gazetteers generally do, include a directory. There are, however, hardly any places in the district which are worthy of the name of town, and the little villages in which the people live do not call for a separate and detailed description. Places which are centres of local trade or of some industry have been specified by name, but to attempt to describe each of these villages would merely have resulted in the most tedious iteration. It should be added that the Gazetteer was compiled at a time when Assam was still a separate Province, and that when the Province is mentioned it is to Assam and not to Eastern Bengal and Assam that reference is made. My acknowledgments are due to the Deputy Commissioner for his kindness in examining the work in proof.

SHILLONG : }

B. C. ALLEN.

CONTENTS

CHAPTER I.

PAGE.

Physical Aspects.

Area and boundaries—General aspects—Mountain system—
River system—Bills and marshes—Geology—Climate—
Winds and Cyclones—Rainfall—Earthquakes—Fauna. 1-15

CHAPTER II.

History.

Summary—Legendary history—The Koch kings—Their
decline—Invasion of Goalpara by Ahoms—Conquest by
the Muhammadans—Relations between British and
Ahoms—The Eastern Duars—The Garo frontier—
Changes in jurisdiction—Archæology. ... 16-30

CHAPTER III.

The People.

Area and density—Towns and villages—Growth of popu-
lation—Migration—Sex and marriage—Infirmities—
Language—Caste and tribe—Religion—Hindu sects—
Temples and Dhams—Animism—Muhammadanism—
Christianity—Other Religions—Occupations. ... 31-61

CHAPTER IV.

Agriculture and Forests.

Crops grown—Rice—Mustard—Pulse—Fibres—Storage and
threshing of grain—Agricultural implements—Sugar-
cane—Preparation of molasses—Causes affecting the
productiveness of land—Garden crops—Tea—Yield

and value of crops— General remarks—Live stock—	PAGE.
Forests—Classification of reserved forests—System of	
management 	62-83

CHAPTER V.

Arts and Industries.

Industries—Silk—Pottery—Brass and bell-metal—Weaving—	
Lac—Mat-making—Fishing. 	84-91

CHAPTER VI.

**Economic condition of the people,
Communications, Trade,
Towns and Local Boards.**

Rents—Wages—Prices—Food and dress—Dwellings—Econo-	
mic condition of people—Conventional restrictions—	
Means of communication—Railways—Roads—Post and	
telegraph—Trade—Markets and fairs—Towns—Local	
Boards. 	92-108

CHAPTER VII.

General Administration.

Land revenue—The permanently settled estates—History of	
the great zamindaries—The Eastern Duars—Land	
revenue collection,—Town-lands — Excise — Opium —	
Country-spirit—Laopani—Ganja — Income-Tax — Stamps	
—Public Works—Government—Criminal and civil justice	
—Registration—Police—Jails—Education — Medical —	
Vital statistics—Surveys. 	109-145

CHAPTER I.

PHYSICAL ASPECTS.

Area and boundaries—General aspects—Mountain system—River system—Bils and marshes—Geology—Climate—Winds and Cyclones—Rainfall—Earthquakes—Fauna.

THE district of Goalpara is bounded on the north by Bhutan; on the east by Kamrup; on the south by the Garo Hills; and on the west by the Bengal district of Jalpaiguri, by the native state of Kuch Bihar, and by the Bengal district of Rangpur. It lies between 25°, 28' and 26°, 54' N. and 89°, 42' and 91°, 6' E. and covers an area of 3,954* square miles.

Area and boundaries.

The greater part of Goalpara consists of a level plain, the lower portion of which is intersected by the Brahmaputra. A few outlying spurs of the Assam range project towards the river, and even appear on the north bank, in the Khuntaghat and Parbatjuar parganas. Near the Brahmaputra, much of the country is exposed to flood and is covered by a dense growth of grass and reeds. Further back, the level rises and rice fields take the place of swamps. The houses of the cultivators are buried in dense groves of areca palms, plantains, and bamboos, and at all seasons of the year the country looks fresh and green. The Eastern Duars, at the foot of the Bhutan Hills, is a country of grassy commons

General aspects.

* Revised figures which do not agree with those returned in the Census Report of 1901.

and dark forests. Rice is grown on fields that are irrigated from the hill streams, and here and there the villages of the Meches, the inhabitants of that tract, are to be seen standing up against the sky line. But the Duars are very sparsely populated, and are for the most part covered with jungle grass or forest.

**Mountain
System**

The northern and western portions of the district are absolutely flat. On the east, there are several low ranges projecting from the Garo Hills, which reach right down to the river near Goalpara town, where there are isolated hills projecting above the alluvium from four to seven hundred feet in height. Immediately north of the Brahmaputra, these hills again appear, but they here attain a higher altitude. The Bhairab hill is 1,647 feet above the level of the sea. The Narikola, a little to the east is, 1,146 feet, while the Bao Kumari, the highest peak in a collection of small ranges in the west of the Khuntaghat pargana, is 1,505 feet. The only elevated tract in the Eastern Duars is a low range of hills in the extreme south of the Sidli Duar. These hills all rise sharply from the plain, and, though there are few actual cliffs, their sides are rocky and precipitous. As is only natural in the rainy climate of Assam the summits and sides alike are covered with forest and with bamboo jungle.

**River
System.
The Brahma-
putra.**

The principal river of Goalpara, as of every other district in the Assam Valley, is the Brahmaputra, which flows either through or along the boundary of the district, for a distance of 85 miles. Few rivers allow

themselves greater latitude in their wanderings than the Brahmaputra, as it oscillates from side to side of the sandy strath through which it makes its way. Here it cuts away a great bank, there it throws up a *chur*, which may either be carried away by the next flood, or may grow into a large island covered with grass and reeds. It enters the district on the south bank a few miles below Nagarbera in Kamrup, and on the north bank at the mouth of the Manas, which is nearly opposite the town of Goalpara. Its course through the district is at first from east to west, but after running about sixty-five miles, it turns to the south-west and finally to the south. The river is crossed by the steam ferries which ply between Dhubri and Fakirganj and Goalpara and Jogighopa. Such is the breadth of the river in the rains that the crossing to Barabhitā, about one mile above Fakirganj, takes $1\frac{1}{2}$ hours, though the ferry boat can steam some ten miles an hour in slack water.

The Manas is probably the largest of the rivers which join the Brahmaputra in the Goalpara district. It rises in the Bhutan Hills, and originally formed the boundary between Goalpara and Kamrup, but its channel is subject to frequent changes, and for the greater part of its present course it flows through Goalpara. The principal tributaries are—on the right bank the Makra, Dalani, Ai, Pomajan, Bhandura, and Koija, and on the left bank the Chaulkhoa. The banks are, as a rule, covered with jungle, and the river is not much used as a trade route above its junction with the Ai. Boats of fours tons burthen could, however, go as far as Mokhoa

**The Manas
and Ai.**

at all seasons of the year. The total length of the Manas is about 200 miles. The Ai or Gabharu rises in the Bhutan Hills and flows a tortuous course, first south and then south-east, till it falls into the Manas at the extreme north-east corner of the Khuntaghat pargana. Its principal tributaries are the Buri-Ai and Kana-mukra, both of which join it on the left bank. A boat of four tons burthen can proceed as far as Koliagaon in the rainy and Chamugaon in the dry season; and the river affords a recognised outlet for rice, mustard, thatching grass, and timber.

**The
Champamati
and Saral-
bhanga.**

West of the Manas, the Brahmaputra is joined by the Champamati and the Saralbhanga, which in the lower part of its course takes the name of its principal tributary the Gaurang. Both of these rivers issue from the Bhutan Hills, and when first debouching on the plain, flow over wide stony beds, where the water disappears from time to time in the loose gravelly soil, to re-appear again at some distance further on. In the rainy season the Champamati is navigable by a boat of four tons burthen as far as Garubhasa, and the Saralbhanga as far as Patgaon. The principal tributaries of the Champamati are the Bhoor and the Lopani, both of which join it north of the trunk road. West of the Saralbhanga are the Hail, the Gangia, and the Ranga, which unite to form a stream which, under the name of the Sankosh, falls into the Brahmaputra near Bagribari.

The Sankosh

The greater Sankosh is, however, a much larger river, which forms the boundary between the Ripu Duar and

the Jalpaiguri district of Bengal. At Maktaigaon, it divides into two branches. The western arm retains the name of the original river, and, after flowing through Jalpaiguri and Kuch Bihar, rejoins the eastern branch, which is called the Gangadhar, near Patamari. The combined stream is then known as the Dudhkumar, and falls into the Brahmaputra below Dhubri. For the greater part of its course it flows through jungle land, and is thus not largely used as a trade route, though timber and other forest produce is brought down it. The total length of the river is about 200 miles. About four miles south of Tamarhat, it throws off a channel to the east, which is known as the Gadadhar and falls into the Brahmaputra immediately to the east of Dhubri town. These are, however, but the principal rivers north of the Brahmaputra. The whole of the Eastern Duars is a net work of minor streams and water courses, many of which dry up in the cold season.

West of Goalpara town the drainage of the Garo Hills is carried to the Brahmaputra by the Karnai, the Phulnai, the Kalpani, the Dudhnai, with its tributary the Krishnai, and the Jinari. East of Goalpara, the drainage from the south is first collected in the Jinjiram, which rises in the Urpada *bil* and flows parallel to the Brahmaputra till it joins it a little to the south of Mahendraganj. The Jinjiram is largely used as a trade route, and a boat of four tons burthen can go as far as Singimari in the dry season, and in the rains right up to Lakhipur.

The rivers
on the South
bank.

Bils and marshes.

In the permanently settled portion of the district there are a large number of *bils*, the more considerable of which almost attain the size of lakes. The largest are the Dalni and Tamranga *bils*, which lie at the foot of the Bhairab hills in the Khuntaghat pargana. In the rains, these two *bils* merge into one, and form a magnificent sheet of water from five to six miles long and one or two in breadth. Bounded as they are on the west by a range of precipitous hills about 1,600 feet in height, the appearance of these little lakes is very picturesque. About eight miles further west there is the Dhir *bil*, while the Dhiple *bil*, about three miles further on, is another fine sheet of water, which lies at the foot of the Baokumari hills. South of Goalpara, there is the Urpada *bil*, which almost attains to the dimensions of a lake. Other smaller marshes are the Jaligaur, the Kumaria, the Bakdul, the Digaldubi, the Kishia, the Padmapara, the Kadamtala, and the Hasila.

Geology.

The soil of the plains is composed of sand and clay in varying proportions, ranging from pure sand near the Brahmaputra to a clay so stiff as to be quite unfit for cultivation. In the Duars, the soil is for the most part light and gravelly. The hills are of gneissic origin and contain large rocks which would make a good building stone.

Climate.

The climate of Goalpara, as is only natural, differs considerably from that of Upper Assam. The winter is comparatively warm, and in March and April the temperature is fairly high. In the latter month, the

average maximum is nearly 89° , or over 9° more than it is in Dibrugarh. This is, however, the highest maximum for the year, and in no other month does it exceed 86° Fahrenheit. The diurnal range between May and September is very small, and between July and September it is only 8° , as compared with 21° in January. The maximum and minimum temperature of each month at Dhubri will be found in Table I.

The prevailing winds are easterly, but hot winds Winds and Cyclones. blow from the west in the months of March, April, and May. On April 18th 1900, a cyclone of extraordinary violence swept over a portion of the south bank. The storm crossed the trunk road at a point 22 miles, south of Fakirganj. The total area affected in the Goalpara district was a strip of land about five miles long by half a mile in width. In the central portion of the storm path, which was about a quarter of a mile broad, practically everything was demolished. 110 houses were wrecked, 88 persons were injured, two of them fatally, and 30 persons and 33 cattle were killed outright. Many of the killed had their skulls smashed in, and two of them were completely torn to pieces. One of the corpses is said to have been blown right across the Jinjiram river, and carried a distance of more than a quarter of a mile. Trees, too, were uprooted and carried away, one being a banyan tree, nineteen feet in circumference and thirty feet high, which was torn up by the roots and carried along ten yards. Phulerchar and Baroalga were the villages which suffered most severely, eighteen persons being killed in the former, and

ten in the latter. On the following day, there was another violent cyclone which lasted for about ten minutes and followed the same line of country. On this occasion the Goalpara villages escaped with comparatively little injury, but eight persons were killed in the neighbouring district of the Garo Hills.

Rainfall. The average monthly rainfall recorded at Dhubri and at four other stations in the district will be found in Table II. At Dhubri it is only 95 inches in the year, but at Kachugaon, near the Bhutan Hills, it is about 60 inches more. Even at Marnai, which is only about 30 miles north of Dhubri, it is 140 inches. About nine tenths of the total rainfall at Dhubri is precipitated in the five months, May to September. In the four months, November to February, there is only just over one inch of rain. The heavy rainfall in May, which varies from 14 to 20 inches in different parts of the district, is a notable feature in the meteorology of Goalpara.

**Earth
quakes.**

Goalpara, like the rest of Assam, has always been subject to earthquakes. McCosh, writing in 1837, stated that a few years previously a village near Goalpara town had been completely swallowed up.* Such was the story told by the people of the neighbourhood, but for its accuracy few would care to vouch. All previous seismic disturbances were, however, insignificant in comparison with the great earthquake of 1897. This earthquake was felt over an area of 1,750,000 square miles, from Rangoon in the

* Topography of Assam page 74.

south-east to Kangra in the north-west, from the Himalayas to Masulipatam, and serious damage was done to masonry buildings over an area of 145,000 square miles.* The area of maximum disturbance was a tract of country, of the shape of a cocked hat, whose base line ran from Rangpur to Jaintiapur, while the top of the crown was near Barpeta. The shock occurred at about 5 P.M. on June 12th 1897, and lasted for several minutes. Most of the masonry buildings in the district were wrecked, but *cutcha* structures escaped with comparatively little damage. In Goalpara, the Subdivisional Officer's bungalow, the circuit house, the treasury, the school, and the post and telegraph offices were all demolished. The bazar sank, and the whole of the town went under water; the people being compelled to live like birds on bamboo platforms erected near the roofs of their houses. Substantial dykes have since been constructed, and the town is now protected from inundation in the rains. Serious injury was done to all masonry buildings at Dhubri. The foreshore was broken up by enormous fissures, wells were cracked and filled up with sand, and sand and water spouted from the earth. Fortunately the loss of life was very small, and the total number of casualties was only five. The following extract from a letter written by the Civil Surgeon, gives a graphic description of the effects of the shock south of the Brahmaputra.

At 5 p. m. came this terrible earthquake. I invariably sit out an earthquake, as I have always thought the worst is over before one has time to get outside a house, but though I was safe

* Memoirs of the Geological Survey of India, Vol. xxix, p. 52.

enough in the light shanty I was in, I had to rise, as the shock seemed never ending, and a roar of water flowing near and the hum of voices compelled my getting up. The villagers were panic-stricken and fleeing from their houses to the Trunk Road. The ground I at once saw was everywhere cracked up, sunk, etc. Behind the old rest-house is the termination of a very long *bheel*. It was a wonderful sight, this *bheel*. The water rose steadily in it, and in two minutes must have risen at least twelve feet and then overflowed, and with this overflow, the whole country, as far as the eye could see on each side of the Trunk Road, was one sheet of water. The fact being that from all the innumerable cracks water had gone on spouting, and that, coincidentally with the overflow of this *bheel*, the water level had risen to the same height all over the surrounding country.

In addition to the cracks from which the water welled up carrying the sand with it, innumerable jets of water, like fountains playing, spouted up to heights varying from 18 inches to quite $3\frac{1}{2}$ or 4 feet. Wherever this had occurred, the land was afterwards seen to occupy a sandy circle with a depression in its centre. These circles ranged from 2 to 6 and 8 feet in diameter, and were to be seen all over the country. In some places, several were quite close together; in others they were at a distance of several yards apart. They had the appearance of small craters. I have heard it said that the water from the cracks and these so-called fountains was warm, almost hot, but this must be due to someone's imagination: I had to wade through a good deal of water whilst the water level was rising, and had the temperature of the water been abnormal, it must have made itself felt to me. It must not be overlooked that the country had been water-logged days before the earthquake came, and that it must have been this water which was driven up with the subsidence of the land, as I believe the quake was due to a subsidence.

In front of Jemadarhat rest-house the Garo Hills, are within 5 miles, and behind it is the Brahmaputra at a distance of not more than 2 miles. The Trunk Road remained above water, but in certain portions where it had subsided from 1 to 2 feet the water flowed across it, and at these places, where the panic-stricken villagers tried to run towards the direction of Lakhipur, which is 12 miles off in the Gauhati direction, the poor creatures got more alarmed than ever, for they found themselves sprawling about in the water, unable to realise what had barred their progress, and not knowing if they were going to get out of it again. At all these gaps or places, where the earth had subsided, or where fissures and cracks had formed, the rush of water from

them all carried with it an immense quantity of sand, and this was what barred the progress of these panic-stricken villagers. This sand had a particularly quicksandish feel about it, but fortunately, as a rule, was not deep on the portions of the road that had subsided near the rest-house.

The main shock seemed to me to have lasted nearly six minutes, but perhaps in this I am wrong, and perhaps I may have missed a cessation and taken two or more shocks as one, for certainly I noticed no cessation. It seemed as though death from drowning must have been the end of every one near me. Although the shocks went on being repeated incessantly at intervals of a few minutes, the rise in the water ceased after half an hour, and then the idea present to one's eye was that the country on either side of the road was nothing more than innumerable sand-churs of different sizes, such as are met with in the Brahmaputra. This meant, of course, that crops were considerably covered by this sand. Most of the excavations made by the earth-cutters annually on each side of the Trunk Road to enable them to throw fresh earth on to it have been filled in by this sand, and the Public Works Department will not have quite such heavy rates to pay for earth-cutting, as the leads will be comparatively short when they begin work again ; but for this, which is really no advantage to speak of, the loss to the province must be enormous.

All the panic subsided by about 9 o'clock ; the hut I was originally in was now under water, and I could not get back to it. Many of the villagers' houses and those of the Kayas had sunk a good deal, whilst others filled with two or more feet of sand through the door ways. My horse broke away towards the end of the first shocks, and made for home, the syce after her as hard as he could go, but on reaching a good strong wooden bridge, she was stopped by the bridge subsiding on the Dhubri side. Cattle seemed to find great trouble in extricating themselves from the sand and water, which but a few minutes before was their grazing ground. Villages were wholly vacated and refuge taken wherever high land was available. Almost everything is said to have its ludicrous side, and in the midst of confusion and the marked panic of the villagers, it was amusing to find my cook busy at work preparing dinner within half an hour of the occurrence. There he was, as though nothing had occurred, on the plinth of a burnt down hut only just above water and surrounded on all sides by it. I was very grateful to him later on for not having parted with his wits.

As the rush of water ceased and order was to some small extent renewed, those who were able to do so scrambled to their

huts, and brought out boxes and bedding, etc., etc., and, with their belongings, encamped on the road for the night. At about 10 it struck me I might have a roof over my head if I got near the ferryghât, as there was a tumble-down serai there. I had gone half a mile when two men assured me it was impossible for me to progress, owing to a gap of several feet in the road through which water flowed, and across which they had just swum. On hearing this, I returned, and with my bed on the road, attempted to get some rest. This was impossible, with the continuous and oft-repeated seismic shocks at short intervals, which, whenever the least bit strong, were followed by a wail of human voices. Cattle, goats, and dogs formed a goodly addition to those resting on the road for the night. At 2 a. m. a sharp drizzle came down, and with my umbrella over my face and a rug over my body, I weathered it out till 3 a. m., when my rug had got wet through. Close by was the rest-house well. I now transferred my headquarters to it by wading across 2 feet of water for about 15 yards, and then spread a dryish rug on the masonry platform of this well. The well and its platform had both been badly cracked at 5 p. m., and the water had risen to within 18 inches of the surface. It had a thatched covering over it, and this sheltered me during two hours of heavy rain.

At 5 a. m. I rose finally, having had a fair night's rest under most extraordinary circumstances. Having had *chota hazree* at 6, I started to walk back to the ghât, having learnt that the road was impassable towards Lakhipur. As the road was heavy and my *syce* had developed strong fever, I left him the trap to drive in slowly. The whole Trunk Road from Jemadarhat to the ferryghât, which I had seen, had cracks running along it, which were in some instances over 100 feet long; in others the earth had subsided for a similar distance, and then, again, traverse cracks, depressions, etc., existed all along the road, at distances of a few feet for miles; the same thing seemed to have occurred off the road side. The villagers stated that they had lost the grain they had stored in their houses. On arrival at the ghât, it is scarcely necessary to say it was much changed, the river having risen considerably since 4 p. m. However, after getting almost knee-deep in many places in very disagreeable soft sand, about which I was hopping for quite half an hour, I got safe on to the ferry, and returned to Dhubri at 9 a. m. Shortly before reaching the ferryghât, my *syce* had sent word that my horse was drowned, and desired me to return. At the ghât another messenger brought me word saying the animal was well stuck in soft sand. So I sent back coolies, and, much to my surprise, found her none the

worse, and at Dhubri by 5 p.m. It seems she had got into the sand at about 7 a.m., and remained in it till 1 p.m. There were several gaps in the road between Jemadarhat and the ferry-ghât, but none over 2 feet wide, and the *syce*, instead of exercising a little care when having to go off the road, took the shortest cut possible, with the result noted by me. The huge gap I was told of the night before turned out to be a myth.

On returning to Dhubri, everything was as I had pictured it at 5 p.m. the previous night. The town is in ruins. It has sunk everywhere, and for hundreds of feet in a stretch it is cracked and fissured. The dispensary (main building) stands, but has suffered much. It is built on iron pillars, and its brick walls are only about 12 feet high and 2 feet thick; above, its walls are lath and plaster. Hence the reason it has stood. The cutcherry, the forest house, Local Board bungalow, circuit house, the club, telegraph office and telegraph signallers' quarters, and the Gauripur zamindars' house stand, also Leslie's and Maher's, because they are built on piles. Of course, the plaster and lath are all gone. The treasury, Jewett's house, Jolly's house, the dâk bungalow, the Bijni Hall, two large houses at the immigration depôts, the liquor shop in the bazar, and the Muhammadan *musjid* and my house still stand, but are dangerous to enter and must all be dismantled. The post office, Hallifax's, Bogribari zamindar's house, the high school, the church, the Sikh temple, the new jail, the newly-built magazine, the seven newly-built houses in the dispensary ground, and all the out-houses of every single brick-built house are down flat. So far, only one fatal case has been reported, and this a native child about 5 years of age. The natives are all panic-stricken, are living on the roads, in boats, and in steamer flats, and seem most helpless; the better classes encamp out on the roads during the night, although several of their houses are safe. Several of them have, however, suffered considerably; houses, especially those built on new reclaimed land near the Dhubri back water, have subsided a good deal towards the back.

Wild animals used at one time to be numerous, but they are rapidly decreasing in numbers. They include elephants, rhinoceros, bison (*bos gaurus*) buffalo, tigers, leopards, bears, wild pig and five kinds of deer, *viz.*, the barasingha or swamp deer (*cervus duvauceli*), the hog deer (*cervus porcinus*) the rib-faced or barking

Fauna.

deer (*cervulus muntjac*), the sambar (*cervus unicolor*) and the spotted deer (*cervus axis*.)

The rhinoceros is extinct on the south bank and very nearly so on the north. Buffalo are reduced to a few small and scattered herds. The spotted deer are rare and the swamp deer becoming so. On the other hand bison are slowly increasing (owing to the spread of Hinduism), while tigers are common and leopards are plentiful.

Elephants are fairly common on both banks of the Brahmaputra, especially near the hills, and when the crops are ripening the solitary males occasionally do considerable damage. For the purpose of elephant catching the temporarily settled portions of the district are divided into two *mahals* or tracts. The right to hunt in each mahal is sold by auction, and the lessee is required to pay a royalty of Rs 100 on every animal captured. The method usually employed is that known as *mela shikar*. Mahouts mounted on staunch and well trained elephants pursue the herd which generally takes to flight. Three men are usually mounted on each elephant, their only hold being a couple of ropes passing round the animals neck and under its tail. One of the men guides the elephant, the other wields the noose, while the third uses a spiked mallet as a spur. The chase is of a most arduous and exciting character. The great animals go crashing through the thickest jungle and over rough and treacherous ground at a surprising pace, and the hunter is liable to be torn by the beautiful but thorny cane brake, or, were he not very agile, to be swept from his seat by the

boughs of an over hanging tree. After a time, the younger animals begin to flag and lag behind, and it is then that the opportunity of the pursuer comes. Two hunters single out a likely beast, drive their elephants on either side, and deftly throw a noose over its neck. The two ends of the noose are firmly fastened to the *kunkis*, as the hunting elephants are called, and, as they close in on either side of the captured animal, it is unable to escape or to do much injury to its captors, who are generally considerably larger than their victim. The wild elephant is then brought back to camp where it is tied up for a time and gradually tamed. Fifty animals were caught in 1903-04, the last year in which the *mahals* were sold by the Deputy Commissioner.

Bison are generally found near the hills and in the neighbourhood of tree forest; tigers, leopards, and bears are met with in almost every part of the district. Wild animals cause little loss of human life, but, in 1903, are said to have accounted for over 1,300 head of cattle. The number of human beings killed in that year by different animals was as follows:—elephant 2, tigers 5, leopard 1, bears 2, wild buffaloes 2, snakes 32, total 44. Rewards were at the same time paid for the destruction of 57 tigers, 133 leopards, and 7 bears. Small game include wild geese and duck, snipe, florican (*sypheotis bengalensis*), black and marsh partridge, jungle fowl (*gallus ferrugineus*) pheasants, and hares. Peafowl are also occasionally seen in the north of the district.

CHAPTER II.

HISTORY.

Summary—Legendary History—The Koch Kings—Their decline—Invasion of Goalpara by Ahoms—Conquest by the Muhammadans—Relations between British and Ahoms—The Eastern Duars—The Garo frontier—Changes in Jurisdiction—Archæology.

Summary. The Goalpara district has never been a separate political entity under its own king, and its history has to be considered in connection with that of the various states of which, from time to time, it formed a part. It was originally included in the ancient Hindu kingdom of Kamarupa, which is mentioned in the Mahabharata, and which at one time occupied North Eastern Bengal and a great part of what is now known as the Province of Assam. The history of this kingdom, dating, as it presumably does, from about the twelfth century B. C., is largely a matter of doubtful and fragmentary tradition. About the twelfth century A. D., Goalpara is said to have been conquered, first by the Sen, and then by the Pal kings of Bengal, but there are practically no records of the period of their occupation. According to the traditions of the Mahapurushias, it subsequently formed part of a kingdom called Kamata, whose ruler at the beginning of the fourteenth century was named Durlabh Narayan. In the fifteenth century the district was included in the

dominions of the Khyen princes, whose capital Kamatapur, the modern Lal Bazar in the Kuch Bihar State, was sacked by the Muhammadans in 1498 A. D. A few years afterwards it passed into the hands of the Koch kings who also established their capital in Kuch Bihar. About 1580 A. D., the Koch kingdom was divided, and the country east of the Sankosh, which included Goalpara, Kamrup, and Darrang was surrendered to Raghu Rai, the nephew of Nar Narayan; while the territory that lay west of that river was reserved for the son of that prince. Disputes, however, soon broke out between the two families, and Goalpara was conquered by the Muhammadans, who had been called in by Nar Narayan's son to his assistance. The aid of the Ahoms was invoked on the other side, and for some years the war between these two powers dragged on with varying results. In 1637, peace was concluded, and the Barnadi, which now divides Kamrup from Darrang, was fixed as the boundary between Muhammadan and Ahom territory. In 1658, the Ahoms advanced again, occupied Goalpara, and held it for three years, but were compelled to retreat before Mir Jumla's army. From that time onwards the district formed part of the Muhammadan dominions, till, with the rest of Bengal, it was ceded to the British in 1765 A. D.

According to the *Yogini Tantra*, the kingdom of Kamarupa extended from the Karatoya river, on the western boundaries of Rangpur, to the Dikrai, in the east of the Darrang district.* It was divided into four portions,

The
kingdom of
Kamarupa.
1200 B.C.
1000 A. D.

* The principal authority for the history of Kamarupa, and the Khyen and Koch Kings is an interesting paper on the Koch Kings of Kamarupa by Mr. E. A. Gait, C. S., published in J. A. S. B., Vol LXII, Part I, No. 4, 1893.

i. e., Kamapith, from the Karatoya to the Sankosh, Ratnapith from the Sankosh to the Rupahi, which included therefore the present district of Goalpara; Suvarnapith from the Rupahi to the Bhareli; and Saumarpith from the Bhareli to the Dikrai. The earliest king of Kamarupa, of whom anything in particular is recorded, is Narak, who is said to have been the son of the earth by Vishnu, and who defeated and slew his predecessor Ghatak. He established his capital at Pragjyotishpura, the modern Gauhati, and seems to have been a powerful and prosperous, though some what headstrong, prince.

He was succeeded by his son Bhagadatta, who is mentioned in the Mahabharata as fighting on the side of the Kauravas, at the great battle of Kurukshetra; and we thus seem justified in assuming that fully a thousand years before Christ, Goalpara formed part of a powerful kingdom ruled by a line of non-Aryan princes.

Practically nothing is known of the history of the district for the next 2,000 years. The dynasty of Narak was displaced by foreign invaders, and after many generations was restored again. A line of powerful and civilized Pala Kings flourished in Central Assam about the tenth and eleventh centuries A. D., but whether Goalpara was included in their territories or not it would be difficult to say. At the begining of the fifteenth century we reach more certain ground.

The Khyen
Kings 15th
century A. D.

A Khyen of humble origin, who is said to have been the cowherd of a Brahman, succeeded in deposing the local king and founded a capital at Kamatapur in the

south of the Kuch Bihar State, near the modern village of Lal Bazar. The ruins of this city still exist and, when visited by Buchanan Hamilton in 1809 A. D., were said to be nineteen miles in circumference.

This Khyen assumed the name of Niladwaj, and was succeeded by his son Chakradwaj, who in his turn handed on the sceptre to his son Nilambar. Nilambar was a powerful prince and is said to have reigned over Rangpur, Goalpara, and part of Kamrup, but in 1498 A. D., his capital was taken by the Muhammadans under Husain Shah. The Muhammadans are said to have been invited into the country by Nilambar's minister, who disclosed to them its intrinsic weakness. This man had been embittered by the savage conduct of his royal master. The Raja suspected the minister's son of tampering with one of the queens, and had the young man killed, and his flesh served up to his father at a banquet. After the poor wretch had eaten freely of the dish, its horrid nature was disclosed to him. The minister then left the capital, ostensibly to do penance for the dreadful act he had unwittingly committed, but in reality to seek the means of vengeance.

The siege of Kamatapur is said to have lasted several years, and the town was finally taken by stratagem. The Muhammadan general announced that he was about to retire, but asked that, before he did so, his wife might be allowed to visit Nilambar's queen. The request was granted, and a number of closely veiled litters were introduced within the city walls. But it was soldiers and not women that the litter curtains hid, and

the gates were quickly thrown open to the advancing Moslems. Nilambar was placed in an iron cage to be taken to Gaur, but on the way he succeeded in making his escape; and Buchanan Hamilton reports that even in his time the common people of Kamarupa still looked for his restoration at some future date.

After the fall of Kamatapur the Muhammadans endeavoured to extend their conquests up the valley of the Brahmaputra, but they were repulsed by the Ahoms, and Nilambar's former kingdom was split up into a number of petty principalities.

The
Koch Kings.
Viswa Singh
1509-1534
A. D.

In the midst of this confusion and anarchy a new family rose to power. The founder of the line was a Mech named Viswa Singh, who, according to tradition, was the son of Hira, the wife of one Haria Mandal, by Siva, who assumed the shape of her husband, and thus induced her to admit him to her embraces. Viswa Singh subdued the petty princes who surrounded him, founded a magnificent city in Kuch Bihar, and reduced his state to order. The whole population was divided up into different corps under officers of increasing dignity; a thakuria being appointed over every 20 coolies, a saikia over every 100, a hazari over 1,000, an umra over 3,000 and a nawab over 66,000. He took a census of his subjects and found that the number capable of bearing arms was 5,225,000, an obvious exaggeration. He is said to have marched against the Ahoms, but to have abandoned the expedition owing to the collapse of his commissariat; but the Ahom version, which states that he was defeated and made tributary,

seems a more probable explanation of the failure of the expedition.

Viswa Singh died after a reign of 25 years, and was succeeded in 1534 A. D., by his son Malla Deva, who assumed the name of Nar Narayan. The reign of this prince represents the zenith of the Koch power, and his armies, which were led by his brother Sukladwaj or Silarai, met with almost unvarying success. He first attacked the Ahoms, but mindful of his father's failure, commenced operations by building a great military road along the north bank of the Brahmaputra, and constructing tanks at regular intervals along it. The work was entrusted to his brother Gohain Kamala, and the road, much of which is still in existence, bears the name of Gohain Kamala Ali to the present day. Nar Narayan entered the Ahom capital Gargaon, (the modern Nazira) and did not leave till he had received the submission of the Ahom king. The Rajas of Cachar and Manipur were then reduced to the state of feudatary chiefs, and the kings of Jaintia, Tippera, and Sylhet conquered and slain. Further successes were obtained over the rulers of Khairam and Dimuria, but the tide of fortune turned when an attack was made on the kingdom of Gaur. The Koch army was routed and Silarai himself made prisoner. Nar Narayan declined, however, to accept this defeat as final, and a few years later joined with the Emperor Akbar in a second attack upon the Pasha of Gaur. This enterprise was crowned with success, and Gaur was divided between the Emperor of Delhi and the Koch king.

Nar Narayan
1534-1584
A.D.

**Decline of
Koch king-
dom Raghu
Rai 1581-1593.**

Within the space of two generations, the Koch kingdom had attained to an extraordinary height of power and prosperity, but its decline was as rapid as its rise. For a long time Nar Narayan had no male offspring, and Silarai's son, Raghu Rai, was regarded as his heir. When this boy was approaching manhood, one of his uncle's wives gave birth to a son called Lakshmi Narayan; and Raghu Rai, realising that he had now no hope of succeeding to the throne, withdrew from the capital to Barnagar in the Barpeta subdivision of Kamrup. Nar Narayan endeavoured to compel him to return, but his soldiers were defeated and the king weakly resolved to divide his kingdom.* The territory east of the Sankosh was made over to Raghu Rai, while Lakshmi Narayan received the part that lay west of that river. Raghu Rai continued to reside at Barnagar, and seems to have been much devoted to religious exercises.

**Parikshit
1593-1614.**

He was succeeded by his son Parikshit in 1593 A. D., who built a town at North Gauhati, and mounted cannon at Pandunath. War then broke out between Parikshit and his cousin Lakshmi Narayan.† The latter was defeated but called in the Muhammadans to his aid, and on their arrival the situation was reversed.

* According to Buchanan Hamilton, the kingdom was founded by Hajo, father of Hira, and grandfather of Viswa Singh, and divided by Viswa Singh who allotted the portion east of the Sankosh to Sukladwaj or Silarai, and that west of the river to Nar Narayan. On general grounds, however, this account seems to be less probable than that given in the body of the text.

† According to one authority, the quarrel dated from the time of Raghu Rai who declined to pay tribute after Nar Narayan's death.

Mukarram Khan advanced with 6,000 horse, 12,000 foot, and 500 ships, and took Parikshit's fort at Dhubri. The Koch king then essayed a naval engagement on the Gadadhar river, but was defeated and retreated to Barnagar near Barpeta where he surrendered in 1614 A. D., and was sent to the Court of the Mughal Emperor.*

His brother Bali Narayan, or Baldeo as he is called by the Muhammadan historians, fled to the Ahoms, and the struggle between these two powers continued for some years with varying success. The Musalmans penetrated as far as Bishnath, but their career of conquest was then checked by a crushing defeat. They retained, however, their hold upon Goalpara, and, in the hostilities that subsequently took place, much of the fighting seems to have been in the neighbourhood of Gauhati, near Pandughat. Parikshit's son, Chandra Narayan, who had established himself with a strong force at Karaibari was defeated and killed; and Bali Narayan, who had erected a fort at Jogighopa on the eastern frontier of the Goalpara district, was driven across the Manas. The following year he was completely routed and he shortly afterwards died at Singri in Darrang (1637 A. D.) The Muhammadans took the forts at Pandu and Srighat, and the Barnadi, which divides the modern districts of Kamrup and Darrang, was made the boundary between Muhammadan and Ahom territory.

**Bali
Narayan.
1614-1637.**

* An account of this struggle will be found in a paper by Professor Blochmann in J. A. S. B., Vol. XLI, Part I, No. 1, 1872, page 49.

**Ahoms seize
Goalpara in
1658. A. D.**

Twenty years later, Pran Narayan, who was at that time ruler of that part of the Koch kingdom which lay west of the Sankosh, took advantage of the confusion that occurred on the deposition of Shah Jahan to attack the Muhammadan governor of Goalpara. This officer retreated to Gauhati, but was expelled by the Ahoms, who then advanced down the valley of the Brahmaputra, seized Goalpara, and drove Pran Narayan with his army beyond the Sankosh.

**Reconquered
by Muham-
madans in
1661.**

For three years Goalpara remained in the hands of the Ahoms, but in 1661 A. D. Mir Jumla started on the invasion of Assam. He defeated Pran Narayan, and marched up the south bank of the Brahmaputra till he occupied Gargaon (Nazira). The rains then set in with unusual severity, supplies were very scarce, and the camp of the invaders was ravaged by disease. Early in the cold weather, a treaty was patched up and Mir Jumla retreated to Bengal, though he died on the river before reaching Dacca. Two years later the Ahoms were again in possession of Kamrup, but the advanced guard of the Mughals remained at Rangamati on the banks of the Manas; and Goalpara continued under Muhammadan rule till 1765, when, with the rest of Bengal, it passed into the possession of the East India Company.

**Relations
between
British and
Ahoms.**

Prior to 1825, the year in which the Burmese were expelled from the Brahmaputra valley, Goalpara town and Jogighopa, a village lying opposite to it on the north bank of the Brahmaputra, were the frontier outposts from which trade was carried on with the Assamese. Colonies of Europeans settled here, who forcibly seized a

monopoly of the export trade of Bengal. A similar monopoly of the Assam trade was enjoyed by two Brahmans, who held a farm of the Ahom custom house, and business was carried on between these two communities to their mutual profit. The principal articles of export from Assam were lac, silk, cotton, and mustard seed, the chief import salt. After Captain Welsh's expedition in 1792, these monopolies were abolished, but the times were not ripe for free trade. According to Buchanan Hamilton, the immediate result was a great decrease in the volume of business done, as little reliance could be placed on the good faith of the individual merchants. The remains of this European colony are still to be seen in the shape of four nameless tombs at Jogighopa, which is now but a tiny village. It was from Goalpara, too, that the first attempt was made by a British subject to intervene in the affairs of Assam. In 1788, a salt farmer of that place, named Raush, sent a body of barkandazes to assist the Ahom Raja, who had been driven from his throne by the rebel Moamaras. The barkandazes were, however, cut up to a man, and the Raja was compelled to apply to the Governor-General for aid. The expedition of Captain Welsh in 1792 and the subsequent conquest of Assam in 1825, form, however, no part of the history of Goalpara.

The history of the Eastern Duars, a strip of country lying at the foot of the Bhutan Hills, differs in some respects from that of the remainder of the district. According to the Vamsavali, a chronicle in the possession of the Darrang branch of the Koch family, which

**The Eastern
Duars.**

was compiled about 1806 A. D., Nara Singha, son of Viswa Singh, and brother of Nar Narayan, became ruler of Bhutan.* In this there is nothing intrinsically improbable. Mr. Ashley Eden, in his Report on his mission to Bhutan, states that the Bhutias have apparently not been in possession of Bhutan for more than two centuries; and that it formerly belonged to a tribe called by the Bhutias Tephu, who are generally believed to have been natives of Kuch Bihar. These Tephus were subsequently driven down into the plains by some Tibetan soldiers, who had been sent from Lhasa to enquire into the resource of the country.† On the break up of the Koch power at the beginning of the seventeenth century, and during the struggles that ensued between the Muhammadans and Ahoms, the Bhutias succeeded in bringing the territory now known as the Eastern Duars under their control. Their system of administration seems to have been harsh and arbitrary. Mr. Mills, in his report on the Goalpara district in 1853, states that raiyats were constantly moving from the Eastern Duars into British territory to escape the exactions and oppressions of the Bhutia Zamindars.‡ The hill-men did not, however, confine their attentions to their own people, and repeated outrages and aggressions were committed on the property and persons of our subjects. Notwithstanding numerous remonstrances and threats, scarcely a year passed without the occurrence

* Vide the Koch Kings of Kamarupa by Mr. E. A. Gait, C. S., page 24.

† Political mission to Bhutan, p. 108.

‡ Report on the Province of Assam by A. J. Moffatt Mills, Calcutta, 1854 Goalpara, p. 2.

of several raids into British territory, in which the villagers were plundered and killed, or carried off as slaves. In the cold weather of 1863, Mr. Ashley Eden was sent on a mission to Bhutan to remonstrate with the Government of that state. But instead of meeting with apologies and promises of amendment, the envoy was subjected to the grossest insults. On his return to British territory, the Bhutan Rajas were informed that, unless the fullest reparation was afforded, Government would be compelled to make good their demands by force. This solemn warning was completely disregarded, and in 1864, Government formally annexed the Bhutan Duars and occupied them with a military force. The Bhutias offered but a feeble resistance, and a treaty of peace was concluded in November 1865 under which Government undertook to make a yearly payment of Rs. 25,000 rising to Rs. 50,000 as a species of quit rent for the Duars, on condition that the hill men continued to be of good behaviour.

It was not, however, only on the northern frontier that the tribes inhabiting the hills molested the inhabitants of the plains. The mountains to the south were occupied by the Garos, a section of the great Bodo race, who were probably driven southwards from the plains by the kings of Kuch Bihar.

**The Garo
frontier.**

The earliest notices of the Garos describe them as being in a state of intermittent conflict with the zamindars of the large estates lying at the foot of the hills. The exactions levied by the subordinates of these persons irritated the hill-men, and the belief that

the spirits of their headmen required the souls of others to attend them in the next world, acted as a further incitement to the despatch of raiding parties. At the end of the eighteenth century, the Garos inhabiting the outer ranges had been brought to some extent under the authority of the zamindars, but the villages in the interior were entirely independent. Steps were then taken by Government to release the tributary Garos from the control of the Bengali landlords, and it was hoped that by this means the practice of raiding would be stopped. It was difficult, however, to put down all oppression, and the hill men continued to be turbulent. In 1848, an expedition was sent into the hills to punish the Dasanni Garos for having murdered one of their headmen, with all his family, because he attempted to collect the tribute due by them to government. In 1852, seven Garo raids took place in which 44 persons were killed. A blockade was established along the frontier, which produced some effect, but, in 1856, the tribes broke out again and a succession of forays was made upon the plains. Between May 1857 and October 1859, nine raids were made into Goalpara, and 20 heads taken. An expedition was despatched into the hills in 1861, the effects of which lasted for a few years; but, in 1866, a most murderous raid was committed on the Mymensingh district, and it was decided to establish a British officer in the hills. The success with which this experiment was attended was very striking. Raids at once ceased, and since that date the southern frontier of the district has been undisturbed. A full account of the Garo troubles will

be found in the North-East Frontier of Bengal by Mr. (afterwards Sir) Alexander Mackenzie, pages (245-261.)

Goalpara has experienced several changes of jurisdiction since first it came under British rule. ^{Changes in jurisdiction.} The permanently settled portion was originally part of the district of Rangpur. In 1822, it was formed into a separate district known as North-East Rangpur, which, together with the Garo Hills frontier, was placed in charge of Mr. David Scott, one of the first and the greatest of our administrators on the north-east frontier. After the cession of Assam in 1826, Goalpara was annexed to the Assam Valley division, but in 1867 was transferred to the newly created Kuch Bihar Commissionership. In the following year it was placed for judicial purposes under the Judicial Commissioner of Assam; and it was finally incorporated in the new Province, when Assam was erected into a separate administration in 1874. The headquarters of the district were originally fixed at Goalpara, but were transferred to Dhubri in 1879. It was at that time thought that the railway would soon be extended to the town, an event which did not take place till more than twenty years later, and it was considered to be the most convenient centre for the supervision of the overland route of immigration to the Province. Other arguments put forward were the facilities afforded for forest and land revenue administration, and the fact that Dhubri was a growing place and Goalpara a decaying one. Most of these arguments have been hardly justified by subsequent events.

Owing to the erosive action of the river, the growth of Dhubri has received a serious check, and it is still a much smaller town than Goalpara.

Archæology. In the previous pages, it has been shown that Goalpara, though forming a portion of several powerful kingdoms, has generally been an outlying or frontier district, and has never contained the capital of the king to whom it owned allegiance. The result is that there are hardly any archæological remains of interest within its boundaries. At Rangamati, about six miles north-east of Gauripur town, there is a mosque which is said to have been built in 1687 A.D. Other remains which are situated on the hill are a masonry enclosure, in which a tiger is said to have been confined, and an *idgarh*, or place of prayer, with a deep well. The hill is now covered with thick jungle, but in the time of the Mughals it was the headquarters of the Imperial *faujdar*. Near Krishnai, there was a temple to Tukreswari which enjoyed some local repute. It was wrecked by the earthquake of 1897, and is now (1905) under reconstruction. Near North Salmara, there are the remains of extensive earthworks, about one mile in circumference, which are known as Ram Raja's garh. At Jogighopa, there are small caves in the rocky cliffs overhanging the Brahmaputra, which are said to have been sanctified by the various ascetics who from time to time have lived there. The hillock at Dhubri is said to have been artificially constructed in 1665 A. D., by the Mughal army, under the orders of Guru Tez Bahadur, the famous Sikh.

CHAPTER III.

THE PEOPLE.

Area and Density—Towns and Villages—Growth of Population—Migration—Sex and Marriage—Infirmities—Language—Caste and Tribe—Religion—Hindu Sects—Temples and Dhams—Animism—Muhammadanism—Christianity—Other religions—Occupations.

The total area of the district is 3,954 square miles, the population in 1901 was 462,052, and the density was thus 117 to the square mile. Area and density.

The district contains two small towns, Dhubri and Goalpara, and 1,461 villages. Towns and villages. The villages are not, however, well defined units, clusters of huts which stand out clearly in the centre of the fields tilled by their inhabitants. Rice, the staple crop, is grown in wide plains, dotted over with clumps of bamboos and fruit trees in which are buried the houses of the cultivators. It is groves and not villages that the traveller sees when riding through the more densely populated portions of the district, and not a house can usually be discerned till he has penetrated this jungle of plantains, betel nut trees, and bamboos. There is generally no dearth of building sites, there are no communal lands, and there is nothing to keep the population together. Except in the Eastern Duars,

it is difficult to tell where one village ends and another begins, or to which of the larger clumps of trees should be assigned the smaller clumps which are freely dotted about amongst the rice fields. The result is that the statistics of villages are of little practical importance. Taking them, however, for what they are worth, it appears that villages as a rule run small, and in 1901 nearly half the total population were living in hamlets with less than 500 inhabitants.

**Growth of
population.**

The earliest estimate of the population on record is one submitted in 1853 to Mr. Moffatt Mills by the Deputy Collector in charge of the *thakbast* survey. The Eastern Duars at that time formed part of Bhutan, and the population of the remainder of the district was said to be 141,638 souls. The first regular census was taken in 1872, and the figures in the margin show that the earlier estimate was probably too low. It is true that the Eastern Duars had been added in 1864, but the population of this tract in 1901 was only 72,072. The census of 1872 was admittedly incomplete, and the growth of the population can only be measured with any degree of accuracy from 1881. The total increase during the next twenty years only amounted to 3 per cent.

1872	387,841
1881	448,700
1891	452,773
1901	462,062

The best test of natural growth is, however, to be found in the tables of birth place. From these it appears that the number of persons born in Goalpara and censused in the Province in 1901, was some 12,000 more than the number so returned in 1891, but a few hundreds less than the figure for 1881. This complete

absence of natural growth is largely due to the ravages of *kala azar*, to which reference will be made in a subsequent chapter, but even apart from the effects of this dread disease, there seems to be something in the district unfavourable to a rapid expansion of the population. This was the view taken by Mr. Moffatt Mills in 1853. "Mr. Bedford, however, informs me, that notwithstanding this influx of settlers, he does not think the population is on the increase, in consequence of the great mortality annually caused by cholera and small pox. He says, mangoe topes, sooparie trees, and hamlets are to be seen deserted in some parts, the inhabitants having been carried off by these scourges, while in other parts land is being reclaimed and new villages are springing up."* It is impossible at present to draw any definite conclusions as since 1881, the first year for which reliable figures are available, a special cause of high mortality, in the shape of *kala azar*, has been in operation in Lower and Central Assam. It is, however, significant that the population of Kuch Bihar, which adjoins Goalpara on the west, decreased by nearly 4 per cent. between 1881 and 1891, and by 2 per cent. in the next decade. In Rangpur too, another neighbouring district, there was no growth of population between 1872 and 1901, and, though of recent years the public health has been improving, the natural growth during the last decade was only about 1 per cent. The Terai at the foot of the Bhutan and Garo Hills is un-

* Report on the Province of Assam, by A. J. Moffatt Mills. Calcutta 1854. Goalpara, p. 2.

doubtedly unhealthy. Infant marriage too, which is extremely prevalent in Goalpara, is certainly not a factor which conduces to a rapid growth of population.

**Variation by
subdivisions**

From Table IV in the Appendix it will be seen that while the population of the Dhubri subdivision increased by 47,000 during the last twenty years of the century, the population of Goalpara declined by 31,000. It would not, however, be safe to infer that Goalpara alone is unhealthy, while Dhubri is flourishing and progressive. *Kala azar* is said to have been most virulent at the foot of the Garo Hills, and that may have had something to do with the decrease in the Goalpara subdivision. Migration is, however, another important factor, and most of the emigration from the district is believed to go from the southern while most of the immigration is to the northern subdivision. There is probably also migration from Goalpara to Dhubri to which the census figures give no clue.

Migration.

The tea industry, which is the principal cause of immigration to other districts of Assam, is of no importance in Goalpara; but, situated as it is on the confines of the Province, it receives a considerable number of foreigners, and 9 per cent. of the population censused there in 1901 had been born outside Assam. The immigrants from Bengal numbered 33,803 or about six sevenths of the total. Nearly half of these Bengalis came from the neighbouring district of Rangpur, and almost all these natives of Rangpur were censused in the Dhubri subdivision. The number of emigrants to Bengal is, on the other hand, comparatively small. In

1901, only 5,412 persons born in Assam, the great bulk of whom came no doubt from Goalpara, were censused in Rangpur, Jalpaiguri, and Kuch Bihar. The other Provinces and States from which there were a considerable number of immigrants were the United Provinces, Rajputana, and Nepal.

In 1901, there was a net loss to Goalpara of 7,293 persons from inter-district migration within the Province. A considerable number of people cross the border into the plains portion of the Garo Hills. Against this must be set the northward movement from the hills, but the net loss to Goalpara was nearly 6,000 souls. On the other hand, in its transactions with Kamrup, the district gained about 2,500 persons, the earthquake having seriously interfered with cultivation in the neighbourhood of Barpeta. In 1901, there were less than 4,500 natives of Goalpara who had emigrated to districts in the Province other than these two. Nearly 1,500 of these persons were censused on the tea gardens.

The proportion of women to men is lower in Goalpara than in any other district of the Province, with the exception of Sibsagar and Lakhimpur. The proportion has moreover a steady tendency to decrease.* Sex and marriage. The deficiency of women is partly due to immigration, men amongst the immigrant population largely exceeding the women in numbers. It is also partly due to a deficiency of women amongst the natives of the district. This deficiency is almost entirely due to the Hindus and Muhammadans, as amongst the animistic tribes, who

* Number of women to 1,000 men :—1881, 947 ; 1891, 911 ; 1901, 903.

form more than one-fourth of the total population, the women slightly exceed the men in numbers. It is a significant fact that in Goalpara the followers of both of these religions marry their girls at a much earlier age than is usually the custom in Assam. There can be little doubt that this custom is prejudicial to female life, and in the Report on the Census of India for 1901 it is shewn that the proportion of girls at the age of 10-15 varies inversely with the number who are married at this period.* How marked is the difference between the customs of Goalpara and Assam Proper † with regard to the age of marriage, will be seen from the following abstract, which shows the percentage of Hindu girls at certain ages; who have performed the marriage ceremony, out of the total number living at that age.

Age.	Percentage of girls married and widowed.				
	Goalpara.		Assam Proper		
0-10	...	4·8	...	...	0·8
10-15	...	62·4	...	...	15·1
			Unmarried.		
15-20	...	7·2	...	...	38·7

In Assam Proper, it is quite the exception for marriage to take place before the age of puberty, but in this respect Goalpara unfortunately conforms to the customs of Bengal. The figures quoted refer only to Hindus, but the Muhammadans of the district are, if anything, still more addicted to the practice. Even the animistic tribes marry earlier than is usual in Assam.

* P 118.

† Assam Proper consists of the five upper districts of the Assam Valley, *i.e.*, Kamrup, Darrang, Nowgong, Sibsagar and Lakhimpur.

The usual form of marriage amongst Hindus is the full *hompura* rite, which is described on page 63 of the Report on the Assam Census of 1901. The practice of taking a bride price is almost universal, even Brahmans receiving money for their daughters. The price asked for the girl depends to a great extent on the resources of the purchaser, and varies from Rs. 20 to Rs. 1,000. The average price is probably about Rs. 100. A man who is too poor to pay cash for a girl works for some time in the houses of his father-in-law as a *ghorojia*. Amongst the animistic tribes the essential portion of the ceremony is a feast of pork and rice washed down with great quantities of rice beer. The cost of such a wedding breakfast is about Rs. 50.

The abstract in the margin shows out of 10,000 males **Infirmities.**

	Goalpara	Assam	Indian Empire.	the number afflicted with the four special infirmities selected for
Insanity ...	8	5	3	
Deaf mutism ...	11	9	6	
Blindness ...	13	10	12	
Leprosy ...	21	13	5	

record at the Census of 1901.

The district enjoys an extraordinary pre-eminence with regard to three out of four of these infirmities. The proportion of insane, blind, and leprous persons of both sexes in Goalpara, at each of the last three enumerations, was not exceeded by any other district in the plains of the Province, with the solitary exception of blind men in 1891, and even they stood a good second on the list. The proportion of deaf-mutes never fell below the average for the plains; but this, in view of the other

extraordinary record, might almost be considered a matter for congratulation. It has been suggested that the prevalence of insanity may be due to a special predisposition of the Koch race to that form of disease. This theory derives some confirmation from the fact that the proportion of insane persons is exceptionally high in Kuch Bihar and the neighbouring district of Rangpur. With regard to leprosy, Goalpara enjoys a position not only of Provincial but even of Imperial eminence. In 1901, there were only three districts in the whole of the Indian Empire, with a larger proportion of male lepers. The causes which tend to increase or diminish the prevalence of this disease are still unknown.

Language.

Bengali is the common language of the district, and was returned by 69 per cent. of the population in 1901. Assamese was spoken by less than three per cent. In both cases the form of dialect in use is far from pure. The tribesmen are, however, unusually faithful to their own peculiar forms of speech, and nearly a fourth of the total population use Kachari, Rabha, or Garo, all of which are closely akin. Many of the villagers in the Eastern Duars can understand no language other than their own. In the other districts of the Assam Valley the Tibeto-Burman tribes are generally bilingual, and know enough of Assamese to enable them to carry on a conversation with their Hindu neighbours. This is not the case in Goalpara, and in the Eastern Duars intercourse with the villagers is much restricted for any one who does not happen to have studied Mech.

Homogeneity is the dominant note in the social system of Goalpara, and a single caste, the Rajbansi, form over one fourth of the total population. The ranks of the Rajbansi are recruited from the aboriginal tribes such as the Mech, Rabha, and Kachari, and if they with the Koch, who are also akin, are added, this single group amounts to more than half the total population of the district. More than one fourth of the total population are Muhammadans, and less than a quarter of the whole is thus left for all castes and tribes outside the Rajbansi group. The higher castes, such as the Brahman and Kayastha, are by no means strongly represented. Even the Kalitas, who stand for middle class respectability in Assam and form so large a proportion of the population of Kamrup, are comparatively few in numbers. The same may be said of the Kewats or Kaibarttas, who rank next after the Kalitas in the estimation of the Assamese. Goalpara never, however, formed part of the Ahom kingdom, and, though it is one of the districts of the Assam Valley, it belongs more to Northern Bengal than to Assam Proper. Brief notes are given in the following pages on the indigenous castes and tribes who had more than 5,000 members in the district in 1901.*

The Brahmans perform the offices usually allotted to them in Bengal, and act as priests, and officers, ministerial or otherwise, of Government and the great land-

Males	...	...	2,308.
Females	...	...	898

*An alphabetical glossary of all castes censused in Assam will be found in Chap. XI of the Census Report for 1901.

lords. Most of these men are foreigners, a fact which is clearly brought out by the disproportion between the sexes, there being nearly three males to every female. The Brahmans of Goalpara fall into four classes, Vaidik, Rarhi, Barendra, and Kamrupi. The Vaidik Brahmans are descended from men of that caste who migrated from Upper India to Bengal about the eleventh century A. D., but the Rarhi and Barendra septs have moved into the district in more recent times. Many of the Kamrupi Brahmans are priests who minister to castes comparatively low in the social scale. They also infringe the traditions of their caste by taking money for their daughters, a practice condemned by the orthodox.

Garos.

The Garos are a tribe of Bodo origin, the bulk of whom are to be found in the hills that bear their name.

Males	...	5,438
Females	...	5,401

According to their own traditions they came originally from Tibet and settled in Kuch Bihar. From there they were driven to Jogighopa, and thence to Gauhati, where they were enslaved by the Assamese. They were, however, delivered by a Khasi prince, and then travelled *vid* Boko to the Garo Hills. Most of the Garos are to be found in the hilly country on the outskirts of the Garo Hills. They live in better style than many of the hill tribes and are to some extent differentiated from other members of the Bodo family by the good position accorded to their women and the extraordinary scantiness of the national costume. A full account of the manners and customs of the Garos will be found in a Monograph on the Garo tribe which is now under preparation.

The Jugis are a low caste whose traditional occupation is weaving, and who are looked down upon by their superiors in the social scale. Like other humble castes they lay claim to a high origin. According to one account they are the offspring of Brahman widows and ascetics, while others assert that they are descended from Gorakshanath, who was an incarnation, of Siva. The Jugis in Goalpara support their pretensions by laying claim to ceremonial purity. They are taking to infant marriage, and some even go so far as to assume the sacred thread. Very few Jugis now earn their living as weavers, and the caste as a whole has taken to agriculture as a means of livelihood.

In Goalpara, they form a comparatively advanced section of the community and declare that the period of depression through which the caste has passed was entirely due to the malevolence of Ballal Sen.

The Kacharis or Bara (mispronounced Bodo), as they call themselves, belong to the great Bodo tribe, which is found, not only in the Brahmaputra Valley, but in the Garo Hills and in Hill Tippera, south of the Surma Valley. It is generally supposed that they are a section of the Indo-Chinese race, whose original habitat was somewhere between the upper water of the Yang-tse-kiang and the Hoang-ho, and that they gradually spread in successive waves of immigration over the greater part of what is now the Province of Assam. This theory has much to recommend it and is to some extent confirmed

Males	...	...	6,904
Females	...	...	6,900

Males	...	...	7,342
Females	...	...	7,325

by a prayer which is in use amongst the Dimasa* in the North Cachar Hills. This prayer refers to a huge peepul tree growing near the confluence of the Dilao (Brahmaputra) and the Sagi. There the Kacharis were born and increased greatly in numbers, and thence they travelled by land and water till they reached Nilachal, the hill on which the temple of Kamakhya stands, in Kamrup. From Gauhati they migrated to Halali, and finally settled in Dimapur. The inscriptions recorded on copper plates in the tenth and eleventh centuries A. D., refer to the conquest of Kamarupa by a foreign dynasty which was subsequently replaced by a king of the line of Narak†. It is possible that the Kacharis were the invading force, and on their expulsion from Gauhati they might not unnaturally have retreated towards the Dhansiri valley.

No connection between Kacharis of Goalpara and Dimapur.

The Kachari kingdom was one of the strongest powers with which the Ahoms were confronted when they entered the valley of the Brahmaputra. Their capital was located at Dimapur on the Dhansiri river, and at one time they were in possession of the western part of Sibsagar, and the greater part of the Nowgong district. Dimapur was sacked by the Ahoms in 1536, and the Kachari king was compelled to move his capital to Maibang. Subsequently they migrated to the plains of Cachar, and the last representative of the line was assassinated there in 1830. It seems, however, doubtful whether the Kacharis who live on the north bank of

* The Dimasas are the section of the Kacharis who live in the Cachar district.

† Vide J. A. S. B., Vol. LXVII, Part 1, No. 1, 1898, page 99.

the Brahmaputra were ever in any way connected with the king of Dimapur. The one tribe style themselves Bara, the other Dimasa, and, though both use languages of Bodo origin, the difference between plains Kachari and Dimasa is greater than that between French and Spanish. The two tribes sprang, no doubt, from the same stock, but there is no evidence to show that they were ever united by the tie of a common nationality, or that the Kacharis of Goalpara were more closely connected with the Kacharis of North Cachar, than are the Rabhas and Lalungs.

The following legend is prevalent amongst the Dimasa. It would account for the separation of the Bodo and Dimasa, but no traces of the story have been found amongst the Kacharis of Goalpara.

**Dimasa
legend of the
separation
of the two
tribes.**

"Long ago the Dimasa fought against a powerful tribe and were beaten in a pitched battle. They were compelled to give ground, but after a time further retreat was barred by a wide and deep river. In despair the king resolved to fight again on the following day: but in the night a god appeared to him and told him that the next morning the army could cross the river if they entered it at a spot where they saw a heron standing on the bank. No one, however, was to look back while the movement was in progress. The dream proved true. A heron was seen standing on the bank, and the king and a great portion of his people crossed in safety. A man then turned to see whether his son was following, when the waters suddenly rose and swept away those who were in the river bed and prevented the others from crossing. The Dimasa were those who succeeded in reaching the further bank in safety."

The ordinary Kachari of the north bank is an illiterate villager who has only vaguely heard of the Kacharis of Nowgong, but knows that their language differs slightly from his own. He is quite innocent of history, has

never heard of the Kachari raj, and as a source of information of anything prior to the immediate present is absolutely useless. A full account of the manners and customs of the Kacharis will be found in the Gazetteer of the Kamrup district.

Kalita.

The following account of the Kalitas is taken from the Census Report of 1901 :—

“ There is much uncertainty as to the origin of this caste. The
 Males ... 6,198 popular explanation is that Kali-
 Females ... 4,856 tas are Kshatriyas, who, fleeing
 from the wrath of Parasu Ram, concealed their caste and their
 persons in the jungles of Assam, and were thus called Kullupta.
 Other theories are that they are Kayasthas degraded for having
 taken to cultivation, an explanation which in itself seems some-
 what improbable, and is not supported, as far as I am aware,
 by any evidence, or that they are the old priestly caste of the
 Bodo tribe. The latter theory can hardly be said to account for
 their origin, and though it is possible that Kalitas may have
 originally acted as priests this fact throws little or no light on
 the problem of what the Kalitas are. The most plausible sugges-
 tion is that they are the remains of an Aryan colony, who settled
 in Assam at a time when the functional castes were still unknown
 in Bengal, and that the word ‘ Kalita ’ was originally applied to
 all Aryans who were not Brahmans. The Kalitas are divided
 into two main subdivisions, Bar and Saru, and into a number of
 professional sub-castes. In Upper Assam, Bar Kalitas are said
 to decline to use the plough, though they occasionally work with
 the spade, but there is no such restriction in Kamrup, where the
 great bulk of the caste is found. Cultivation is, in fact, the
 traditional occupation of the caste, and they even consent to work
 as coolies on tea gardens. The usual procedure for a Kalita who
 has succeeded in rising above the necessity for manual labour,
 and is no longer compelled to follow the plough, is to call himself
 a Kaist or Kayastha. Two explanations are given of the origin
 of the Saru Kalita—one that he is the offspring of persons who
 for three generations back have not been united by the ‘ hom ’
 ceremony, the other that he is the child of a Bar Kalita and
 a Kewat woman. Whether the Bar Kalita can intermarry with,
 and eat *kachchi* with the Saru Kalita seems open to question, and
 the practice apparently varies in different districts ; but there

seems to be no doubt that the functional subdivisions of the caste are debarred from the privilege of close intercourse with the Bar Kalita. These subdivisions are the Mali, Sonari, Kamar, Kumhar, Napit, Nat, Suri and Dhoba. The first two inter-marry with the Saru Kalita and also with the Kamar Kalita. The last four groups are endogamous. All these functional groups are to some extent looked down upon, probably because followers of these professions, who were not true Kalitas, have occasionally succeeded in obtaining admission within their ranks; but the goldsmiths, from their wealth, have secured a good position in society. Kalitas have a good Brahman for their priest, and their water is taken by every caste, a fact which no doubt explains the high value attached to Kalita slaves in the time of the Assam Rajas, when two Koches could be purchased for the price of a single Kalita, though the Koch is generally the hardier and stronger man of the two."

Early marriage is common in Goalpara, but not in Assam Proper, except amongst the upper sections of the caste. They take, in fact, a liberal view of the relations between the sexes, and co-habitation is the essential part of marriage. Well-to-do Kalitas are invariably united by the *hompura* rite and employ a Brahman, but the poorer people often content themselves with the *agchauldia* or *juron* ceremonies, which consist of a feast to the villagers and a public acknowledgment of the position of the bride. Some authorities hold that this, though a valid form of marriage for the lower Assamese castes, is not sufficient for the Kalita. They regard the *hompura* rite as the one essential ceremony of purification, but it can be performed after co-habitation has begun, and sometimes takes place after the death of the husband. An unmarried girl, who becomes pregnant, does not forfeit her position in the society, unless her lover is of a lower caste.

Koch.

The Koches of Goalpara are quite distinct from the Bakoch of Kamrup, who find their counterpart in Goalpara in the Rajbansi. The Goalpara Koch is, as a rule, a very humble person who eats pork and carries palanquins, and who is looked upon as inferior to the Mech or Rabha.

Males	...	...	3,720
Females	...	...	3,419

Meches.

The name Mech is popularly derived from Mlechcha, and the proper tribal name is Bara usually mispronounced Bodo, which like many tribal names, means "man." The bulk of the Mech tribe inhabit the grassy uplands at the foot of the Himalayas, and they are believed to be absolutely identical with the Kacharis.*

Male	...	...	36,804
Female	...	...	36,956

They were at one time divided into several subdivisions. The names of two of these, "the heaven born," *swargiariya*, and the *bargoariya*, "those who speak in the public assembly" suggest that there were originally sections of the tribe who arrogated to themselves a certain superiority over the common people. The names of the other sections which are called after the plantain, betel-nut, the tiger, fishes, etc., seem to be of totemistic origin. The subdivisions have fallen into practical desuetude, and are now neither endogamous or exogamous sections. The only restriction on marriage, provided that it takes place within the tribe, is the one, common to most people, that prohibits the union of near relations. They abstain from beef,

* Viswa Sing, the first Koch king is said to have been the son of a Mechani by Siva.

but eat pork and fowls and are naturally looked down upon by their Hindu neighbours. At the same time the Meches do not consider themselves to be by any means at the bottom of the social scale, and decline to admit Garos, Rabhas, and the lowest Hindu castes into their community.

The great bulk of the tribe live on the high grassy ^{Crops and trade.} uplands at the foot of the Himalayas. Their villages are generally fenced in, but their standard of domestic architecture is distinctly low. They grow vegetables and fruit trees in their gardens, which are carefully fenced to keep out pigs and fowls, but the presence of these creatures gives the village a dirty and untidy appearance. Agriculture is their main occupation, and rice the staple crop grown. It is raised in fields which are irrigated from the hill streams, and which yield bumper crops though the soil is often poor and sandy. The water is brought in channels, sometimes several miles in length, dug by the combined labour of the villagers. The people are dirty in their habits, and extremely unsophisticated. Many of them hardly understand a word of Bengali or Assamese, and such trade as is carried on is chiefly transacted by barter. They seldom go to market, but during the rains traders come up the rivers and exchange earthen pots, dried fish, salt, and other articles for rice, at rates of exchange which are usually fixed by the panchayat. Typical rates are 5 seers of paddy (unhusked rice) for one seer of salt, which is equivalent to about 12 annas a maund for paddy and 6 seers of paddy for an earthen pot, while

dried fish fetches about twenty times its weight in grain. About half the produce of their rice fields is consumed by the Meches in the form of beer. They require but little cash except to pay their revenue, and the little they require is obtained by the sale of mustard, or, where there is no land suited for this crop, by working in the forests of the district.

Social
customs and
religion.

Marriage in almost invariably adult, and it is thought desirable that the bride should be older than the groom. The price of a girl is usually about Rs. 100, and if the man cannot provide this sum he works in her father's house, each year of service being valued at Rs. 20. Pregnancy in an unmarried girl entails no disgrace, provided that the father of the child is a man of her own tribe, and is willing to make an honest woman of her. On the occasion of the marriage swine or fowls are offered to the Bura Deo, and the friends and relations are regaled with a Homeric feast. Wealthy Meches who have come under the influences of Hinduism burn their dead, but the usual practice is to bury the body, or simply to throw it into the jungle to be devoured by jackals. Their principal God is called Bura Deo, who is represented by the Siju or cactus found growing in every courtyard, but sacrifices are also offered to a large number of minor deities. An old woman called the *deodhani* acts as the mediatrix with heaven, and takes a principal part in the pujas performed at the harvesting of the summer and winter rice. She also is called in in times of trouble to ascertain what deity is offended, and how he best may be

propitiated. Hinduism has, however, left its mark upon the simple tribal faith, and the Meches worship Mahadeo, Bishahari, Kali, and other Hindu deities. The fowls that they offer to these gods would, however, be a source of dire offence to the orthodox Hindu. They are said to have vague ideas of a future life and of heaven and hell, but their theories on the subject are extremely hazy.

The Namasudra or Chandal is a boating and fishing **Namasudra.**

Males	...	...	3,608
Females	...	...	3,064

caste, said by Manu to have sprung from the union of a Brahman woman with a Sudra, and therefore to be the lowest of the low. They are a cheerful and hardworking people but are heartily despised by their Hindu neighbours. A degraded Brahman acts as their priest and the village barber declines to shave them. A section of the Chandals has formed itself into a separate caste called Hira. They work as potters but do not use the wheel, laying on the clay in strips. Many of the Chandals have now taken to agriculture as their occupation.

The Rabhas are a section of the Bodo race and appear **Rabhas.**

Male	...	...	18,445
Females	...	...	13,691

to be an offshoot of the Garos. Their language is closely akin to Garo, and their original habitat seems to have been the northern slopes of the Garo Hills. Certain sections of the tribe which live on the borders of that district, have no word for north and south but describe the former idea by Bhutan, the latter by Tura, a fact which pretty clearly indicates the locality from which they originally came. Most of the Rabhas have,

however, left their ancestral home and settled in Dar-rang, Kamrup, and Goalpara. In the last named district the bulk of the tribe are to be found south of the Brahmaputra.

The Rabhas are divided into the following seven sections—Rangdania, Pati, Maitariya, Koch, Bitlia, Dahuria, and Sangha. The Rangdania lay claim to a position of superiority, but inter-marriage is allowed with the Patis and Maitariyas. Inter-marriage between the first three sections and the lower subdivisions of the caste is permitted, but only on payment of a fine of about Rs. 100. The Rabhas look down upon the Garos and in their turn are treated as inferiors by the Mech. Like the other animistic tribes they are fond of beer, pork, and chicken, but they abstain from beef. Their villages are not unlike those of the Mech, they have gardens and fruit trees, but pigs and fowls do much damage, and the homestead is very different from the green dankery of bamboos, fruit trees, and vegetables which surrounds the houses of the Hindus. Agriculture is their usual occupation and rice the staple crop grown. What money they require is usually obtained by sale of surplus produce or work in the forests of the district. Adult marriage is in vogue, and wives in Goalpara are said to be extremely cheap. As a rule they can be had for nothing, and it is only occasionally that the lover has to pay thirty or forty rupees for the object of his affections. Vermilion is smeared on the bride's forehead, a practice which does not obtain amongst most of the aboriginal tribes, but

the essential part of the ceremony is the killing of two fowls and the feasting of the villagers. The Pati Rabhas go further than this, and model their procedure as closely as possible on the Hindu ceremony. The dead, too, are generally burned, unless an epidemic is in progress when it is thought that the infection might be conveyed in the smoke of the funeral pyre. Their chief god is called Rishi and is represented by a pot of rice on a bamboo platform, to which offerings of fowls and pigs are made. After death their souls are said to be absorbed into Rishi, a Buddhistic form of doctrine, but their views on this subject, like those of other animistic tribes, are probably extremely vague.

The Rajbansis of Goalpara are one of the race castes **Rajbansis.**

Males	...	...	58,746.	of Assam, and apparently
Females	...	...	57,039.	correspond to the Bar Koch

of Kamrup. The name Koch has, however, to be avoided, as in Goalpara it is only used by a small and degraded section of the tribe, with whom the Rajbansi will have no concern. The Rajbansi or Koches, to use the title by which the tribe is more generally known, are common not only in Assam but in Northern Bengal. They appear to be of mixed lineage. On the west their affinities are with the Dravidian stock, on the east with the Mongolian. The centre of the Koch power was in Kuch Bihar, and in Goalpara the tribe were in a position to be much affected by the traditions of the ruling race. The Koch Raja and his court were a considerable factor in their lives, and the tribesmen have assumed the honorific title of Rajbansi, or "men

of royal stock." There seems to be no doubt that the Koch and Rajbansi of Assam are one and the same caste, but in Rangpur, it is said that the Rajbansis seem to be a distinct tribe of Dravidian origin, possibly akin to the Tiwar, which affects to despise the Mongolian Koch.* Rajbansis are allowed to bring water for Brahmans, and they abstain entirely from pork and liquor. In matrimonial matters they display a pedantic desire to conform to the dictates of orthodox Hinduism. In Assam Proper, marriage is usually adult, and the services of the priest are often dispensed with. In Goalpara, the Rajbansis regularly perform the *hompura* rite, and marry their girls at a comparatively early age. Nearly 10 per cent. of the Rajbansi girls under 12 had performed the marriage ceremony in 1901, as compared with less than 2 per cent. amongst the Koches of Kamrup. The staple occupation of the caste is agriculture. Meches and Rabhas are said to be admitted into the category of Rajbansis on conversion, but they have first to pass through the preliminary stages of *Madahi*, and *Sarania*. A Rajbansi who has risen in the world generally claims to be a Bhanga-Kshatriya and styles himself Das.

Religion. Forty-four per cent. of the population in 1901 were Hindus, 28 per cent. Muhammadans, and 27 per cent. were still faithful to their tribal forms of religion. The actual numbers returned under these three heads in each of the subdivisions, will be found in Table IV.

Hindu Sects. 83 per cent. of the Hindus returned the special

* Report on the Census of Bengal, 1901, page 382

sect to which they attorned. Of these, 6 per cent. described themselves as Saktists, or worshipper of the generative powers as manifested in the female; 4 per cent. as followers of Siva; and 90 per cent. as Vaishnavites. Nearly one fifth of the Vaishnavites were said to be Mahapurushias.

This form of Hinduism is thus described in the Assam Census Report for 1901 :

"Sankar Deb. the apostle of Vaishnavism in Assam, was born in 1449 A.D., and was the descendant of a Kayastha, who according to traditions had been sent, with six of his caste fellows and seven Brahmans, to Assam by the King of Kanaijpur as a substitute for the Assamese prime minister, who had fled to his court for refuge. The licentious rites of Saktism had aroused his aversion while he was still a boy, and his desire to found a purer system of religion was increased by the teachings of Chaitanya in Bengal. Like most reformers, he met with vehement opposition from the supporters of the established order, and he was compelled to leave his home in Nowgong and to fly to the inhospitable jungles of the Barpeta subdivision, where, in conjunction with his disciple, Madhab Deb, he founded the Mahapurushia sect, the main tenets of which are the prohibition of idolatry and sacrifice, disregard of caste, and the worship of God by hymns and prayers only. Sankar himself was, like a true follower of Chaitanya, a vegetarian, but the low-caste people, who formed a large proportion of his converts, found this injunction a counsel of perfection, and the Mahapurushias are accordingly allowed to eat the flesh of game, but not of domesticated animals, though, with a subtlety only too common in this country, they observe the letter of the law, prohibiting the spilling of blood, by beating their victims to death. The great centre of the Mahapurushia faith is the Sattrra at Barpeta, where a large number of persons persist in living huddled together, in defiance of all the laws of sanitation, and resist with surprising pertinacity all efforts to improve their condition. They are a peculiarly bigotted people, and are strongly opposed to vaccination, with the result that the mortality from smallpox in the neighbourhood of the Sattrra is exceptionally high. It was not long, however, before the Brahmans re-asserted their influence, and shortly after Sankar's death, two of his followers, who were members of this caste, established sects

called, after their founders, Damodariya and Hari Deb Panthi, which are distinguished from the Mahapurushias by the respect paid to the distinctions of caste and a certain tolerance of idolatry. A fourth sect was founded by one Gopal Deb, but it originally seems to have differed in no way from the Mahapurushia creed and subsequently its followers adopted the teachings of Deb Damodar. There is, in fact, practically no distinction between the Damodariyas, the Hari Deb Panthis, and the Gopal Deb Panthis, and the Vaishnavites of the Assam Valley can be divided into the Mahapurushia and Bamunia or "other Vaishnavas" as they have been called in the census tables. The former will accept a Sudra as a religious guide, worship no god but Krishna, and are uncompromising in their hostility to idols; the latter will only recognise Brahmans as their gosains, permit the adoration of other deities, such as Siva and Kali, in addition to that of Krishna and allow sacrifices to be offered in their honour."

The Bamunias are also more liberal in their diet, and will eat goats, pigeons, and ducks, a form of food that is not allowed to orthodox Vaishnavites in Bengal. Madhab Deb, like most religious reformers, was a strict disciplinarian. The story goes that the breach between him and Gopal Deb arose one stormy day when the party were returning to Barpeta by boat. Gopal Deb, anxious for the safety of his teacher, apostrophised the storm clouds passing overhead, and begged them to restrain their fury till Madhab had reached the shore in safety. This innocent remark was construed into an invocation of Varuna, the god of rain. Gopal Deb was denounced as an idolater, and was incontinently, by order of Madhab, flung out of the boat. Such treatment was enough to damp the enthusiasm of the most ardent disciple. Gopal Deb, wallowing in the water, gallantly shouted out defiance to his former leader, and warned him that in future he would be treated with uncompromising opposition.

A list of the temples, shrines, and *dhams* of Goalpara is annexed, but none of these places are of any note. The most important shrines are the ones at Jogighopa, Tukreswari, and Madhab. It is said that the thigh of Sati fell on the Tukreswari hill, when her body was dismembered by Vishnu. The place is, however, only visited by the people of the neighbourhood, so that this tradition is evidently not accepted by the Saktist community as a whole. A large number of monkeys live on the hill, and are fed by the devotees. The largest of these monkeys is styled their king and is served with food upon a silver dish. *Dhams* are priestly colleges, corresponding to the *sattras* of Assam, occupied as a rule by a few Vaishnavite monks. The most important *dham* is the one at Bistupur. Both *dhams* and temples possess, as a rule, small grants of land. The word temple is, however, almost a misnomer, as there is seldom anything more than a small hut enclosing the *lingum* or other sacred relic.

Animism.

Twenty-seven per cent. of the population in 1901 were still faithful to the primitive forms of tribal belief usually described as animistic. Broadly speaking their religious beliefs seem to fall under the following heads.

To account for the existence of the material world they put forward various theories, which are hardly more improbable than the stories of the creation given in most religious systems. The way in which the world came into existence is, after all, a matter of no very great importance, and the essential object of religion is to ensure a comfortable passage through life to its followers. No country or community is exempt from pain and trouble, and to the dwellers in the plains of India has been allotted a fairly liberal proportion of the ills of life. When the cattle die, or small pox or cholera visit the village, or other trouble comes, it is only natural to suppose that some body or something is the cause of these misfortunes. The simple tribesmen then

endeavour to ascertain the particular spirit from whose displeasure they are suffering, and try to appease him in whatever way they can. The bulk of the animistic population is found in the submontane tracts both north and south of the Brahmaputra.

The effect of the Muhammadan occupation of Goalpara is to be seen in the fact that in 1901, nearly 28 per cent. of the total population professed the faith of Islam, as compared with 9 per cent. in the neighbouring district of Kamrup. Practically all the Muhammadans belong to the Sunni sect. They are said to be fairly well grounded in the principles of their faith and to have been little affected by Hindu superstitions. There are no mosques of special sanctity, and prayers are usually said in a thatched hut. In Dhubri, however, there is the tomb of Shah Akbar, who was one of the Panch Pirs, or five wise men, who are venerated by Hindus and Muhammadans alike in Eastern Bengal. Assam was always regarded by the Musalmans as a country of witchcraft and enchantments. Mir Jumla accordingly summoned the Panch Pirs to his aid, as it was thought that they at any rate might overcome the spells of the Assamese, but unfortunately one of them succumbed himself and had to be buried in Dhubri. At the present day conversions to the faith of Islam are said to be far from common.

In 1901, there were 3,495 Christians in Goalpara, a figure which was only exceeded by the districts of the Khasi and Jaintia, and the Garo Hills. Successive enumerations have disclosed a considerable increase

amongst the native Christian population, the figures being, 1881, 392; 1891, 1,547; and 1901, 3,429. 2,122 of these persons described themselves as Baptists; and were censused in the Goalpara subdivision, where there is a branch of the American Baptist Mission; 1,282 were disciples of the Lutheran Mission that founded the Santal colony north of Dhubri, an account of which will be found in Chapter VII.

There is a most prosperous Christian village at Nisangram, near Damra, on the borders of the Garo Hills. This community was founded by two converted Garos, who in 1863, opened a school for Garo children at Damra. They then proceeded to lease some flat land from the Bijni Raja, invited their fellow tribesmen from the hills, and founded a flourishing village community at a place called Nisangram, which in 1904, occupied about 2,000 bighas of fertile and well irrigated rice land. There are about 150 houses in the village with its adjoining hamlets, 100 of which are occupied by Christian families. It is the largest Garo village in the Province, and the church numbered, in 1904, over 700 members. The people support their own pastor, and contribute to the maintenance of schools, and of six evangelists who are employed in preaching to the Garos. They also subscribe towards the support of an evangelist working amongst a tribe in Upper Assam. They have built, and contribute largely towards the support of three schools in Nisangram, and have built a chapel with belfry and bell, glazed doors, and windows. For thrift, prosperity, and general respectability the Garos

of Nisangram are an example to the remainder of the tribe.

The figures in the margin give details for other **Minor Religions.** religions that were not strongly represented in the district at the census of

Jains ..	...	...	457
Buddhists	...	...	346
Brahmos	...	...	50
Sikhs ...	...	...	2

1901. The Jains were most of them traders from Marwar. The Buddhists were Bhutias and Nepalese. The Brahmos represent the more highly educated section of the community and nearly all of them were living in Dhubri town. Though there are very few Sikhs in Goalpara, Dhubri, which is known to them as Damdam Gurudwara, is a place of pilgrimage for the followers of the Sikh faith. The small hill at Dhubri is said to have been artificially constructed in 1665 A. D., at the request of Guru Tez Bahadur. The Muhammadan army brought great quantities of earth on their shields from the Rangamati hill, and, when the Assamese flooded the country, they took refuge on the hillock they had so laboriously constructed. A small Sikh temple now stands at the foot of the hill.

As in the rest of Assam agriculture is the ordinary **Occupation.** occupation of the people, but the proportion of agriculturists, (84 per cent.), though high, is considerably below the average for the Assam Valley. The most densely populated portions of the district are permanently settled, and the number of persons supported by cultivation in 1901, who held direct from the state was only 72,700, as compared with 275,500 who were classified as tenants. The different classes of sub-tenure

and the rates of rent paid are discussed in the section on rents, wages, and prices. One of the most peculiar features in the economic organization of Assam, and one of the principal obstacles to its natural development, is the complete absence of a labouring class. In this respect, Goalpara, at first sight, appears to differ from the rest of the Brahmaputra Valley, as, in 1901, nearly eight per cent. of the population were said to be supported by farm service and field labour. The great majority of these labourers were, however, women. These women were, in all probability, only the wives and daughters of the ordinary cultivator, who help him to plant his seedlings and cut his paddy, and do not represent a labouring class in the sense in which that word is ordinarily understood. Other occupations that in 1901 supported more than one per cent. of the total population, were fishing, dealing in grain, general labour, and begging. Most of the general labourers were employed on the railway which was under construction in the district in that year. The great majority of the grain dealers were women, and, like the agricultural labourers, were probably merely the wives and daughters of the petty farmer. With an urban population of only a little over two per cent. of the whole, it is not to be expected that non-agricultural occupations would be of much importance in the district. The occupations recorded at the Census of 1901 were divided into eight main classes and the numbers returned under each head were as follows :—

Government 1647, or less than half per cent., Pasture

and agriculture 387,440, or 84 per cent., Personal services 5,538 or 1 per cent., Preparation and supply of material substances 37,143, or 8 per cent., Commerce transport and storage 7,403, or 2 per cent., Professions 4,156 or 1 per cent., Unskilled labour not agricultural 10,654 or 2 per cent., Means of livelihood independent of occupation 8,071 or 2 per cent. total 462,052.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Crops grown—Rice—Mustard—Pulse—Fibres—Storage and threshing of grain—Agricultural implements—Sugarcane—Preparation of molasses—Causes affecting the productiveness of land—Garden crops—Tea—Yield and value of crops—General remarks—Livestock—Forests—Classification of reserved forests—System of management.

**Crops
grown.**

The staple food crop of the district is rice. Other important crops are mustard, pulse, and wheat, which is believed to cover about 10,000 acres in the western portion of the district. Millets, such as *kaon* (*setaria italica*) and *china* (*panicum miliaceum*), are grown on sandy soils which are exposed to flood, as they can nearly always be reaped before the waters rise. Jute is largely grown for export; and it is said that as much as 2,000 acres are under the tobacco plant. Sugarcane is not much in favour, and the area under tea is insignificant. A little cotton is grown on the hills to the south of the district, but the bulk of the cotton that passes through Goalpara is imported from the Garo Hills. The general system of cultivation and the way in which the staple crops are raised is described in the following paragraphs.

Rice can be classified under three main heads *roa*, *ashu* or *bitri*, and *boa*. *Roa dhan* or transplanted paddy is first sown in little beds or nurseries (*bichan*) near the homestead. The land is broken up in April or May, is ploughed five or six times, and is carefully manured with cowdung and sweepings. The soil is not, however, reduced to a puddle. The seed, which has been selected from the largest ears of the previous year's crop, is sown broadcast over the bed in May and June, and, during the time that this operation is going on, water is sprinkled over the bed from a bamboo scoop. It comes up a rich emerald green, and at the beginning of summer these patches of the brightest green herbage are a striking feature in the rural landscape. In the meanwhile the fields are being got ready for the reception of the seedlings. The husbandman starts ploughing as soon as the soil is softened by the spring rain, and repeats the process from four to eight times, till he has reduced the land to a rich puddle of mud. After the third ploughing the field is harrowed, the little embankments, a few inches high, intended to retain the water are repaired, and if the fields adjoin the road or the village site they are fenced in with split bamboo. When the seedlings are about seven or eight weeks old, they are taken from the nursery bed and carried in large bundles to the field. Here they are planted out in handfuls (*guchi*), each of which contains four or five plants. The distance at which these handfuls are planted from one another depends upon the fertility of the soil, and on the time

Rice : *roa*.

at which they are put out. Seedlings planted at the beginning of the season will be placed eighteen inches apart, those planted later not more than six. It is not unfrequently the practice to steep the young plants in water before they are planted out, and if they seem too luxuriant the tops are cut off when they are removed from the nursery. Transplanting goes on from the beginning of July to the middle of September. The work is of a most arduous description and involves stooping for hours in a field of liquid mud, under the rays of a burning tropical sun. Before the end of the rains the crop is fully grown, though the ears are still empty, but, about the beginning of October, they begin to fill and the field to turn to a rich yellow.

From the middle of November to the middle of January harvesting is going on. The women grasp a handful of ears and cut them off near the head. These handfuls (*muthi*) are tied up with a piece of straw and left in the field for a few days to dry. When the grain is ready to be transported to the granary, the *muthis* are made into larger sheaves. Six to eight *muthis* form an *athi*, and five or six *athis* a *bojha*. A *bojha* is then affixed to either end of a sharp pointed bamboo called *bankua*, and the load, which is called a *bhar* and carried across the shoulder, is taken to the homestead by the men. The straw is not left in the fields as is customary in Upper Assam, but is stored and used as fodder; and is gradually acquiring a commercial value.

Ashu.

Ashu is generally sown broad-cast, and is grown under two different sets of conditions. When sown on marshy

land the usual procedure is as follows. In May, the jungle is cut down and burnt, and the land left till towards the end of the rains. The jungle that has sprung up in the interval is cleared in the same way, and ploughing begins at the beginning of February. The field is ploughed three times and harrowed, and the clods are broken up by a mallet. Another ploughing and harrowing follow, the seed is sown, and the land again ploughed and harrowed to ensure that the grain becomes thoroughly mixed with the soil. When the plants are about six inches high they are harrowed again and weeded, and finally harvested about the middle of July. The crop is, however, a precarious one, and is liable to be destroyed by a sudden rise of the river. The plants can live under water for as much as a week, but if after this time the floods do not retire they are permanently destroyed.

Ashu is sometimes sown in conjunction with *boa*, in the hope that, if the earlier crop is destroyed, the longer stemmed and sturdier *boa* may at any rate survive. It is also sown on high lands near the village site. The soil is poor, but is manured with the sweepings of the courtyard and the cowshed. Where grain is urgently required a crop of summer rice is sometimes taken from fields which are subsequently planted with *roa*. This is seldom done except in the Khuntaghat and Habraghat parganas. *Ashu* is also occasionally transplanted, the system of cultivation employed being substantially the same as that in force for *roa*. It is sown in the beginning of April, transplanted some six week later,

and reaped about the beginning of August. Transplanted *ashu* is generally grown on irrigated land. The crop ripens earlier than *roa* and thus gives a quicker return on the labour expended in its production.

Boa dhan.

Boa dhan is sown broadcast about the middle of March. It is grown in flooded tracts, and the embankments made between the fields are smaller than in the case of *roa* and are sometimes dispensed with altogether. It ripens about the beginning of December and is harvested in the same way as *roa*. There are several kinds of *boa* dhan, some of which increase in length as the water rises, so that the stalk finally attains to most extraordinary dimensions. One variety, which is known as *lewa boa*, is said to be sometimes as much as 24 feet long. *Mera boa* will grow to 15 feet in length, and *kekoa* and *salmati* to 18 feet. In Parbatjoar the longest variety is known as *amnakasha*. If there is a sudden flood and the rice is overtopped for any length of time the plant is drowned; but, when the water rises gradually, the rapid growth of the stalk keeps the ear above the level of the water.

Mustard.

Mustard, as has been already said, is often grown in conjunction with *ashu* on the riparian flats. The jungle is cut down in February and March, and if the land cannot be prepared in time for summer rice, is allowed to rot upon the ground. What remains is burned in October, the stumps dug out, and the land is then ploughed over four or five times. The seed is sown about the end of October, and the plant is ready to be pulled from the field about the middle of January. It

is generally left to dry for a few days, and is then tied in bundles and carried to the homestead, where it is threshed out by the cattle. Mustard is also grown on land which has been cropped with jute, and derives much benefit from the manure that is freely bestowed upon the latter crop. There is also a considerable area under mustard in the Bijni Duar.

Pulse is either grown on the riparian flats or on the higher land which has been cropped with summer rice. The following are the principal varieties of pulse raised in Goalpara. *Mash kalai*, (*phaseolus mungo* var. *radiatus*) a large dark coloured variety. The seed is generally sown in September and the crop is ripe about three or four months later. *Thaguri kalai* smaller and lighter coloured; *mug* (*phaseolus mungo* linn.); *khesari* (*lathyrus sativus*) which is sown in October or November and takes six months to ripen; *masuri* (*lens esculenta*) and *matar* (*pisum arvense*) which are cultivated in much the same way as *khesari*; and *arhar* (*cajanus indicus*) which is sown in April and May and takes about ten months to ripen.

The cultivation of jute entails the expenditure of a considerable amount of time and trouble, and stiff soils are sometimes ploughed as many as ten times. When it is sown on land which has not been enriched by deposits of the river's silt, manure is extensively employed. The plants are cut in August and September, stripped of their leaves, tied in bundles, and left to rot in pools of water for from fifteen to twenty days. When they are ready a handful of stems is taken up,

broken a foot or two from the lower end, and beaten to and fro in the water, till the inner part drops out. The fibres are then dried and are ready for transport to the market. Small patches of *khunkhora* or rhea (*boehmeria nivea*) are grown in the gardens of the fishing castes where they are heavily manured. The skin is stripped off from the stem and the fibre separated from the outer covering. The thread obtained is exceptionally strong and durable, but the difficulty of decortication has hitherto prevented the growth of rhea on a commercial scale. A little cotton is also grown on the hills in the south of the district.

**Storage and
threshing of
grain.**

When the paddy is brought from the field it is at once threshed out by the cattle.* It is next passed through a sieve and placed in a flat bamboo tray called *kula*. It is then jerked into the air and allowed to fall back into the tray, or held aloft and dropped slowly to the ground, till gradually the chaff is carried off. Paddy is stored in separate granaries called *gola*, but mustard, pulse, and the smaller grains in huge drums called *dhols*.

**Agricultural
implements:
the Plough.**

The agricultural implements in use are of a very simple character. The plough is usually made from the mango or sal tree, or from some other hard wood, and consists of three parts—the handle and body, which are usually all in one piece, the pole, which joins the plough at the junction of the handle and the body, and the yoke, which is merely a piece of wood,

* An experiment made by Mr. Darrah, D. L. R. & A, showed that nine bullocks took only 2 hours and 8 minutes to tread out $7\frac{1}{2}$ mds. of paddy.

fastened by rope at right angles to the pole, with pegs affixed to it to keep it from sliding from the necks of the bullocks. The front portion of the body is sharpened to a point which is shod with iron. This piece of iron is the only portion of the plough which the farmer has to purchase. The rest he usually makes for himself, though Garos and Meches sometimes make ploughs for sale. The whole instrument is suited to the wretched class of animal required to draw it. It weighs as a rule about 20 lbs. and when cattle are used the yoke seldom stands as much as 36 inches from the ground. When buffaloes are employed the plough is constructed on a larger scale. It is obvious that such an implement can only penetrate from three to four inches into the soil, but the wretched quality of the plough cattle prohibits the use of a more effective instrument.

The harrow (*moi*) is generally a bamboo ladder about eight feet in length, on which two men stand as it is drawn across the field. It is used to crush the clods turned up by the plough before mustard or summer rice is sown, and to reduce the fields required for wet rice to puddle. It is prepared by the cultivator himself from the bamboos growing in his garden. Clods are broken by the mallet (*kushi bari*) which is also made at home. Hoes (*kodalis*) are used to trim the embankments (*ails*) which help to retain the water. The head is bought in the bazar and costs from Re. 1 to Re. 1-4, and is fitted with a shaft by the farmer himself. Sickles, with which the rice is reaped, have

Other
implements.

also to be purchased, and cost from two to four annas. In *ashu* cultivation a large wooden rake (*bedha*), with teeth nearly one foot in length, is dragged over the crop by a bullock, when the plants are about six inches high. The *hachini*, a kind of trowel with a long handle, is used for weeding *ashu* rice. A large wooden mortar *oran*, and pestle *gain*, are generally used to husk the paddy.

Sugarcane. Sugarcane (*saccharum officinarum*) is usually grown on high land near the village site, and, as the soil is poor, it has to be well manured with cowdung. The crop is propagated from the tops of the best canes, which are cut off at harvest time and kept in a shady place. One of these tops yields on the average about five canes, and, as they contain but little juice, the cultivator does not sacrifice much of the gross product of his fields in the cause of reproduction. Four principal varieties of the plant are recognised. The *mugi* or white stands about seven feet high, and has yellow canes of a soft juicy texture. The *rangi* is shorter, harder, and thinner, and the canes are of a deep red or even purple colour. The *khagrai* is tall, hard, and very thin, and, though it does not yield so much juice as some of the other kinds, the quality of the molasses is very good. The red and white varieties of Bombay are tall and juicy, but the percentage of molasses obtained from a given quantity of juice is rather small. The land is hoed up till it is reduced to a fine tilth, and the tops planted in trenches between April and June. The patch is fenced with split bamboo, and there is usually a stout

hedge of *arhar dal* (*cajanus indicus*); but constant watching is required to scare away jackals and other animals, and an empty oil tin with a clapper is generally to be seen suspended over each field. While the crop is growing it is continually hoed and weeded, and about August the leaves should be tied up round each cluster of canes, which is a troublesome proceeding. The earth from the ridges is heaped about the roots to strengthen their hold upon the soil, and this process is continued until the relative positions of the ridge and trench are reversed, and the canes stand upon ridges with the trenches in between.

The iron sugarcane mill has now almost entirely displaced the home made mill of wood. When twelve or fifteen gallons of juice have been collected boiling begins. The furnace is hollowed out of the ground, and generally has two circular openings to receive the cauldrons, which are made of the most durable kinds of potters clay. When the juice has been reduced to the proper condition it is ladled into a wooden vessel and stirred for half an hour. As the stirring continues the liquid loses its dark brown colour, and assumes the consistency and hue of yellow mud. Sugar is extracted from molasses by the following process. The molasses are placed in a bamboo basket on a bamboo stool which is set over a pan. The basket is covered with a kind of grass called *khar*, which is continually sprinkled with water to keep it moist. At the end of about three weeks part of the molasses has crystallized into white sugar (*dalua chini*); the refuse (*naligur*)

Preparation
of molasses.

has trickled into the basket and is generally used not to eat but to mix with tobacco.

Causes
affecting
produc-
tiveness
of land.

The fertility of the rice fields mainly depends upon the following five causes, the water supply, the quality of the soil, and the liability to injury from flood, wild animals and birds, and shade. The first named factor is probably of most importance, as irrigated land in the submontane tracts yields bumper crops from poor and sandy soil. The soil of the district varies from pure sand near the Brahmaputra, to clay so stiff as to be utterly unfit for cultivation. In popular parlance land is divided into the following four classes, according as it yields a 16, 12, 8, or 4 anna crop—*awel*, *duem*, *suem*, and *ohaharam*. The animals which do most injury to the crop are pigs, and elephants and monkeys south of the Brahmaputra, field rats, and a bird called the *kaim*. Serious damage is sometimes done by an insect called the *gandhi* (*leptocorisa acuta*). It is a small bug which injures the rice plant by feeding on the stems and sucking all the sap from the young grains. It is most prevalent in July and August and is particularly *en evidence* during a spell of hot dry weather. High wind and rain drive it back into the jungle, and good results are obtained by lighting fires of vegetable refuse to windward. The best remedy of all is to collect the insects by smearing a winnowing fan with some glutinous substance and pushing it over the ears of grain, when many of the bugs will be found adhering to the fan. This remedy should be tried in the morning or late afternoon, as the insects do not feed in the heat of the day. A worm

called *utroonga* also does damage to young plants. Rain is wanted when *roa* is sown and is transplanted, but is not needed for the sowing of *ashu* and *boa*. During every stage of its growth the plant is benefited by moderate showers, but rain is absolutely essential at the time when the ears are first appearing. Hail storms in December sometimes lay the crop and add materially to the cost of reaping, but fortunately are very local in their action.

One of the most valuable of garden crops is the plantain (*musa sapientum*). As many as ten main varieties of this tree are recognized, but the most important are those known as *athia*, *manua*, *cheni champa*, and *malbhog*. The first two groups are again sub-divided into a considerable number of different species. The commonest form of *athia* is called *bhim*, a large tree which is found growing in the garden of nearly every house. The fruit is considered cool and wholesome, and is very generally used as food for infants. The *manua* is a somewhat smaller tree, with a white and slightly acid fruit. The *malbhog* and *cheni champa* are small trees, whose fruit is much appreciated by Europeans. The *athia* plantain is generally grown near the homestead, where it can obtain a plentiful supply of manure. The finer varieties are planted at a little distance to protect them from the earth worms, whose attacks they are hardly strong enough to resist. Sandy soil and heavy clay check the growth of the plant, and anything in the shape of waterlogging is most injurious. The trees are placed in holes about a foot wide and eighteen inches

deep, and are manured with cowdung, ashes, and sweepings. Young saplings take about fourteen months to flower, and the flowers take from three to six months to turn to fruit. The plaintain tree plays many parts in addition to that of fruit purveyor. The flower and the inner part of the trunk are much esteemed as a vegetable, the leaves serve as plates, and the trunks are used for decorative purposes on occasions of ceremony, and as food for elephants. An alkaline solution distilled from the sheaths and the corm is often used in place of salt. These portions of the tree are sliced, dried, and reduced to ashes. The ashes are placed in an earthen pot in which there are several holes lightly plugged with straw. Water is then poured over them which dissolves the alkali and trickles through the holes into the receiver below. The resulting product, which is known as *khar*, is used in place of salt, as a hair wash, and as a mordant with certain dyes.

Other garden
crops.

The betelnut (*areca catechu*) is grown almost as universally as the plantain, and, with the bamboo, forms the great trinity of trees in which the houses of the villagers are usually embedded. The plantation is hoed up, and kept clear of weeds, and the trees are most liberally manured with cowdung. The pan vine (*piper betle*) is frequently trained up their stems, and the leaf and the nut, which are invariably eaten in conjunction, are thus grown side by side. Mangoes, jack fruit, lemons, and cocoanut are also common. Tobacco is a plant which is to be seen growing in the majority of gardens. The seedlings are raised in carefully manured

beds in August and September. At the beginning of November they are transplanted, watered for a few days, and protected from the sun by little sections of the plantain trunk. The bed is slightly hoed up two or three times, and not more than ten or twelve leaves are allowed to grow on each plant, the remainder being picked off as they appear. The leaves are first gathered in February and March, and there is a second but much inferior crop about two months later. If required for chewing they are dried under a shed. When the tobacco is destined for the pipe the leaves are piled in heaps till they ferment, cut up and mixed with molasses, and then are ready for the hookah. The commonest forms of vegetable grown are, spinach (*basella alba*), different kinds of arums (*kachu*), different kinds of yams (*dioscorea*) and gourds, the common mallow *lafa* (*malva verticillata*), and radish *mula* (*raphanus sativus*), the sorrel *chuka sag* (*rumex vesicarius*), and the brinjal (*solanum melongena*), with potatoes, onions, garlic, chillies, ginger, and turmeric.

Tea is a crop of no importance in Goalpara. There are only four small gardens in the district which are situated at Lalkura, Marnai, and Tamai. The total area under plant is 700 acres. A full account of the tea industry will be found in the Gazetteers of the Sibsagar or Lakhimpur districts. Tea.

The outturn of different crops varies according to the character of the season, and also to a great extent according to the character and level of the soil on which they are grown. The statement in the margin shows Yield and value of crops.

the normal yield per acre laid down by the Agricultural Department. These figures only represent a general mean

			lb.	
<i>Roa</i>	...	...	1,000	there are many fields whose
<i>Ashu</i>	...	...	850	outturn varies largely from

the average. The yield of

rice, it may be premised, is expressed in terms of husked grain. Like the outturn the cash value of the crop can only be approximately ascertained. The prices obtained by the ryots vary to some extent in different parts of the district but probably average about Rs. 1 to 1-2 per maund of unhusked grain. Assuming that unhusked paddy yields 62 per cent. of clean rice, it would appear that the value of the harvest from an acre of *roa* is from 20 to 22 rupees: and from one of *ashu* from 17 to 19 rupees.

**General
remarks.**

Generally speaking the Hindus and Muhammadans of Goalpara are more careful and scientific cultivators than the inhabitants of Upper Assam. Manure is used for mustard and jute, and in the south-western corner of the district the villagers keep their cattle in the fields so that they may enrich them with their droppings. In the northern and eastern part of the district recourse is very generally had to irrigation. The villagers combine to dam the streams and *bils*, and carry the water through little channels (*dongs*) to their fields. Many of these channels are several miles in length, and some of them have attained to the dimensions of considerable streams. New staples seem to be adopted more readily in Goalpara than in Upper Assam. Jute

is cultivated on a commercial scale, and potatoes and various kinds of millets and pulses are coming into favour.

As in the rest of Assam the buffaloes are fine up-**Live stock.** standing animals, but the cattle as a rule are miserable little creatures. The goats are no better than the cattle and give very little milk. The only two varieties of buffaloes which seem to be recognised in the district are the *kachhar* and *bangar*. The former give a larger yield of milk and consequently command a higher price. The price of a bull buffalo ranges from Rs. 10 to Rs. 50, and of a cow from Rs. 15 to Rs. 70. The average price seems to be about Rs. 30 for the one and Rs. 40 for the other. Bullocks cost from Rs. 30 to Rs. 40 the pair, and cows from Rs. 10 to Rs. 15 each; though the price of a cow is said to be sometimes as low as Rs. 8, sometimes as high as Rs. 25. In the Eastern Duars, Nepalese cattle are occasionally to be found. They are said to be fine animals, almost as large as buffaloes. Cattle are grazed in swamps and marshes in the dry season, and on hills and high land lying waste in the rains. Generally speaking there does not seem to be any dearth of suitable pasture land, and it is only in the south-western portion of the district that the cattle have to be fed on paddy straw in the rains.

The southern half of the district is permanently **Forests.** settled and the Government forests are thus of necessity all situated in the Eastern Duars. They are divided into two classes, the reserves, which on June 30th 1904

covered an area of 787 square miles, and the unclassified state forests, which on the same date covered an area of 558 square miles. Unclassed state forest is, however, simply waste land at the disposal of the Government. The villagers are allowed to take it up at will for cultivation, and the greater part of it is entirely destitute of anything in the shape of tree growth.

Classification of reserved forests.

The 787 square miles of reserved forest are classified as follows: the figures in brackets represent the area in square miles. Pure sal forest (163); mixed sal forest (45); mixed forest (178); evergreen forest (83); sisu forest (4); khair forest (9); sisu and khair (26); grass land (183); land reserved for forest villages nearly all grass (66); rivers and swamps (24); other land (6). A considerable portion of the area shown as mixed forest would, however, be more properly classified as grass land,* though, now that these savannahs are protected from fire, the tracts that are suitable for the growth of trees are rapidly filling up with soft timber.

The reserves are seven in number. Bhumeswar is an isolated hill covering an area of 7 square miles in the extreme south east corner of the Sidli duar. It contains pure and mixed sal forest, but more than half the total area consists of precipitous slopes covered with rocks and grass. The Guma reserve is another isolated forest covering an area of 26 square miles, about 30

* Vide page 6 of Notes on the Goalpara Forest Division by Mr. T. J. Campbell. Shillong, 1896. This work is the authority for most of the statements made with regard to the Goalpara forests.

miles north of Dhubri. The high land is covered with almost pure sal forest, and the strips of low lying ground with which it is intersected, are gradually filling up with sum (*machilus odoratissima*). The rest of the forests lie at the foot of the Bhutan Hills. The Kachugaon, Ripu, Bengtol, and Chirang reserves form a compact block, 558 square miles in area, in the north-west corner of the district. Then comes a stretch of unreserved land occupied by the valley of the Ai, and in the north-east corner is the Bijni reserve which covers 196 square miles.

The Kachugaon reserve covers an area of 66 square miles, and is situated to the south of the Ripu forest. It contains hardly any timber of value, but was constituted a reserve in 1902 to enable the department to establish forest villages, with the object of providing a permanent labour supply for the Ripu reserve. The Ripu forest lies at the foot of the Bhutan Hills between the Sankosh and the Saralbhanga, and covers an area of 235 square miles. The sal reaches its best development in this reserve on the ridges between the numerous streams. Khair and sisu are found along the river beds, and there is a considerable area of mixed forest and grass land. The Chirang forest lies east of the Ripu and covers an area of 234 square miles. To the north it consists of evergreen forest, containing very valuable and well grown timber though its inaccessibility has hitherto precluded its exploitation; to the south it is well stocked with sal. The Bengtol forest, which lies east of Chirang, only covers an area of 23 square

miles. It contains sal in clumps, but there are large areas of grass land which are gradually filling up with soft woods. Considerably more than half the Bijni reserve consisted originally of grass land, which has, under the influence of fire protection, rapidly filled up with soft woods. The bulk of the remainder is mixed deciduous forest. Along the river banks there is a certain quantity of khair and sisu. No revenue has ever been realized from this reserve. The Bijni, Chirang, Ripu, and Guma forests were originally formed into reserves in 1875, and have since that date received various additions. The Bengtol and Bhumeswar hill reserves were not notified till 1883.

Trees.

The following are the principal trees which are found in the district:—sal (*shorea robusta*), sissu (*dalbergia sissoo*), sam (*artocarpus chaplasha*), champa (*melicia champaca*), jarul or ajhar (*lagerstrœmia flos reginæ*), gunserai (*cinnamomum glanduliferum*), poma or toon (*cedrela toona*), khair (*acacia catechu*), sida (*lagerstrœmia parviflora*), khakan (*duabanga sonneratioides*), gugra (*schima molis*), nahor (*mesua ferrea*), dowki poma (*alseodaphne*), patamari (*amoora spectabilis*), simul (*bombax malabaricum*), bola (*morus lævigata*), uriam (*bischoffia javanica*), aksi (*dillennia pentagyna*), kumbi (*careya arborea*), udal (*sterculia villosa*), harra (*terminalia citrina*), solet (*terminalia tomentosa*), bahera (*terminalia belerica*), paroli or ser pang (*stereospermum chelonoides*), jia (*garuga pinnata*), and gomari (*gmelina arborea*). Sal is, however, the only timber in which there is any appreciable trade.

A working plan for sal was prepared between 1889 and 1894 for the period from 1893 to 1903. A simple plan for trees other than sal was introduced in 1896 for the same period. The girth of exploitable trees is fixed at 5 feet. These plans are now under revision. Owing to want of purchasers it has never been found possible to dispose of the total number of trees permitted by the plan, and in some years there has been a serious deficit. On the other hand where the demand has been equal to the fixed yield the prescribed number of trees was not found upon the ground, and the number of marketable trees was probably over estimated.

System of
management

Trees selected by purchasers are felled early in the year, and cut into logs (*dhums*) between 6 and 7 feet in length, and over $2\frac{1}{2}$ feet in girth. They are roughly dressed and rolled to the neighbourhood of the nearest river. Towards the end of the rains, when there is plenty of water but no risk of flood, they are attached to canoes and floated down. This precaution is necessary as the specific gravity of sal is greater than that of water. These *dhums* are sold to purchasers from Eastern Bengal where they are used for boat building. There is also a considerable demand for sal posts, but this is principally met from the forests of the Zamin-dars. The construction of the Eastern Bengal State Railway through the Goalpara district has created a large demand for sleepers which has been met by the department. Labour is very difficult to procure and in order to facilitate the extraction of the timber $9\frac{1}{2}$ miles of portable tramway have been purchased.

Table VIII shows the revenue derived from each reserve. The bulk of the receipts are obtained from the Ripu, Chirang, and Guma forests. Sal is sold standing at Rs. 10 per tree or annas six per cubic foot at present schedule rates. Dead and fallen sal timber is sold at the rates entered in the schedule at page 159 of the Assam Forest Manual. First class trees other than sal sell at Rs. 6 each.* All other kinds at Rs. 2 each. Sal logs at the sale depots are sold at Re. 1 per cubic foot for timber over 4 ft in girth, annas twelve for timber between 3 and 4 feet in girth, and annas eight for logs under 3 feet. Sawn sal timber is now sold at Rs. 1-12 to Rs. 2 per cubic foot. Sleepers fetch Rs. 2 to Rs. 2-4 for metre gauge lines. The present sale depots are at Bilasipara on the Brahmaputra river, Bagribari on the Tipkai river, Kachukata on the Gora-fela river, and Barabadha on the Baunai river. For departmental purposes the forests are divided into four ranges, the Guma, Western, Eastern, and Bijni, ranges; and the Western and Eastern ranges are further subdivided into four circles. Fire and climbers do considerable injury. Table IX shows the area annually protected from fire and the cost incurred, and the out-turn of timber and fuel from the reserves and unclassed state forests. Goalpara is the only district in the Assam Valley in which forest operations are carried on on a commercial scale. Work is, however, much hampered by the scarcity and high price of labour, and the difficulty of communications, and good management is

* A list of these trees will be found at page 45 of the Assam Forest Manual.

required to ensure a profit on departmental operations. The sal timber of Goalpara is exported by boat to Eastern and Lower Bengal. The principal market is at Dacca but the districts of Mymensingh, Pabna, Faridpur, and Rangpur also absorb a large quantity. Hitherto transport by boat only has been possible, but the completion of the railway will probably alter present conditions by opening inland markets.

Timber is also extracted from the forests of the ^{The} Zamindars of Bijni, Chapar, Gauripur, Mechpara, and ^{Zamindari} forests. Parbatjoar. It is generally worked out in the form of poles.

CHAPTER V.

ARTS AND INDUSTRIES.

Industries—Silk—Pottery—Brass and Bell-Metal—Weaving—Lac—
Mat-making—Fishing.

Industries. The industries of Goalpara are of very small importance. Tea is manufactured, but the total output in 1903 was less than 200,000 lbs. A full description of the system of manufacture will be found in the gazetteers of the Lakhimpur or Sibsagar districts. Other industries include the rearing of the *eri* silk worm, the manufacture of rough earthenware and metal vessels, the weaving of cotton cloth, the rearing of the lac insect, and the manufacture of wickerwork mats and baskets.

silk. The silk industry is not nearly so important as in Assam Proper. *Pat* and *muga* are not reared and the only silk produced is that obtained from the *eri* worm. This worm (*attacus ricini*) derives its name from the *eri* or castor oil plant (*ricinus communis*) on which it is usually fed. From five to six broods are usually reared in the year, those which spin their cocoons in November, February, and May yielding most silk. The females, when they emerge, are tied to pieces of reed, and are visited by the males who are left at liberty.

The eggs are hatched in the house and take from a week to fifteen days to mature. As soon as the worms appear they are placed on a tray, which is suspended in a place of safety, and fed on the leaves of the castor oil plant. When fully grown they are about $3\frac{1}{2}$ inches long and of a dirty white or green colour. After the final moulting, the worms are transferred from the tray to forked twigs suspended across a piece of reed, and, when they are ready to spin, are placed on a bundle of dried plantain leaves or withered branches which is hung from the roof of the hut. The matrix of the cocoon is very gummy, and the silk, which is of a dirty white colour, has to be spun not reeled off. Before this is done the cocoons are softened by boiling them in water and a solution of alkali. Empty cocoons yield about three quarters of their weight in thread.

The industry is not of very much importance and very little silk is prepared for sale. Rangjuli, North Salmara, and the Eastern Duars are the chief silk producing tracts. The most useful garment made of *eri* is the *bor kapor* or *gilap* a large sheet sometimes as much as 20 feet in length by 5 feet wide, which is folded and used as a wrap in the cold weather. It costs from Rs. 8 to Rs. 12.

The earth used by potters is generally a glutinous clay, which is well moistened with water and freed from all extraneous substances. If it is too stiff some clean coarse sand is worked up with it. A well-kneaded lump of clay is then placed on the wheel, which is fixed horizontally and made to rotate rapidly. As the wheel

Pottery.

revolves the potter works the clay with his fingers and gives it the desired shape. The vessel is then sun-dried, placed in a mould, and beaten into final shape with a mallet, a smooth stone being held the while against the inner surface. It is then again sun-dried, the surface is polished, and it is ready for the kiln. The collection of the clay and firewood, the shaping of the utensils on the wheel, and the stacking of them in the kiln, form the men's portion of the work. The women do the polishing and the final shaping. The Hiras, however, do not use the wheel, but mould the vessel on a board, laying on the clay in strips, and the whole of this work is entrusted to the women.

The instruments employed are—the wheel (*chak*) which is about three feet in diameter and rotates on a piece of hard wood fixed firmly in the ground, the mould (*athali*), a hollow basin 16 inches long by $3\frac{1}{2}$ inches deep, the mallet (*baliya piteni*), and the polisher (*chaki*).

The principal articles manufactured are cooking pots (*hari and paitta*), large and small water jars (*kulsi*, and *bashna*), and larger vessels (*hari and janga*) with lamps, pipes, and drums. The profits of the business are said to be small, and the pottery made by local men is being gradually ousted by a superior quality of goods imported from Bengal, or made by potters from other parts of India, who come up to Goalpara in the winter and return to their homes before the breaking of the rains. The principal centres of the industry are at Fakirganj, Gauripur, Rupsi Satyapur, Rokakhata, Dubapara, and Marnai.

Brass and bell metal utensils are only manu-
 factured by temporary visitors from Sarthaibari and Hajo in Kamrup. Bell metal utensils are cast in moulds, but brass vessels are made out of thin sheets of that metal which are beaten out and pieced together. The implements of the trade consist of anvils of different sizes (*belmuri chatuli*), hammers, pincers, and chisels. The furnace is simply a hollow in the floor of the hut, and the bellows are made of goat's skin. When it is desired to join two sheets of brass together, nicks are cut in one edge, into which the other edge is fitted, and the two are then beaten flat. A rough paste made of borax and *pan*, a substance which consists of three parts of sheet brass with one part of solder, is then smeared over the join. The metal is heated, the *pan* melts, and the union is complete. The principal articles manufactured are small flattish bowls often used as drinking cups (*lota, bati*), jars for holding water (*kulsi gagari*), trays (*sarai*), boxes to carry betel nut and lime (*tema, temi*), and large vessels used for boiling rice (*thali*). Brass and bell metal.

The weaving of cotton cloths is carried on by rich and poor alike, and one or more looms are to be seen in the courtyard of almost every house. Though cotton is grown in the hills of the Province, and though many different dyes are to be found growing in its forests, the material employed is generally imported yarn, which is supplied in the requisite shades by the village shop-keeper. The loom consists of four stout posts which are driven into the ground so as to make a Weaving.

rectangle about 5' 10" $\times$ 2' 6", and are joined together at the top by cross beams. The implements required for the conversion of raw cotton into cloth, and the system of manufacture followed are described in the minutest detail in a "Monograph on the Cotton Fabrics of Assam," published by the Superintendent of Government Printing at Calcutta in 1897. Descriptions of mechanical processes of this nature are, however, at their best unsatisfactory, and are hardly intelligible without a series of diagrams. The total cost of the whole apparatus is about ten rupees, and as weaving only occupies the leisure moments of the women, the use of home made clothing helps to save the pocket of the villager. There is, however, but little doubt that weaving as an industry is commercially a failure, the price obtained for the finished article being out of all proportion to the time expended on its production. The principal articles made are *patanis* or cloths worn by women which are tied above the breast, large cloths called *gilap* or *bor kapor*, smaller shawls *pachara*, and *gamchas* or napkins often worn on the head.

Lac. Lac is reared on various members of the ficus family such as *pakri* (*ficus rumphii*), and on arhar (*cajanus indicus*), *buldobuk* (*kydia calcyna*), *dhop* (*ficus altissima*), *kukursota* (*grewia multiflora*), and other trees, but as far as is known the quality of the product is not affected by the tree on which the insect has been fed. The method of propagation is as follows. Pieces of stick lac containing living insects are placed in baskets and tied on to the twigs of the tree on which

the next crop is to be grown. After a few days the insects crawl on to the young branches and begin to feed and secrete the resin. They are left undisturbed for about six months and the twigs encrusted with the secretion are then picked off. A good sized tree yields from 30 seers to 2 maunds of stick lac, the best results being obtained from trees of moderate growth, which do not contain too rich a supply of sap. Two crops are generally obtained in the year, the first being collected in May and June, the second in October and November. The first crop is largely used for seed and it is the second which supplies the bulk of the exported lac. Ants and the caterpillars of a small moth sometimes do much damage to the insect, and a heavy storm at the time when they are spreading over the tree will destroy them altogether. Almost all the lac produced is exported in the crude form of stick lac. Most of the lac is raised by Garos, Rabhas, and Kacharis, the principal centres of the industry being Rangjuli, Darangiri, and Dhupdhara in the Habraghat pargana; and Dharidhari, Makri, and Khormauza in the Mechpara pargana. The cultivation of lac has only recently been introduced into the Dhubri subdivision.

Four kinds of mats are made in Goalpara, *i.e.*, *pati*, *kath*, *dhara*, and *kathiadhara*. *Pati* mats are manufactured by the Patia caste from the *patidoia* (*maranta dichotoma*), and cost from annas 8 to a rupee. *Kath* mats are made of *moj* (*saccharum ciliare*) and are woven in a frame much as cotton is woven on the loom. They are generally made to use and not to sell, but if they come to market cost from annas 6 to

annas 10. *Dhara* mats are made of plaited bamboo, and *kathiadhara* of reed. Toys are also made of sola pith by Malakars and a few Rajbansis in parganas Ghurla, Jamira, Parbatjoar, Khuntaghat, and Kalu-malupara, who sometimes turn-out quite artistic little images of gods and goddesses which cost some three or four rupees a piece. A rough kind of broad brimmed hat is also made from split bamboo and the leaves of the nahor (*mesua ferrea*) or sal tree (*shorea robusta*).

The fishing industry.

Fish are caught for home consumption by most sections of the community, but the professional fisherman is looked down upon and is generally a member of one of the humble castes such as the Jhalo, the Dom or Nadiyal, and the Hira, Manjhi, and Malla, amongst the Hindus; and the Datia amongst the Muhammadans. During the cold weather large quantities of fish are despatched from Dhubri to Calcutta, and to various places in Kuch Bihar and Rangpur in the neighbourhood of the railway. Fish is often salted or dried for use in Goalpara, but is not generally exported in this state. The varieties most esteemed for the table are the hilsa (*clupea ilisha*), the rui (*labeo rohita*), the chital (*notopterus chitala*), the bacha (*eutropiichthys vacha*), the magur (*clarias magur*), the ari (*arius*), the sol, the katla (*catla buehanani*) and the ghariya (*belone cancila*).

The principal nets in use are (1) the *uthar*, a large net which is spread on the surface of the water from a boat. The sides are weighted and sink together, and any fish that were swimming in the area covered are caught in the pockets round the weighted edges, (2) the *jata jal*, a triangular net the two sides of which are fastened

to two bamboos joined at the apex. A little below their junction the bamboos are fastened to two stout posts, on which they work on a pivot. The base of the net is allowed to sink into the water, and pressure is then applied to the vertex which raises the net and its contents. (3) the *bihiri* and *langi* nets, which are hung from crossed bamboos and are lowered from above into the water. (4) the *tanapaji* an ordinary drag net, (5) the *ber paji*, one end of which is fastened to a bamboo post in the water and the other end brought round in a circle, which is gradually contracted till all the fish within are caught; and (6) the *langi* a net which has two of its corners tied a little above the water to two stout posts. The front of the net is then lowered into the fishery and drawn up again, much as a drawbridge is raised and lowered. The *polo* resembles a gigantic wine glass with a short stem made of wicker work. It is generally used by women who walk through shallow water and keep pressing the rim of the glass on the mud at the bottom. Any fish that are caught are removed through an opening at the top. The *Juluki* is a smaller kind of *polo*. The *Jaka* is a species of wicker work shovel, which, like the *polo*, is generally used by women. They place the broad end of the shovel on the ground before them, and trample up the mud so as to drive the small fry into it. Conical bamboo traps which are called *dingaru*, *thupa*, *sepa*, *gui*, *bhari*, *darki*, *khaidon* and *katia* are worked on the principle of the lobster pot, and are placed in small streams or running water near the rice fields.

CHAPTER VI.
ECONOMIC CONDITION OF THE PEOPLE.
COMMUNICATIONS, TRADE, TOWNS
AND LOCAL BOARDS.

Rents—Wages—Prices—Food and dress—Dwellings—Economic condition of people—Conventional restrictions—Means of communication—Railways—Roads—Post and telegraph—Trade—Markets and fairs—Towns—Local Boards.

Rents. The rent law in force in Goalpara is Act VIII. B. C. of 1869. It is, however, seldom necessary to have recourse to law, and the total number of rent and title suits instituted in 1903 was only 250. Over the greater part of the district the population is extremely sparse, and it is this, no doubt, that has tended to prevent the growth of intermediate tenures between the cultivator and the zamindar. Except in the Gauripur and Karai-bari estates and in pargana Taria, the man who actually tills the soil holds as a rule direct from the zamindar. The *karari* are a special class of tenant, who break up land without previous measurement, and acquire no rights over the land so broken up. The *sukbasha* tenants in the Bijni estate hold at privileged rates of revenue, but are required to render certain services to their landlords. The relations between landlord and tenant seem to be satisfactory on the whole. Rents, as will be seen

from Table XIV A, are not high, and nowhere exceed Re. 1 per *bigha* for the best land cultivated with transplanted rice; while, in less favourable localities, the rate assessed is not even half that sum. Such cesses as are levied are not oppressive. In the Mechpara pargana, some opposition was of recent years aroused by the attempts of the landlord to levy a cess on forest produce removed for home consumption. No such charge is made either by Government or by the Bijni estate, and it was accordingly resented by the people.

In the Guma duar, a tract of 25 square miles was reserved in 1880 for the use of Santals, who were to be settled there by members of the Norwegian Indian Home Mission to that tribe. The colonists pay no revenue for the land occupied by their homesteads, and *rupit* and *faringati* land can be held free of revenue for the first year. In the second year they pay half the ordinary rates, and in the third year the full rates for the duar. In June 1904, the total number of colonists was 2,400 persons, who held nearly 3,200 acres of land or about one-fifth of the total area reserved for them. The people live in excellent houses, and the general appearance of their villages is one of quite unusual prosperity. The Santal colony.

The daily wages of an ordinary cooly range from 4 to 6 annas a day, but labour of this kind is not easily obtainable. Farm labourers are often paid in kind. Servants are usually paid from Rs. 3 to Rs. 5 per *men-sem*, in addition to their food. Advances are also given to induce them to take service. Wages.

Prices.

The abstract in the margin shows the average number of seers of common rice to be purchased for a rupee in each of the four decades ending with 1902. This

Average.	Seers per rupee.
1868-1872 ...	20.5
1873-1882 ...	17.1
1883-1892 ...	15.1
1893-1902 ...	11.9

statement shows a progressive rise in price, but the low average of the last decade is principally due to the fact that it includes several years in which famine was raging in India. In February 1904 and 1905, common rice was selling at Dhubri at the rate of 16 seers to the rupee. As the immense bulk of the population are cultivators, it is clear, that, so long as the local harvest is a good one, they do not suffer from a rise in prices. Since the reduction of the salt tax in 1903, the price of salt has fallen from 10 seers to 12 seers, for the rupee. Pulse is fairly steady at Rs. 2-8 the maund. Further details with regard to prices will be found in Table X.

Food and dress.

The staple food of the people is boiled rice eaten with pulse, spices, and fish or vegetable curry. Amongst the well-to-do, pigeon or duck occasionally take the place of fish, but fish is a very common article of diet. Goats' flesh is eaten by Muhammadans and members of the Saktist sect, and venison is always acceptable and is frequently procurable. The animistic tribes are very fond of pork, and consume large quantities of a strong fermented beer prepared from rice.

Sweatmeats usually consist of powdered grain mixed with milk, sugar, and ghi. The ordinary form of dress for a villager is a cotton *dhoti* or waist-cloth, with a

big shawl or wrapper, and generally a cotton coat or waist-coat. Hindu and Muhammadan women wear a *sari* or piece of cotton cloth, 15 feet long and 4 feet broad, which is fastened round the waist to form a petticoat and then brought over the head and shoulder so as to cover the rest of the body. Mech and Rabha women wear a smock drawn tightly across the bust and reaching half way down the calf. Men generally go bareheaded, but sometimes twist a handkerchief round their heads when working in the fields, and on sunny and rainy days have recourse to leaf umbrellas. Wooden sandals are in great request amongst all sections of the community.

The homestead of the ordinary peasant is generally **Dwellings.** separated from the village path by a ditch or bank, on which there is often a fence of split bamboo. Inside there is a patch of beaten earth, which is always kept well swept and clean. Round this tiny courtyard stand two or three small houses which are often little more than huts. The whole premises are surrounded by a dense grove of bamboos, plantains, and areca nut trees, and there are often numerous specimens of the arum family covering the ground. The effect is extremely picturesque, but the presence of all these plants and trees makes the whole place very damp and excludes all sun and air. At the back, there is generally a garden in which vegetables, tobacco, and other plants are grown. The walls of the house are made of reeds plastered with mud, or of split bamboo; the roof, of thatch, the rafters and the posts of bamboo. The general standard of

architecture is far from high, but Hindus and Muhammadans generally occupy somewhat larger and better built houses than those that are usually seen in Upper Assam, and the houses of the Muhammadans are sometimes quite commodious. The houses of the middle class are built on practically the same plan, but they are larger, and wooden posts and beams are often used in place of bamboo. The furniture of the ordinary cultivator is very simple, and consists of a few boxes, wickerwork stools and baskets, brass and bell metal utensils, glass bottles and earthen pots and pans. His bedding is a quilt made out of old clothes, and he either sleeps on a mat on the damp floor or on a small bamboo *machan* or platform. The well-to-do have beds, tables, and chairs in their houses.

Economic
condition
of
people.

Indebtedness is reported by the local officers to be fairly common, but it is probably in few cases that it is of a serious character. The rate of interest charged is said to vary from 12 to 60 per cent. per annum. Money is usually borrowed to pay for cattle, or marriage or *sradh* ceremonies, or, as a temporary expedient, to satisfy the demands of the rent collector. Cash is generally obtained by the sale of paddy, mustard, or jute, or by working in the forests. In this respect the position of the Goalpara raiyat is not so satisfactory as that of the inhabitants of Upper Assam, as there is no garden population to absorb his surplus produce. The natives of the district seldom work as coolies. They supplied only a very small part of the labour engaged in the construction of the railway, and the number

of Meches, Rabhas, or Kacharis who go to the tea gardens of Assam Proper is very small.

The people suffer from comparatively few conventional restrictions, other than those common to all Hindus. The Muhammadans do not plough upon a Friday. The Hindus abstain in the same way on the day when the moon is new and full, and on the last day of the month. In Bijni it is said that the villagers begin to transplant their *roa* paddy on a Wednesday or a Thursday, and to sow the *ashu* on a Tuesday or a Saturday. The last two days are, however, considered unsuitable for house building, and some hold that they are equally inauspicious for the transplantation of paddy. Conventional restrictions.

In the early days of our occupation of the Province communications with the outer world were usually maintained by water. The dak from Calcutta came overland *via* Rangpur, but the road was almost impassable in the rains. Boats took from twenty-five to thirty-five days to go from Goalpara to Calcutta, while the journey up stream occupied some eight days longer.* Means of communication.
Steamer.

This was the state of things till 1848, when the Government steamers were first deputed to ply between Calcutta and Gauhati. The experiment was attended with success, and, in 1860, the India General Steam Navigation Company entered into a contract to run a pair of vessels every six weeks to Assam. Passengers were carried by these boats, but the journey, though not uncomfortable, was still tedious and uncertain. In

* McCosh's topography of Assam page 9.

1884, a daily service of mail steamers was started between Dibrugarh and Dhubri. From Dhubri a steamer plied to Jatrampur, which had been connected by rail with Calcutta in 1884. The ports of call in the Goalpara district are Dhubri, Bilasipara, Goalpara, and Dalgoma. At the present day (1905), a through steamer carrying the mails runs every day from Dhubri to Gauhati, and from Gauhati to Dhubri. Another vessel plies daily in each direction between Goalundo and Dibrugarh, and calls at all the ports in the Goalpara district. Large cargo steamers with attendant flats also visit these places at stated intervals. Cargo is carried by the smaller passenger boats as well as by the larger steamers, but the freights charged are naturally somewhat higher. These steamers are owned and managed by the India General Steam Navigation Company, and the Rivers Steam Navigation Company.

Railways. In 1902, Dhubri was connected with Calcutta by rail. The line, which is a branch of the Eastern Bengal State Railway, enters the district at the Bishkhoa Nadi, and passes by the stations of Golakganj, Balajan, and Gauripur before reaching Dhubri. From Golakganj a line is now under construction which will pass through the districts of Goalpara and Kamrup till it reaches the Brahmaputra at a point opposite Gauhati, the present terminus of the Assam Valley branch of the Assam Bengal Railway. There will be stations in Goalpara district at Basbari, Tipkai Sisapani, Fakiragram, Kokrajhar, Basugaon, Abhayapuri, and Bijni, but no portion of this line is as yet (1905) open to traffic.

Two trunk roads run through the district. The north trunk road starts from Dhubri, and runs in a sweeping curve first west and then east, but always chiefly north, to Kachugaon nearly 50 miles away. There are inspection bungalows at the following places, the figures in brackets indicate the length of the stage. Balajan (10 miles), Paglarhat ($9\frac{1}{4}$ miles), Dingdinga ($10\frac{3}{4}$ miles), and Kachugaon ($19\frac{1}{2}$ miles). At the latter place the road turns sharply to the east, and runs through the Eastern Duars to Raha in Kamrup. There are inspection bungalows at the following places; Saralbhangha (11 miles), Garubhasa ($8\frac{1}{2}$ miles) Sidli (6 miles), Papragaoon (9 miles), Bijni (8 miles), and Raha ($10\frac{3}{4}$ miles). An alternative route from Dhubri runs close to the Brahmaputra to Bilasipara, and thence, through Chapar and North Salmara, to Raha. There are inspection bungalows at the following places; Manipur ($17\frac{1}{2}$ miles), Bilasipara ($9\frac{1}{2}$ miles), Chapar (17 miles), North Salmara (16 miles), and Raha ($17\frac{1}{2}$ miles). From Bilasipara a road runs north which presently divides into two branches. The western arm joins the trunk road a little to the west of Patgaon or Saralbhangha. The eastern branch meets it at Garubhasa. On the former there are inspection bungalows at Sasargaon (10 miles), and Datma (10 miles), on the latter at Kokrajhar (14 miles). Another road runs north from Jogighopa through North Salmara, till it meets the trunk road near the point at which it crosses the river Ai. Access to Bengal is given by two roads which take off, the one at Kachugaon, the other near

The roads
on the north
bank.

Pratapganj. There is an inspection bungalow on the former road at a point $19\frac{1}{2}$ miles west of Kachugaon, and on the latter road at Agamani.

Roads south
of the Brah-
maputra.

South of the Brahmaputra a road runs from Manikchar, past Fakirganj opposite Dhubri, to Dhupdhara on the borders of Kamrup. There are inspection bungalows at Kharuyabadha, Patakata, and Fakirganj. East of Fakirganj the road is known as the south trunk road, and is supplied with inspection bungalows at the following stages, Langrabhita (9 miles), Lakhipur ($10\frac{1}{4}$ miles), Baida ($9\frac{1}{2}$ miles) Agia ($10\frac{1}{4}$ miles), Krishnai ($8\frac{1}{4}$ miles), Rangjuli ($16\frac{3}{4}$ miles), and Dhupdhara (in Kamrup $8\frac{1}{2}$ miles) Goalpara town is connected with this trunk road, by roads that meet it at Agia, and at a point a little to the west of Krishnai. Another road runs from Damra to the Brahmaputra near Dalgoma. Minor roads to which no reference has been made are shown on the map appended to the Gazetteer. Altogether there were in the district in 1904, $159\frac{1}{2}$ miles of road kept up by the Public Works Department, and 356 miles maintained by the Local Boards. None of these roads are metalled, and they are thus liable to be much cut up if asked to carry heavy traffic in the rains. Many of the minor streams are spanned by good wooden bridges, but no less than 140 ferries are still maintained. Steam ferries ply across the Brahmaputra between Dhubri and Fakirganj and Goalpara and Jogighopa.

Post and
telegraph.

The following statement shows that there has been

a large development of postal business in Goalpara since 1871.

Number of post-offices in.		Number of letters and post cards omitting thousands delivered in.			Number of Savings Bank accounts in.		Balance at the credit of the depositors.	
1875-76	1903-04.	1881-82	1870-71.	1903-04.	1871-72.	1903-04.	1871-72.	1903-04.
12	34	32	60	478	29	1,836	800	2 98,000

The Savings Bank has also made satisfactory progress and considering the low rate of interest allowed, the volume of deposits is considerable. The figures given for 1872 were returned after the bank had only been opened for a few months.

The mail is brought from Calcutta by the Eastern Bengal State Railway up to Dhubri, and is distributed, as a rule by runners, over the district. A list of the post and telegraph offices in Goalpara will be found in the appendix.

The principal articles exported from the district are timber, mustard seed, jute, hides, unhusked rice, fish, silk cloth, betel nuts, cotton, and lac. The last two articles come for the most part from the Garo Hills and only pass through Goalpara. The articles received in exchange are European piece goods, salt, hardware, oil, tobacco, gram and pulse, flour, sugar, molasses, spices, bell metal utensils, and umbrellas. The principal centres of trade are Goalpara, Gauripur, Dhubri,

Trade.

Manikarchar, Bilasipara, and Bagribari. Jute is also exported in considerable quantities from Patamari. Nearly all the wealthiest and most important merchants are Marwaris. The bulk of the export and import trade passes through their hands, and, in addition to this, they do a considerable retail business. In the larger marts there are shops kept by Muhammadans from Eastern Bengal, who sell grain, salt, oil, spices, lamps, cloths, stationery, and general haberdashery. Salt, oil, grain, umbrellas, and piece goods are the ordinary stock in trade of the village shopkeeper. The natives of the district have only succeeded in appropriating a comparatively small share of the retail trade, and the great majority of the shopkeepers are Marwaris, Bengalis, or Up-countrymen. A list of all towns or villages in which there are three or more permanent shops will be found in the appendix.

Markets and fairs.

Internal trade is largely carried on at markets, to which the villagers come with the produce of their farms. In the Eastern Duars this trade is generally carried on by barter. Boat loads of dried fish and earthen pots are brought up the rivers in the rains, and exchanged for unhusked rice. The rate of exchange is fixed by a panchayat. Dried fish fetches from twelve to twenty times its weight in paddy, and five or six seers of paddy are given for each pot. A list of the villages in which markets are held is appended to this volume. In addition to these markets there are a few fairs, held on the occasion of religious festivals. A list of these fairs is given below, but none of them are of

very much importance.

Name of place at which fair is held.	Pargana in which situated.	Date on which held.	Estimated number of people attending.
Chhatrasal ...	Ghurlla .	Middle of March ...	25,000
Dalgoma ..	Habraghat ...	End of January or beginning of February.	700 or 800
Dhubri ...	Jamira ...	Middle of April ...	5,000
Gauripur ...	Do. ...	Do. ...	3 000
Do. ...	Do. ...	Middle of July ...	3,000

The greater part of the total trade still enters and leaves the district by water, and much of it is carried by country boat. The rivers also take a very prominent part in the distribution of the internal trade of the district.

The transfrontier trade carried on with Bhutan is of very small importance, and the total annual value does not exceed six or seven thousand rupees. The principal import is rubber, the principal export silk.

The only three places in the district that are worthy of the name of town are Dhubri, Goalpara, and Gauripur. Dhubri is situated on the right bank of the Brahmaputra in $26^{\circ} 1' N.$ and $89^{\circ} 59' E.$, at the point where the river turns south to enter the plains of Bengal. The town is connected by rail with Calcutta, and is a port of call for the river steamers, while a steam ferry which plies on the Brahmaputra connects it with the trunk road that runs along the south bank of the river

Towns
Dhubri.

up to Saikhoa. It is thus favourably placed as regards communications, but the development of the town is hindered by the fact that it occupies a small spit of land, about one-third of a square mile in area, which suffers severely from the erosive action of the Brahmaputra. The population shows no tendency to increase, and was 2,893 in 1881; 4,825 in 1891; and 3,787 in 1901. The headquarters of the district were transferred from Goalpara to Dhubri in 1879. In addition to the usual public offices the town contains a small church, a jail which has accommodation for 34 persons, a high school, a public library, a town hall, and a marble statue of Queen Victoria. There is a considerable export trade in jute, but business is tending to leave the place for other centres, such as Bagribari and Gauripur, as merchants are unwilling to sink money in warehouses on ground which is liable to be carried away by the river.

Dhubri was constituted a municipality under Act V (B. C.) of 1876, and subsequently Act III (B. C.) of 1884 was extended to the town in 1901. There are ten municipal commissioners, six of whom are elected, two are nominated, and two are ex-officio members. The principal sources of income are a tax on holdings at the rate of $6\frac{1}{2}$ per cent. of their annual value, a latrine rate, and the fees levied in the municipal market. Details will be found in Table XVII. There are nearly 7 miles of road within municipal limits, $2\frac{1}{2}$ of which are metalled. Drinking water is obtained from the Brahmaputra, and from three public and ten private wells. The

town is well lighted and in spite of its small size has no less than 52 lamps.

Goalpara is the largest town in the district, and is situated on the south bank of the Brahmaputra in 26°10' N. and 90°38' E. Prior to 1879 it was the headquarters of the district, and since the transfer the population of the town has shown no tendency to increase. The figures recorded at the three last enumerations were ; 1881, 6,697 ; 1891, 5,440 ; 1901, 6,287.

In addition to the magistrate's court, the public buildings include a small jail, a high school, a hospital with eighteen beds, post and telegraph offices, a police station, and a circuit house. Nearly all of these buildings are situated on a hill, whose summit is 400 feet above the level of the sea. This hill is surrounded on two sides by the Brahmaputra, and commands a fine view across the valley of that river, which at this point is much broken up by outlying ranges of hills. The native town is situated on the plain to the west of the hill, and, after the earthquake of 1897, sank below flood level. Embankments, fitted with sluice gates, have recently been erected, which protect the town from the floods of the Brahmaputra. The lower parts are, however, waterlogged by accumulations of rain water, which cannot be drained off till the river falls, and the shops and houses present a somewhat dilapidated appearance.

Goalpara was constituted a municipality under Act V (B. C.) of 1876 in 1878. There are nine municipal commissioners, eight of whom are elected by the rate payers. From Table XVII it will be seen that about

one-third of the municipal income was derived from a tax on persons, but the total income in 1900-01 was less than Rs. 7,000. The town covers an area of $1\frac{1}{2}$ square miles, and is served by $2\frac{1}{4}$ miles of metalled and $10\frac{1}{4}$ miles of unmetalled road. Drinking water is obtained from the Brahmaputra, from three tanks, six masonry wells, and a large number of private water holes.

Gauripur. Gauripur is a flourishing little town on the right bank of the Gadadhar river about five miles north of Dhubri. The zamindar of the Gauripur estate has a fine house here, and there is a high school, a dispensary, and a post and telegraph office. There is a considerable settlement of Marwari merchants, who do a large trade in jute, mustard seed, and piece goods, and there are blacksmiths, wheelwrights, potters, goldsmiths, confectioners, and the full complement of shopkeepers and artisans found in a small Indian town. There is also a large daily bazar where the ordinary products of the country can be obtained. The wants of the outer as well as of the inner man are not forgotten, and there are fifteen or sixteen sewing machines in the bazar which are diligently used for the manufacture of cheap clothing.

Local Boards In 1874, when Assam was erected into a separate Administration, the Government of India assigned one seventeenth of the net land revenue for local purposes. The district improvement fund was then started, and the administration of its resources was as before entrusted to the Deputy Commissioner assisted by a

committee. The actual amount placed at their disposal was not large and in 1875-76, the total income of the district funds of the Province was only Rs. 1,85,000, which was a small sum in comparison with the twelve and a half lakhs of rupees received by the Local Boards in 1903-04. In 1879, a Regulation was passed, providing for the levy of a local rate, and the appointment of a committee in each district to control the expenditure on roads, primary education, and the district post. Three years later the district committees were abolished by executive order, and their place was taken by boards established in each subdivision, which are the local authorities in existence at the present day. The Deputy Commissioner is chairman of the board of the head quarters subdivision; the Goalpara board is presided over by the Subdivisional Officer. The Local Boards are entrusted with the maintenance of all local roads within their jurisdiction, the provision and maintenance of local staging bungalows and dispensaries, and the supervision of village sanitation, vaccination, and the district post. They are also in charge of primary education, subject to the general control of the Education Department, and are empowered to make grants-in-aid to schools of higher grade, subject to certain rules. For these purposes, they have placed at their disposal the rate which is levied under the Assam Local Rates Regulation of 1879, at the rate of one anna per rupee on the annual value of lands, as well as the surplus income of pounds and ferries, and some minor receipts. This income is supplemented by an annual grant from Provincial funds. The principal

heads of income and expenditure are shown in Table XVI. The annual budgets of the boards are submitted to the Commissioner for sanction. Estimates for all works costing Rs. 500 or over must be submitted to the Public Works Department for approval, and important works, requiring much professional skill, are made over for execution to that department. Less important works are entrusted to the board overseers.

CHAPTER VII.

GENERAL ADMINISTRATION.

Land revenue. The permanently settled estates—History of the great Zamindaries—The Eastern Duars—Land revenue collection—Town lands—Excise—Opium—Country spirit—Laopani—Ganja—Income tax—Stamps—Public Works—Government—Criminal and Civil Justice—Registration—Police—Jails—Education—Medical—Vital statistics—Surveys.

For the purposes of land revenue administration ^{Land} Goalpara consists of two distinct tracts, (1) the area ^{revenue: the permanently settled estates.} covered by the jurisdiction of the three thanas of Goalpara, Dhubri, and Karaibari, as that jurisdiction stood in 1822; and (2) the Eastern Duars, which are situated in the north of the district and were annexed in 1864, after the failure of Mr. Eden's Mission to Bhutan.

The history of the permanently settled estates is closely bound up with the history of the district, and of the great families of landlords. After the downfall

of the Koch kingdom and the withdrawal of Mir Jumla from Assam in 1663 A. D., the Manas was fixed as the eastern limit of the Musalman dominions. The greater part of Goalpara seems to have been originally held at a low rate of tribute by the descendants of the Koch king, Parikshit, and, though they were no longer in theory independent princes, the Koch zamindars must have been princes in almost everything but name. Might, however, was largely right in a frontier district in those troublous times, and various other chieftains succeeded in securing broad tracts of territory for themselves.

A very light assessment was imposed upon these zamindars. They were lords of the marches, and from people of that class it has never been the practice in any age to require heavy contributions towards the exchequer of the central government. The assessment on the Bijni estate was originally fixed at Rs. 5,998, which was afterwards commuted to an annual contribution of 68 elephants. The zamindars of Karaihari, Kalumalupara, and Ghurla similarly paid their dues in cotton.* When the British acquired the *dewani* of the district, this tribute was accepted as land revenue. No settlement in detail was ever made, and it is doubtful whether Goalpara was included in the great decennial settlement which was made permanent in 1793. Government has not, however, thought fit to dispute the title of the zamindars.

* Vide Mills' Report on Assam and a note by Mr. Forbes in 1875, of which an abstract has been given in a paper by Mr. E. A. Gait, C. S., on the Koch Kings of Kamrupa, in J. A. S. B., Vol. LXII, part 1, No. 4. 1893.

The following statement gives details with regard to the various permanently settled estates :—

Details of
Estates.

Name of Proprietor.	Name of Estate.	Area in sq. miles.	Estimated cultivated area in acres.	Revenue demand.
				Rs. A. P.
Bijni Rani ..	Habraghat and Khuntaghat	942.63	102,478	2,355-1 0

* The compensation paid by Government on account of loss of market dues exceeds the land revenue assessed.

There are altogether 19 permanently settled estates covering an area of 2,384 square miles, which are distributed amongst six families of landlords. By far the largest area is held by the Bijni family, and when the district is more densely peopled this estate will become extremely valuable. At the present moment the Gauripur Raja has a larger rent-roll. The total land revenue demand on these estates is Rs. 11,411, or less than half a farthing per acre. Government, moreover, pays the zamindars Rs. 8,556 as compensation for the abolition of market dues and other illegal cesses, so that the net revenue is only Rs. 2,855 or a little more than a rupee per square mile. Local rates are, however, assessed at the rate of two annas for every acre under cultivation, and at the rate of one anna in the rupee on the actual profits, if any, obtained from land that is lying waste. Included in the area of 2,384 square miles of permanently settled land there are 40 estates, covering an area of 99,055 acres, which are held free of revenue.

The following table shows that the Bijni family is ^{The Bijni family.} descended from the great Koch king, Viswa Singh, who died in 1534 A.D.; though failure of heirs has more than once prevented the direct transmission of the blood.*

N.B.—The letter R signifies Raja or Rani of Bijni.

* The accounts of the Goalpara Zamindars have been condensed from reports received from their representatives.

† So Mr. Gait in the Koch Kings of Kamarupa. Indra Narayan places Chandra Narayan between Parikshit and Joy Narayan.

**History of
the estate.**

The history of the Bijni family is the history of a line, which gradually declined from the proud position of a powerful sovereign prince, to the comfortable, though less dignified status of a wealthy zamindar. The fortunes of the Koch kings down to the time of Parikshit have already been described. Parikshit's son, Vijita, is said to have been an infant at the time of his father's death, and during his minority the Ahom king took possession of Kamrup. A large tract of country in the western division of Raghu Rai's old kingdom, was conferred by the Emperor on one Kabi Shekhar Barua, the founder of the Gauripur family, and Vijita thus obtained but a portion of the inheritance of his forefathers. Sib Narayan, the second in descent from Vijita added, however, to the family estates by seizing the Bijni Duar, which he appears to have held at a low quit rent from the Raja of Bhutan. About the middle of the eighteenth century, during the minority of Debi Narayan and Mukund Narayan, Mechpara and Chapar were formed into separate zamindaries, and the Bijni estates assumed their present form. Amrita Narayan left no heir, and was succeeded by his wife Bhaggeswari, who adopted Kumud Narayan Bhup. He too died childless, and was succeeded by his two wives. The elder Rani died in 1891, and the younger wife is the present Rani of Bijni.

**Area and
resources of
estate.**

The Bijni estate consists of the two parganas of Habraghat and Khuntaghat, which cover an area of 943 square miles and are permanently settled for the

peppercorn revenue of Rs. 2,355.* It has already been explained that the revenue was originally fixed at Rs. 5,998, and that it was subsequently commuted to a contribution of 68 elephants. Great difficulty was, however, experienced in realizing the total number of elephants due, and, in 1788, this payment in kind was commuted to a small cash revenue. Habraghat consists of that portion of the district which lies south of the Brahmaputra and east of Goalpara town, Khuntaghat lies north of the river, and is bounded on the east by the Manas, on the north by Bijni Duar, and on the west by Parbatjoar. The Bijni Raja has also certain claims to 203 square miles in the Bijni Duar, on which there is at present assessed a revenue of Rs. 27,383. The local rates assessed on Habraghat and Khuntaghat are eight times the land revenue, and amount to Rs. 18,970; while in the Bijni Duar they are only Rs. 2,189. The rent roll of the former estate is said to be approximately Rs. 1,35,000, and of the latter Rs. 39,300. The rent roll thus exceeds the Government demand on account of land revenue and cesses by at least $1\frac{1}{4}$ lakhs of rupees. The Bijni Raja does not, however, depend entirely on his rent roll for his income, and he obtains considerable sums from his forests and fisheries, and from the thatching grass, grazing, markets, potters earth, and lac mahals. The rajbari is situated at Abhayapuri about three miles from North Salmara.

In comparison with Bijni, the Chapar zamindari is Chapar Zamindari. a comparatively small estate. It is situated in parganas

* Certain lakhiraj estates in these parganas are, however, held by the Gauripur zamindar.

Chapar and Kasba Gilla, and covers rather more than 200 square miles. The greater part of pargana Chapar consists of *chur* land lying on either side of the Brahmaputra, and only a small portion of the total area of the zamindari is at present under cultivation. The land revenue assessed is Rs. 626-3 and the local rates Rs. 1,638. The total rent roll of the estate is said to be between twenty-five and thirty thousand rupees, and, in addition to this, the zamindars derive a certain amount of profit from their fisheries and forests. The Chapar family are descended from a Rarhi Brahman, named Joy Narayan Sarma, who was a native of the Kishorganj subdivision of Mymensingh. This man obtained a grant of the estates from the Mughals, and the present zamindar, Babu Indra Narayan Chaudhury, is the eighth in succession to him. He was, however, only the adopted son of his predecessor. The family home is situated at Bilasipara.

**The
Gauripur
family.**

The Gauripur family is said to be descended from a Kayastha, who migrated from Tirhoot to Goalpara about the beginning of the sixteenth century A.D. The first member of the family of whom anything definite is known, was Kabi Sekhar, who succeeded his father in 1658, A.D. He seems to have been a man of some intelligence and enterprise, and was made *Dewan* by the Mughal Emperor. In this capacity he gave satisfaction to his royal master, and he subsequently received the title of Raja and a *lakhiraj* grant of 70,000 *bighas* of land. For three generations after Kabi Sekhar, father was followed by son, but, though the post of Kanungo was held by all, they do not appear to have distinguished

themselves in any way. Boal Chandra Barua, who succeeded to the headship of the family in 1778, acquired the zamindari of the five parganas of Ghurla, Aurungabad, Makrampur, Jamira, and Gola Alamganj. This in itself was a magnificent estate, but it was still further enlarged by Boal's grandson, Dhir Chandra Barua, who purchased parganas Kalumalupara, Noabad Faturi, and Dhubri, and a share in the Taria pargana. Dhir Chandra's son, Pratap Chandra Barua, did good service in the Bhutan war, and was made a Rai Bahadur in 1867. He made further additions to the estate, and in 1869 generously made over to Government the greater portion of pargana Dhubri when it was proposed to transfer the head quarters of the district to that place. He died without heirs in 1880, and the present zamindar, Kumar Prabhat Chandra Barua, was adopted by his widow. This young man attained his majority in 1896, and received the title of Raja as a personal distinction in 1901. The present Raja is a liberal and enlightened landlord. He has founded an excellent public library at Dhubri, and maintains a high school and dispensary at Gauripur, and a dispensary at Agamani.

The Gauripur estate lies in the western portion of the district. It includes the seven entire parganas of Ghurla, Jamira, Makrampur, Gola Alamganj, Noabad Faturi, Kalumalupara, and Aurungabad, with part of Taria, and certain *lakhiraj* estates in parganas Habraghat and Khuntaghat. The total area is about 55 square miles, which pays to Government Rs. 5,299 as land revenue, and Rs. 25,337 as local rates. The rent roll is

Area and
resources of
estate

said to amount to Rs. 2,34,000, and the miscellaneous revenue derived from forests and other sources to nearly Rs. 32,000 per annum. About two thirds of the estate is already under cultivation, but upwards of 160 square miles are still lying waste.

**The
Karaibari
zamindars.**

The present zamindars of Karaibari obtained their estates in 1809 A. D., when the zamindaris of that turbulent frontier chieftain, Mahendra Narayan, were attached for arrears of revenue and sold. The auction purchaser was one Rama Nath Lahiri, prime minister of Kuch Bihar, and it is from him that the present holders take their title.

The estates cover an area of 51 square miles, and pay a land revenue of Rs. 3,267. It is hardly, however, correct to say that any land revenue is paid, as Government makes an annual grant to the zamindars of Rs. 3,868, as compensation for the abolition of market dues, and the estate is thus a positive charge upon the general revenues of the country. The local rates at present (1904) assessed amount to Rs. 2,105. The estate has been partitioned into a twelve anna and a four anna share. The owners, who are a Brahman family, do not reside in the Goalpara district.

**The
Mechpara
estate.**

The Mechpara estate covers an area of 399 square miles, and is situated in the Mechpara pargana. This pargana occupies the strip of country lying between the Brahmaputra and the Garo Hills, and is roughly bounded on the east and west by lines drawn south from Goalpara and Dhubri towns. The land revenue assessed is Rs. 2,235-8 and the local rates Rs. 5,557-8. The total

rent roll is said to be about Rs. 1,30,000, and, in addition to this, the landlords derive a considerable income from their sal forests. The seat of the family is at Lakhipur.

The Parbatjoar estate covers an area of 276 square miles, and is situated in the pargana of that name, which lies north of the Brahmaputra and west of Khuntaghat. The land revenue assessed is Rs. 547-10, the local rates Rs. 8,579-7, and the income from the estate, including the profits derived from fisheries and timber, is said to amount to nearly Rs. 1,50,000. As the area of land at present under cultivation is said to be only about 21,000 acres, the rent-roll is presumably responsible for less than half the total income of the zamindars. The family is said to be descended from one Hatibar Chaudhury who received a grant of the estate twelve generations ago. An eight anna share is at present held by Babu Surendra Narayan Singh Chaudhury whose residence is at Bagribari, a five anna share is held by Srimoti Bimola Sundari Chaudurani who lives at Rupsi, and a three anna share by Srimoti Susila Sundari Chaudurani whose home is in Calcutta.

The Sidli Raja is not in possession of any permanently settled estates, but at the time of the annexation of the Bhutan Duars, he laid claim to the Duar from which he takes his name.

According to the family traditions the founder of the line was a Kshattriya named Chikna Narayan, who was adopted by a certain Raja of Sidli, named Bhim Singh. The descendants of this man were in the habit of paying tribute, first to the Mughal Emperor, and afterwards to the Hon'ble East India Company. About 1784, the

Bhutias seemed to have succeeded in imposing their suzerainty upon the Sidli Rajas, and continued to receive tribute from them till the outbreak of the Bhutan war. On the conclusion of that war the Duars were annexed by the British. The arrangements that were made for the satisfaction of the Sidli Raja's claims, are described in the following paragraphs.

**The Eastern
Duars.**

The Eastern Duars are five in number, and are situated in the following order going from east to west,—Bijni, Sidli, Chirang, Ripu, and Guma which lies south of Ripu. When the Duars were annexed by the British in 1864, the Bijni Raja laid claim to the Bijni Duar, on the ground that he had occupied the position of hereditary proprietor of this estate under the Bhutan Government. Similar claims were put forward to the whole of the Sidli Duar by the Sidli Raja. After a careful enquiry had been made into the validity of these claims, the Lieutenant-Governor, Sir William Grey, stated that he had no doubt that the Rajas of Sidli and Bijni had for many generations held that sort of position and enjoyed those rights and privileges which must be recognised as giving them the status of hereditary zamindars. He accordingly declared that they were entitled as zamindars to a settlement of the estates which they had managed and possessed under the Bhutan Government.* Settlement for a period of seven years was, accordingly, made in 1870 with the Sidli Raja, and with the Court of Wards on behalf of the minor Raja of Bijni. The Sidli Raja proved to be negligent and incapable, and after the first year the management

* Vide letter from Bengal Government No. 3594, dated 20th September 1867.

of the Duar was resumed by Government, 20 per cent. of the collections being allowed to him as *malikana*. On the expiry of this settlement the question was raised as to the area which could reasonably be considered to form the acknowledged estates of the two Rajas.

In 1882, the Government of India decided that 130,000 acres should be assigned to the Raja of Bijni and 170,000 acres to the Sidli Raja. In 1885, settlement was offered to the two zamindars for ten years at 80 per cent. of the rental for 1885-86, but the offer was refused. The Duars, accordingly, continued under Government management, the Sidli Raja receiving 20 per cent. and the Bijni Raja $7\frac{1}{2}$ per cent. of the collections. In 1900, settlement was again offered, and on this occasion was accepted by both of the families concerned, but before the lease could be executed the Sidli Raja died. His successor did not wish to undertake the responsibilities of management, and the original arrangement under which Government remained in charge of the estate and paid 20 per cent. of the collections to the zamindar was allowed to continue. In April 1903, a lease for ten years expiring on March 31st 1911, was issued to the Bijni Rani for her estates in the Bijni Duar. The lessor is required to pay 80 per cent. of the revenue demand of 1900-1901, and is allowed to appropriate any profits that may accrue from extension of cultivation during the term of the lease, but no rebate will be allowed, merely because the rent roll happens to decline. The levy of all *abwabs* or other cesses, and of all transit dues is forbidden, but the landlord has the right of enhancement of rent

according to the provisions of the rent law. The population is, however, so sparse that it is doubtful whether much enhancement would be possible.

**Settlement
of the Duars.**

The first settlement of the Eastern Duars was made by Mr. Beckett in 1872. The rates assessed were very moderate. In Bijni, Sidli, Chirang, and Ripu, they were only Re. 1-8-0 per acre of homestead or transplanted rice land, and 12 annas an acre for all other kinds of land. In Guma, they were even lower, and were Re. 1, per acre for the former, and Annas 8 per acre for the latter class of land.

The Ripu Duar was settled with the Chapar zamindar, and Chirang with the zamindar of Gauripur, but, when the leases ran out, they were not renewed, and settlement was made, as in Assam Proper, direct with the actual cultivators. In 1893, the rates in the portion of Guma, which lies west of the forest reserves and is inhabited by Rajbansis, were raised to Rs. 3 per acre for homestead, Rs. 1-14 per acre for land growing transplanted rice, and Re. 1-8 per acre for land under other crops. Elsewhere the rates assessed are the same as those imposed in 1872. The following statement shows the settled area of each Duar in that year and in 1903-04 :—

Duar.	Settled Area.		Total Area.	Population 1901.
	1872.	1903-04.		
	acres.	acres.	Acres.	
Bijni	23,003	25,851	239,482	25,850
Sidli	20,982	33,542	230,790	31,509
Chirang	933	817	316,890	1,081
Ripu	2,184	1,956	154,893	2,425
Guma	4,181	10,849	62,694	11,198
Total	51,243	73,015	1,004,749	72,072

The Duars are a very unprogressive portion of the district. The great mass of the population are Meches, who are still in a very primitive and undeveloped state, communications, except for the rivers, are bad, there are hardly any markets, and not much trade except in timber from the Government reserves. The surplus produce of the Duars is bartered with merchants who come up the rivers with boat loads of pottery and dried fish, and the rate of exchange is generally very favourable to the trader. The rates of revenue as compared with Assam Proper are distinctly low, but, in view of the backward condition of the people and the country, Government has taken no steps for their enhancement.

For the purpose of the collection of the land revenue Land revenue collection. the Duars which are still under the direct management of Government, are divided into five mauzas. Chirang and Ripu and Guma form two mauzas. Sidli is divided into three. Nearly four-fifths of the settled area has been cadastrally surveyed, and the maintenance of the land records is entrusted to a staff of 33 mandals under two supervisor kanungoes and a sub-deputy collector.

The town of Dhubri originally covered an area of Town lands. 875 *bighas* distributed as follows. A portion of the permanently settled estates of the Gauripur zamindar, generously surrendered to Government in 1869, 197 *bighas*; a resumed *lakhiraj* estate, 604 *bighas*; a portion of Bidyapara *lakhiraj* estate, 60 *bighas*; three other small *lakhiraj* estates 5 *bighas*; portion reserved by

the Gauripur zamindar 8 *bighas*. About one-fourth of this area has, however, been removed by the erosive action of the river. The town was settled for a period of thirty years with effect from April 1899. The rates assessed per acre vary from Rs. 21, rising to Rs. 30 in the eleventh year, to Rs. 9. Practically the whole of the land suitable for trade sites was settled *en bloc* with the Municipality for ten years in 1895. The area of this land is about 30 *bighas*, the revenue assessed Rs. 5 per *bigha*. The Municipality have spent a large sum in improving the site, and have sublet the land for Rs. 20 per *bigha* with a premium of Rs. 500 per *bigha*. A large portion of the land was, however, reserved for the municipal market. Under the rules now in force waste land taken up for the first time within town limits is to be settled ordinarily for a term of thirty years, at a fair rent not exceeding the annual letting value of the site. The lease of the land applied for may, if the Deputy Commissioner think fit, be put up to auction and knocked down to the highest bidder.

Excise.

Table XII shows the receipts obtained in the district in 1890-91, and in 1900-01 and subsequent years from the various heads of excise. The inhabitants of the district are unusually temperate. They consume very little opium or ganja, and are fairly moderate in the use of country spirit.* How marked is the difference between the eastern and western end of the Assam Valley can be judged from the fact that, though the population

*The contrast between this marked temperance, and the extraordinary prevalence of insanity is note-worthy.

of Lakhimpur in 1901 was only about four-fifths of that of Goalpara, the excise revenue of Lakhimpur in 1903-04 was more than eight times as great. The principal cause of this remarkable difference is the enormous quantity of opium consumed in Lakhimpur.

Prior to 1860, no restriction was placed upon the cultivation of the poppy. The evil effects of unrestrained indulgence in opium were undeniable and in that year poppy cultivation was prohibited, and the drug was issued from the treasury, the price charged being Rs. 14 a seer. This was raised to Rs. 20 in 1862, Rs. 22 in 1863, Rs. 23 in 1873, Rs. 24 in 1875, Rs. 26 in 1879, Rs. 32 in 1883, and Rs. 37 in 1890, the price at which it now stands. While Assam was under the Bengal Government licenses for the retail vend of opium were issued free of charge. In 1874, a fee of Rs. 12 per annum was levied on each shop, and in the following year it was raised to Rs. 18. Between 1877 and 1883, the right to sell opium in a particular mahal was put up to auction, but this system was found to be unsatisfactory, and in the latter year the individual shops were sold as is done at the present day. The general result of the Government policy has been to enormously reduce the facilities for obtaining the drug. In 1873-74, there were in the district 250 shops for the retail vend of opium; thirty years later there were only 24.

The figures in the margin show that there has been

	Maunds.	an extraordinary decrease in
1873-74 ...	84	
1879-80 ...	29	the quantity of opium con-
1889-90 ...	22	sumed in the district. At the
1899-1900 ...	8	

present day the amount is insignificant, but at no time was the drug really popular in Goalpara. In 1873-74, the number of maunds consumed was not much more than one fifth of the number in Lakhimpur, though the latter district had not one third of the population of Goalpara. The reduction in the number of retail shops and the imposition of a heavy duty, seem to have succeeded in almost killing out a habit which had never taken a firm hold upon the people. Opium is not a popular drug in North Eastern Bengal, of which Goalpara really forms a part, and in 1901-02 only 8 maunds were issued in the neighbouring district of Jalpaiguri, and 52 maunds in Rangpur.

Opium is generally swallowed in the form of pills, or mixed with water and drunk. Madak is made by mixing boiled opium with pieces of dried pan leaf, and stirring it over the fire. The compound is then rolled up into pills and smoked. Chandu is made from opium boiled with water till the water has all evaporated, and is smoked like madak in the form of pills. Opium is not generally smoked in Assam, and this form of taking the drug is usually supposed to be more injurious than when it is simply swallowed.

Country
Spirit
The still.

Country spirit is manufactured by native methods, and generally in what is known as the open still. The apparatus employed consists of a large brass or copper retort which is placed over the fire, to the top of which is fitted the still head, a compound vessel, part of which is made of earthenware and part of brass. The wash is placed in the retort, and, as it boils, rises in the form of

vapour into the still head, over the outer surface of which a stream of cold water is continually kept flowing. As the vapour cools, it is precipitated in the form of liquid, and is carried off by a bamboo tube into a vessel placed at the side. The mouth of this tube is open, and the spirit trickles from it into the vessel beneath, so that the outer air has access by this channel into the still head and retort in which the process of distillation is going on. In the closed still, the vapour passes down two tubes into two receivers where it is cooled and condenses into liquid. These tubes are so fixed to the receivers that the air cannot have access to the spirit, and, though distillation does not proceed so rapidly, the liquor produced is stronger than that obtained from the open still.

The material employed is generally the flower of the mohwa tree (*bassia latifolia*), which contains a very large Material employed. proportion of sugar, but its place is sometimes taken by molasses and rice. The following are the proportions in which these ingredients are generally mixed—mohwa 30 seers and water 60 seers, or mohwa 25 seers, molasses 5 seers, and water 60 seers, or boiled rice 20 seers, molasses 10 seers, and water 80 seers. *Bakhar*, a substance composed of leaves, roots and spices, whose actual ingredients are not divulged by the villagers who manufacture it, is frequently added to the wash, which is put to ferment in barrels. Fermentation takes three or four days in summer and a week in the cold weather, and the wash is then considered to be ready for the still.

The process of distillation takes about three hours. A retort of 40 gallons yields two gallons of spirit in an

hour and three quarters, three gallons in two hours and a quarter, and four gallons in three hours. The best and strongest spirit comes off first, and in the case of a brew of 30 seers of mohwa the first $3\frac{1}{2}$ gallons will be classed as *phul*, if they are at once drawn off from the receiver. If they are allowed to remain while two more gallons are distilled, the whole $5\frac{1}{2}$ gallons will be classed as *bangla*. The exact proportions vary, however, at the different shops, some distillers taking $4\frac{1}{4}$ gallons of *phul* or $5\frac{1}{4}$ gallons of *bangla* from 30 seers of mohwa. Occasionally only two gallons of spirit are distilled from 30 seers of mohwa, and the liquor is then called *thul*, is very strong, and is sold for one or two rupees a quart. *Thul* is also sometimes made by redistilling *bangla*. Only one kind of liquor is generally taken from each distillation, as, if the *thul* or *phul* were removed, the spirit subsequently distilled would be not only weak but impure. Strong liquor watered to reduce it to a lower strength is not considered palatable, and it seems to be the usual practice to distil the liquor at the actual strength at which it will be sold. One disadvantage of the cheaper kind of liquor is that it will not keep, and in four or five weeks it is said to lose all its spirituous qualities.

The statement in the margin shows that there has been a considerable increase in the revenue derived from country spirits. The system of auctioning the shops renders it impossible for Government to obtain its fair share

	No. of shops.	Revenue Rs.
1873-74	... 4	... 120
1879 80	... 12	... 4,060
1889-90	... 21	... 17,151
1899-1900	... 28	... 26,089

of the profits of the trade, in the absence of healthy competition at the sales; and it is to an improvement in this direction more than to anything else that the increase of revenue is due. There does not appear to be any reason for supposing that there has been any material increase of drunkenness amongst the people.

Laopani, or rice beer, is the national drink of the unconverted tribes, and a special name, *modahi*, is applied to those who have to some extent attorned to Hinduism, but have not yet abandoned their ancestral liquor. It is also taken by some of the humble Hindu castes. The following is the usual system of manufacture followed. The rice is boiled and spread on a mat, and *bakhar* is powdered and sprinkled over it. After about twelve hours it is transferred to an earthen jar, the mouth of which is closed, and left to ferment for three or four days. Water is then added and allowed to stand for a few hours, and the beer is at last considered to be ready. The usual proportions are 5 seers of rice and 3 chattaks of *bakhar* to half a *kulsi* of water, and the liquor produced is said to be much stronger than most European beers. Liquor is often illicitly distilled from *laopani* or boiled rice, by the following simple method. An earthen pot with a hole in the bottom is placed on the top of the vessel containing the *laopani* or rice, and the whole is set on the fire. The mouth of the upper pot is closed by a cone shaped vessel filled with cold water, and a saucer is placed at the bottom of the pot over the hole. The vapour rises into the upper of the two jars, condenses against the cold cone, with which the mouth

Laopani.

is closed, and falls in the form of spirit on to the saucer beneath. Care must of course be taken to see that the various cracks are closed against the passage of the spirituous vapour, but this can easily be done with strips of cloth. No attempt is made to restrict the manufacture of rice beer in moderate quantities for home use, as any attempt to do so would certainly lead to corruption and oppression. In a matter of this kind the influence of the Hindu gosains, and the pressure of local village opinion has more effect than any direct action of the Government.

Ganja. Ganja is usually mixed with water, kneaded till it becomes soft, cut into small strips, and smoked. Wild ganja grows very freely in Assam, but it is doubtful whether it is much used except as a medicine for cattle. It does not produce such strong effects as the ganja of Rajshahi, but the leaves are sometimes dried and mixed with milk, water, and sugar to form a beverage.

Income Tax. The receipts under the head of income tax in 1903-04 amounted to Rs. 25,566, nearly nine-tenths of which were obtained from the head, 'Other sources of income.' About one-half of this total was derived from estates taxable under the Act, an item which does not appear in any other district in the Province except Sylhet. These estates are various sources of miscellaneous revenue enjoyed by the zamindars, such as market tolls, receipts from timber yards, and income derived from forest produce. The bulk of the remainder was derived from 149 dealers in general goods, 36 money lenders, 26 dealers in provisions, and 13 pleaders. The receipts

under the head of income tax do not show much tendency to increase. In 1888, they amounted to Rs. 28,700, but by 1894 they had fallen to Rs. 19,700. From 1896 onwards there was an upward tendency, which reached the highest point in 1902-03, with Rs. 32,100. The decrease in the following year was due to the exemption of incomes between Rs. 500 and Rs. 1,000 per annum from taxation.

In 1903-04, the receipts under or the head of judicial stamps in Goalpara amounted to Rs. 37,167 and for non-judicial stamps to Rs. 14,993. These figures were exceeded by every district in the plains except Darrang and Nowgong. Stamps.

Public Works are in charge of an Executive or Assistant Engineer who is usually assisted by one upper and six lower subordinates. Public Works.

The Public Works Department are entrusted with the construction and maintenance of all the larger public buildings. The most important are the jail, the public offices, schools and telegraph offices at district and sub-divisional head-quarters, circuit houses, dak bungalows, and inspection bungalows on provincial roads.

The most important roads directly under the department are the trunk road along the south bank of the Brahmaputra from the Kamrup border to Fakirganj opposite Dhubri, with its continuation to Manikarchar; and the road from Dhubri to Kachugaon.

It has already been explained that Local Board works that require professional skill or engineering

knowledge are usually made over to the Executive Engineer for execution. The principal difficulties with which the Department has to contend are the absence of an artisan class, and the scarcity and dearness of unskilled labour.

Government. For general administrative purposes the district is divided into two subdivisions. Dhubri is under the immediate charge of the Deputy Commissioner, and Goalpara is entrusted to an assistant magistrate who is usually a native of the country. The Deputy Commissioner is allowed two subordinate magistrates and a sub-deputy collector as his assistants at Dhubri.

Criminal and civil justice. Appeals lie to the Deputy Commissioner, from orders passed by magistrates of the second or third class, and from the orders of first class magistrates to the Judge of the Assam Valley districts, whose head-quarters are at Gauhati. Appeals from the Judge lie to the High Court of Judicature at Fort William in Bengal. In 1902, there were four stipendiary magistrates in the district, who decided 717 original criminal cases. In the course of these proceedings 2,227 witnesses were examined. Altogether there were 852 cases under the Indian Penal Code returned as true, the immense majority of which were either offences against property or against the human body. There is not much serious crime in Goalpara, and most of the offences were either house-breaking and house-trespass or petty thefts.

The civil work of the district is not heavy and the Deputy Commissioner acts as subordinate judge, while one of the assistant magistrates in each subdivision acts

as munsif. In 1902, the subordinate judge heard 9 original cases and 18 appeals, while 1,229 cases were disposed of by the munsifs. Only a little over one-seventh of these cases were contested, and a large proportion of them were simple money suits. In spite of the fact that the greater part of the district is permanently settled the number of rent and title suits is very small. Special rules are in force for the administration of civil justice in the Eastern Duars. The Code of Civil Procedure is not in force. The rules are fit for the simple and primitive people inhabiting the tract, and provide that, unless one or other of the parties objects, civil suits should be disposed of by a village panchayat. The panchayats are chosen by the parties to the case, and the proceedings of the panchayat when endorsed by the Deputy Commissioner or his assistants are final. When the parties refuse to refer their suit to the panchayat the case is tried by the Deputy Commissioner or his assistants. No appeal lies as a matter of right from the decision of the Deputy Commissioner or his assistants, but the Commissioner of the Assam Valley districts or the Deputy Commissioner may, if he sees fit, upon application of the parties, call for and revise the proceedings of the lower court.

The Deputy Commissioner is also the Registrar of **Registration**. the district, and an assistant magistrate in each sub-division acts as sub-registrar. A rural sub-registrar's office was established at Gauripur in 1902. The number of documents registered in 1903 was only 2,174, but even this moderate figure was not equalled or exceeded by any district in the Assam Valley.

Police.

The civil police are in charge of a District or Assistant Superintendent of Police. The sanctioned strength consists of 2 inspectors, 25 sub-inspectors, and 243 constables. 113 smooth bore Martinis are allotted to Goalpara, and a reserve of men is kept up at the district and subdivisional head-quarters who are armed with these weapons and are employed on guard and escort duty. Up-country men, Nepalese, and members of the aboriginal tribes are usually deputed to this work, though attempts are made to put all the constables through an annual course of musketry. The foundation of the police system is the village chaukidar. He is required to report all serious crime to the officer in charge of the police station within which his village is situated, to arrest persons committing such crimes in his presence, to collect vital statistics, to observe the movements of bad characters, and generally to inform his official superiors of anything likely to affect the peace and good administration of the district. In addition to their regular duties in connection with the prevention and detection of crime, the police are required to check the returns of vital statistics, manage pounds, enquire into cases in which death has not been due to natural causes, to furnish guards and escorts, and to serve all processes in warrent cases.

A list of the thanas and outposts with the strength maintained in each will be found in Table XIX.

Jails.

There is a subsidiary jail at Dhubri with accommodation for 24 convicts, and a magistrates lock-up at Goalpara. The industries carried on in these jails are

mustard oil pressing and bamboo and cane work at Dhubri, and oil pressing at Goalpara. The jail gardens also afford occupation to the prisoners. Most of the convicts were originally employed on extra-mural labour, but this form of occupation has been to a great extent abandoned as it was hardly compatible with the strict enforcement of discipline. Prisoners are not kept in these small jails for more than three months, and those sentenced to a longer term are transferred to Gauhati. Mr. McCosh, who was civil surgeon of Goalpara in 1835, states that at that time the convicts were allowed to provide their own rations, receiving a small allowance for the purpose, from which the more thrifty were able to save money which they lent out on usury. "Many of the prisoners" he says "lead rather a happy life, and considered themselves as Company's servants. They take as much pains to burnish their irons as they would a bracelet, and would not choose to escape though they had an opportunity."

In 1841, Mr. Robinson of the Gauhati College Education. described the state of education in the valley as being "deplorable in the extreme."* He pointed out that, unlike the Province of Bengal, where every village had its teacher supported by general contribution, provincial schools had only recently been introduced in Assam. In 1847-48, there was one secondary and 9 primary schools in the district. The next few years witnessed very little progress as on the occasion of Mr. Mills' visit in 1853 there were only 10 schools of

* A descriptive account of Assam, page 277.

all grades. 1874-75 is the first year for which complete statistics are available, and the following abstract shows the progress of education since that year. Figures for years subsequent to 1900-01 will be found in Table XXI.

Year.	No. of secondary schools.	Pupils.	No. of primary schools.	Pupils.	Total No. of pupils.	No of persons in district to each pupil.	Percentage under instruction to those of school-going age.

High Schools.

High schools are those institutions which are recognised by the Calcutta University as capable of affording suitable preparation for the Entrance examination. The boys are taught from the earliest stage of their education up to the Entrance course as prescribed by the University of Calcutta, but many leave school without completing the course. Till recently English was taught in all the classes. The boys in the lowest class no longer learn that language, but the standard of instruction is higher than that prevailing in lower secondary (middle) schools. English is the medium of instruction in the first four classes of high schools, in the lower classes and in other schools the vernacular is employed.

There are four high schools in the district which are situated at Dhubri, Goalpara, Abhayapuri and Gauripur. The first is a Government school but more than half the total expenditure is met from fees. The second receives

a grant in aid, and the two last are respectively maintained by the Rani of Bijni and the Gauripur Raja.

There are middle English schools at Bilasipara, Bagribari, Manikarchar, and Dalgoma. The middle vernacular schools are situated at Sukchar, Patamari, Chhatrasal, South Salmara, Bijni, Atugaon, Putimari, Amguri, Goalpara, and Dhubri. Almost all the pupils in the middle vernacular schools in 1903-04 were, however, reading in the primary classes and for practical purposes they are little more than superior primary schools.

**Middle
Schools.**

The course of instruction at middle English and middle vernacular schools is the same, with the exception that English is taught in the former and not in the latter. The following are the subjects taught in the middle vernacular course:—(1) Bengali comprising literature, grammar and composition, (2) History of India, (3) Geography, (4) Arithmetic, (5) Elements of Euclid (Book I), Mensuration of plane surfaces and surveying, (6) Botany and Agriculture.

Primary education is again divided into upper and lower, but the proportion of boys in upper primary schools is only nine per cent. of the total number. The course of study in lower primary schools includes Reading, Writing, Dictation, Simple Arithmetic, and the Geography of Assam. In upper primary schools the course is somewhat more advanced and includes part of the first book of Euclid, Mensuration, and a little History. The standard of instruction given still leaves much to be desired, but efforts have been recently made

**Primary
Education.**

to improve it, by raising the rates of pay given to the masters. Fixed pay is now awarded at average rates of Rs. 8 per mensem for certificated and Rs. 5 per mensem for uncertificated teachers, supplemented by capitation grants at rates ranging from 3 annas to 6 annas for pupils in the three highest classes.

Medical. The district is in the medical charge of the Civil Surgeon who is stationed at Dhubri. It contains 14 dispensaries, and the supervision of the work done at these institutions is one of the most important of his duties. He also acts as Embarkation Agent, as Medical officer of the Jail, and controls and inspects the vaccination department.

**Lack of
sanitation in
rural areas.**

It has already been suggested in the chapter on population that there may be something in the climate, the subsoil level of the water, or some other factor which for the present remains obscure, which is prejudicial to life and health, but there can be no doubt that the conditions under which the people pass their days are not conducive to a long mean duration of life. Their houses are small, dark, and ill ventilated, and the rooms in summer must be exceedingly close and oppressive. They are built upon low mud plinths, and are in consequence extremely damp, and the inmates, instead of sleeping on beds or bamboo platforms, which would cost them nothing to provide, often pass the night on a mat on the cold floor. Their attire, which is suitable enough for the warm weather, offers but a poor resistance to the cold and fogs of winter, and many lives are annually lost from chills, which might

have been prevented by the purchase of a cheap woollen jersey. The houses of the Hindus and Muhammadans are buried in groves of fruit trees and bamboos, which afford indeed a pleasant shade, but act as an effective barrier to the circulation of the air, and increase the humidity of the already over-humid atmosphere. Sanitary arrangements there are none, the rubbish is swept up into a corner and allowed to rot with masses of decaying vegetation, and the complete absence of latrines renders the neighbourhood of the village a most unsavoury place. There are a few wells constructed by the Local Board in the large villages, but their number is small in proportion to the total population, and drinking water is usually drawn either from shallow holes, from rivers, or from tanks in which the villagers wash their clothes and persons. All of these are undoubtedly factors which contribute to produce a high mortality, and nearly every one of them could be eliminated.

Vital occurrences are reported by the village chaukidars in writing to the police, and the statistics, ^{Vital statistics.} though admittedly incomplete, are less inaccurate than those returned from other districts of the Province. The reported birth rate and death rate worked out on the mean population between 1891 and 1900 were alike 39 per mille. In 1903, the recorded birth rate was 43, the death rate 33 per mille.

Fever and bowel complaints are the forms which ^{Causes of mortality. Cholera and small pox.} death most often takes in the Goalpara district, at any rate according to the official returns, but so little

reliance can be placed on the diagnosis of the reporting agency, that the figures hardly repay examination. Most fatal illnesses are accompanied by a rise in temperature and the villagers are in consequence very prone to ascribe every death to fever. Epidemics of cholera from time to time produce a high mortality, for though it is apparently endemic in the district, it occasionally breaks out with quite exceptional violence. The abstract in the margin shows the recorded death

		Cholera death rate per mille.
1884	...	4.9
1886	...	4.9
1891	...	6.4
1895	...	6.7
1897	...	10.4
1899	...	5.1

rate from this cause in the years when cholera was most prevalent. Cholera usually appears in the police stations of Bilasipara, Chapaguri, and Agamani. The bacillus, thrives

in the muddy banks of tanks and rivers, when they are warmed by the sun and moistened by the showers of spring. The disease is thus most prevalent between April and July, and again in November and December when the water is drying up. On the outbreak of an epidemic a hospital assistant is sent to the affected villages, and cholera pills are distributed amongst the people, but it is difficult to do much for their relief. Small pox also appears from time to time in a virulent form. The highest death rates per mille recorded from this cause during recent years were 6.1 in 1894 and 1.2 in 1895. The people appreciate the advantages of vaccination, and during the five years ending with 1901-02, 44 per mille of the population were annually protected.

The most deadly lethal agent in the district has, however, been the mysterious form of fever known as *kala-azar*. The following account of this disease is extracted from the Report on the Census of Assam in 1901.

“When first referred to in the Sanitary Reports of the province, it is described as an intense form of malarial poisoning, which was popularly supposed to be contagious. The Civil Surgeon of Goalpara rejected the theory of contagion, and in 1884 expressed the opinion that *kala-azar* was simply a local name for malarial fever and its consequences. In 1889-90, a specialist (Surgeon-Captain Giles) was appointed to investigate both *kala-azar* and the so-called *beri-beri* of coolies, and he rapidly came to the conclusion that *kala-azar* and *beri-beri* were merely different names for *anchylostomiasis*, and that the mortality was due to the ravages of the *dochmius duodenalis* a worm which lives in the small intestine. This theory corresponded with the observed facts to the extent that it admitted, what at that stage of the enquiry could hardly be denied, that *kala-azar* was communicable, the uncleanly habits of the natives of the province affording every facility for the transfer of the ova of the parasite from the sick to the healthy ; but the support which was given to Dr. Giles’ views by local medical opinion was withdrawn when Major Dobson proved by a series of experiments that *anchylostoma* were present in varying numbers in no less than 620 out of 797 healthy persons examined by him. In 1896, Captain Rogers was placed on special duty to make further investigations, and, in addition to demonstrating various differences of a more or less technical character in the symptomatology of the two diseases, he pointed out that, whereas *kala-azar* was extremely inimical to life, the number of cases of *anchylostomiasis* that terminated fatally was by no means large. The conclusion to which this specialist came, after a very careful enquiry, was that the original view was correct, and that *kala-azar* was nothing but a very intense form of malarial fever, which could be communicated from the sick to the healthy, an opinion which was to a great extent endorsed by the profession in Assam, successive Principal Medical Officers declaring that, whatever *kala-azar* was, it had been abundantly proved that it was not *anchylostomiasis*. The suggestion that malaria could be commu-

licated did not, however, commend itself to the entire medical world, and was criticised with some severity, Dr. Giles writing as recently as 1898 "—Dr. Rogers, like a medical Alexander, cuts his Gordian knot by announcing that Assamese malaria is infectious. In this he places himself at variance with not only the scientific but the popular opinion of the entire world." A complete change in popular and scientific opinion was, however, brought about by the development of Manson's mosquito theory, and Major Ross, who visited Assam, in the course of his enquiry into the manner in which infection by malaria takes place, confirmed Rogers' conclusions, and in 1899 placed on record his opinion that, as stated by Rogers, *kala-azar* was malarial fever."

Externally the chief point of difference between *kala-azar* and ordinary malarial fever lies in the rapidity with which the former produces a condition of severe cachexia, and the ease with which it can be communicated from the sick to the healthy. Recent investigations have, however, thrown some doubt on the malarial theory. Certain parasites called Leishman-Donovan bodies have been discovered in the spleens of fever patients, and it is thought possible that they may be the cause of the complaint. The origin of the disease is obviously a matter which must always be open to doubt. Captain Rogers is of opinion that *kala-azar* was imported from Rangpur, where malarial fever was extraordinarily virulent in the early seventies, but this is still a matter of conjecture. *Kala-azar* first entered Goalpara in 1883, and produced such a rise in the recorded mortality that a special establishment was entertained to move about through the affected villages and administer medical relief. The disease was most prevalent south of the Brahmaputra, and, between 1881 and 1891, the population of the Goal-

para subdivision, which includes this tract, decreased by no less than 18 per cent. It gradually burned itself out, and since 1901 the mortality from this cause has not been high.

Dysentery, diarrhœa, and other bowel complaints are also common, especially at the time when the mangoes and jack fruit ripen. Many persons suffer from worms and cutaneous disorders, and venereal diseases unfortunately seem fairly prevalent. Cases of goitre are for the most part confined to the western portion of the district. The fevers of Goalpara are generally of an intermittent type, accompanied by headache, constipation, and nausea. The spleen and liver are congested, and, after several attacks, the former organ becomes enlarged. The Eastern Duars have always been considered to be extremely unhealthy for all persons except the indigenous inhabitants, and fever is also common in the Chapaguri, Lakhipur, and Dudhnai thanas and in part of Pratapganj.

There are very few professional midwives, and a woman in her confinement is generally attended by her relatives or friends. In difficult cases they can render little help, and recourse is had to Heaven for assistance. A goat or duck is sacrificed, and *mantras* are tied round the neck and arm of the woman, or inscribed on a brass vessel which is placed where her eyes can fall upon it. In cases of false presentation attempts are made to drag the child out by anything that offers, and the abdomen is kneaded in the hope that the foetus may be expelled. In the absence of

medical aid, and this aid is seldom to be obtained, the mother in such cases generally dies. The confinement sometimes takes place in a small hut which has been specially constructed for the purpose, and the patients bed generally consists of an old mat laid on the floor. If the labour is a natural one all is well, but if complications arise the case has usually a fatal termination. It is also probable that many lives are lost owing to a disregard of the rules of cleanliness which are of such paramount importance in these cases.

Increase in
facilities for
obtaining
medical aid.

There can be little doubt that many lives are still annually lost which could be saved by proper treatment. But it is satisfactory to know that of recent years there has been a great increase in the facilities for obtaining medical aid, and in the extent to which the people avail themselves of the advantages now offered to them. From the following abstract it appears that for every patient treated in 1881 there were 12 in 1901, while the number of operations performed rose from 135 to 1,082.

Year.	No. of dispensaries	No. of patients treated.	No. of operations performed.
1881	4	5,474	135
1891	9	22,101	526
1901 (a)	18	63,747	1,072

The principal dispensaries are those situated at Dhubri, Gauripur, Manikarohar, and Goalpara, each of which

(a) Exclusive of the private dispensary at Abhayapuri.

had, in 1903, a daily average attendance ranging from 41 to 71. The diseases for which treatment is most commonly applied are malarial fevers, worms, cutaneous disorders, diseases of the eye, dysentery and diarrhoea, and rheumatic affections. The number of patients treated at each dispensary in 1900 and the succeeding years will be found in Table XXIV.

A professional revenue survey of Goalpara was made **surveys.** at the time when the district formed a part of Bengal, and maps were published in 1876. They are on the scale of one inch to the mile and in addition to topographical features, show the sites of villages and the physical features of the country. A smaller map on the scale of 4 miles to the inch was published in 1883 and brought up to date in 1893. A cadastral survey was carried out in the Eastern Duars, by local agency on the basis of a traverse by the professional survey party. The total area so surveyed between 1st October 1896 to September 30th, 1900 was 338 square miles.

TABLE
Reserved

Name of reserve.	Area in sq. miles.	Character of forest.	1900-01.	1901-02.
			Rs.	Rs.
uma ...	26	A compact block about 30 miles from Dhubri along north trunk road. The forest is almost pure sal intersected by strips of low lying and swampy ground. A few trees only are found associated with sal chiefly <i>dillenia pentagyna</i> ; <i>careya arborea</i> , <i>sterculia villosa</i> ; the low lands are gradually filling up with <i>machi-lus odoratissima</i> . The undergrowth consists mainly of <i>chrodendron infortunatum</i> ...	86,213	21,415
Ripu ...	235	Situated along the foot of the Bhutan Hills between the Sankosh and Saralbhangra rivers. Generally flat. Sal occurs on the high land between the rivers but is intersected by large areas of grass. The grass lands which have been successfully protected from fire are gradually filling up with soft woods. Khair and sisau occur along the Sankosh, Ranga, Hail, and Saralbhangra rivers ...	81,231	34,434
Kachugaon ...	66	A tract of land south of the Ripu Reserve made over to the Forest Department for the establishment of forest villages in order to supply labour for forest work. With the exception of a few sal clumps, there is no timber of value. The area was constituted a Reserved Forest to ensure complete Departmental control.	...	...

			Rs.	Rs.
Chirang	234	Situated on the east of Ripu Reserve between the Saralbhanga and the Bhur rivers. The northern portion contains a considerable area of evergreen forest which has been little exploited so far. The southern portion is stocked with sal and with the exception of swampy depressions and water courses is almost fully stocked, principally with pole growth ...	14,397	23,988
Bengtal.	23	Is connected at the north-west corner by a narrow neck with the Chirang Reserve. Contains sal in clumps with large areas of grass. The latter is, however, gradually filling up with soft woods and sal along the eastern border. The forest is generally somewhat inferior in growth ...	331	826
Bhumeswar Hill	7	An isolated hill situated south-east of Sidli. Slopes steep. Highest point is 1637 feet above M. S. L. Contains sal both pure and associated with a few other kinds but more than half is grass land or steep slopes with bare rock ...	386	215
Bijul	196	Situated at the foot of the Bhutan Hill between the Buria and Manas rivers. A large number of streams intersect the area, and generally have kbair and sissu on both banks. Simul (<i>bombax malabaricum</i>) is making rapid progress and this will probably be the dominant species in time. Large areas of grass occur between the river beds in which soft woods are gradually making their appearance. ...	...	7

PREFACE.

To those unacquainted with Assam it may perhaps seem strange that no directory should be attached to the Gazetteer of Kamrup. There are, however, only two towns in the district, Gauhati and Barpeta, and they have been described at length. One green village is very much like another green village, and none possess such distinctive characteristics as would justify a separate and detailed description. Reference has, however, been made to all villages by name, which are noted either as trade centres of importance or as the seats of some particular industry. My acknowledgments are due to Mr. Jackson, Deputy Commissioner, and Mr. Barnes, Settlement Officer of the district, who have been so good as to examine the Gazetteer in proof.

SHILLONG :

CHAPTER VII—GENERAL ADMINISTRATION.

Land revenue—Native system—Early British Settlements—The Settlement of 1893—The Settlement of 1903—Established and fluctuating cultivation—Annual and periodic leases—Settlement staff—Land tenures—Collection of land revenue—Unsettled Waste—Excise—Opium—Country spirit—Laopani—Ganja—Income tax—Stamps—Public Works—Administration of justice—Volunteering—Police—Jail—Education—Medical aspects—Surveys	.. 191 to 230
--	---------------

CHAPTER I.

PHYSICAL ASPECTS.

Area—General appearance of district—Hills—Rivers—Marshes—
Geology—Climate and rainfall—Earthquakes—Fauna.

The district of Kamrup lies between $25^{\circ} 43'$ and $26^{\circ} 53'$ N. and $90^{\circ} 39'$ and $92^{\circ} 11'$ E. and covers an area of 3,858 square miles. On the north it is bounded by Bhutan, on the east by the districts of Darrang and Nowgong, on the south by the Khasi Hills, and on the west by Goalpara. **Area and boundaries.**

The greater part of Kamrup consists of a wide plain, through the lower portion of which the Brahmaputra makes its way, flowing a steady course from east to west. South of the river this plain is much broken up by hills. The two Chamaria mauzas are low swampy tracts, but below the trunk road there is hilly, almost mountainous, country; and near the southern frontier of the district there are peaks over 3,000 feet in height. These peaks form an integral part of the Assam range, but, east of Palasbari, isolated hills crop up above the alluvium, and at Gauhati reach right down to the water's edge. They even appear on the north bank of the Brahmaputra; and in the Patidarang tahsil, south of Kamalpur, and in the Hajo tahsil, east of Hajo, there are several hills, some of which are as much as 1,000 feet in height. **Kamrup, a plain with mountains in the south.**

The flooded tracts near the river.

North of the river the plain falls roughly into three sections. In places, and more especially in the neighbourhood of Gauhati, the river flows between high banks, which are only overtopped by a heavy flood. In the western part of the district a belt of marshy country, which is subject to inundation in the rains, lies on either side of the cold weather channel. The soil of this flooded tract is composed of a mixture of sand and silt, which in its natural state is covered by a dense growth of *nal*, *ikra*, *tora pat*, and other reeds and grasses. This jungle is absolutely impenetrable to a man on foot, unless he gropes his way along the tunnels that have been made through it by the buffaloes that are occasionally to be found in this locality; but from time to time patches of it are cleared and burnt, and are sown with summer rice or mustard. These fields afford a pleasant change to the interminable waste of reeds and grasses. They are surrounded by a thick wall of jungle, and generally contain a few huts, in which the husbandmen take up their quarters during the cold weather.

The central plain and the Kachari duars.

The central portion of the district is a densely populated plain, covered as far as the eye can reach with fields of waving rice, and dotted over with the groves of graceful bamboos which conceal the houses of the cultivators. The land is beyond the reach of flood; there is little of marsh or forest, and nothing to interfere with the operations of the farmer. This densely populated tract does not, however, stretch right up to the Bhutan Hills. The Gohain Kamala Ali is said to have been laid down

by the great Koch king, Nar Narayan, as the boundary beyond which the Kacharis should be allowed to practice their ancestral rites; and the country between the Gohain Kamala Ali and Bhutan is still to a great extent Kachari territory.

Hindus are very reluctant to settle there, as they think, and rightly so, that this part of the district is far from healthy for any one but the Kachari. The causes of this unhealthiness are not quite clear, but, according to the Hindus, are to be found in the fact that the evil spirits who haunt the place can only be properly appeased by the Kachari Pujas. It is possible, too, that a dread of Bhutia aggressions may still linger on, and it is certain that, on social grounds, the Assamese Hindu would be very reluctant to make his home amongst unconverted tribesmen. But, whatever it may be to the Hindu, to the European officer in the winter this country is far from unattractive. The level of the plain rises as it approaches the hills, and the light and sandy soil is covered with short turf or patches of *ulu* and thatching grass. The Kachari hamlets are dotted here and there over these grassy commons, each surrounded with a bank and fence, and differing in this respect from the straggling villages of the Assamese. They stand up boldly against the sky line, and, as pigs and poultry are not compatible with gardens, there is none of that wealth of fruit trees which surround the houses of the villagers in the central portion of the district. Rice is grown in fields which are irrigated from the numerous streams that issue from the hills, and in the winter the ground is bright and the

air fragrant with mustard. The mountains rise like a rampart on the north, and there is nothing in these fresh and breezy uplands to suggest that they are in any way inimical to human life.

**The country
on the south
bank.**

South of the Brahmaputra the scenery could not fail to charm every lover of the picturesque. Valleys of waving rice run up between hills which rise abruptly from the plain. The sides of these hills are steep, almost precipitous, but, wherever they can find a foothold, huge trees have thrust their gnarled roots amongst the rocks, and the hill is covered with forest interspersed with bamboos and the beautiful foliage of the creeping cane. There is none of that dreary expanse of plain which in other parts of India grows so tedious. The hills are never out of sight, and even the plain is picturesque enough, as it is much broken up by forest, swamps, and *bils*.

Mountains.

Except to the south of Dewangiri, where the boundary was pushed forward into the hills after the Bhutan war of 1863, no portion of the Himalayas falls within the district, and the mountain system of Kamrup consists of a section of the Assam range, and of a few outlying hills which crop up above the alluvium on both sides of the river. The fringe of the Assam range consists of ridge upon ridge of hills, all of them covered with dense tree forest and bamboo jungle, which gradually sink from peaks, two or three thousand feet above the level of the sea, to hillocks, whose tops are barely as many hundred feet above the flat alluvial plain. But, in addition to

these mountain ranges, isolated peaks and ridges are to be seen dotted about the plain south of the Brahmaputra, more especially in the Gauhati tahsil.

Many of these hills are thought to be sacred to various members of the Hindu pantheon. In the Chamaria mauzas there is the Buragohain parbat, which is said to be particularly dear to Siva, to whose honour a temple has been erected at its foot. The Gumi hill, so the local folklore goes, was the haunt of a pair of cobras who troubled the people in the days of Sib Singh. A party of soldiers was deputed to destroy them, but though they succeeded in despatching the female cobra (*gumi*), the male escaped to Dalgoma in Goalpara. In Chaygaon there is another Buragohain hill sacred to Siva, and a hill called Gobardhan, which is consecrated to Vishnu. In Boko there is a hill sacred to Parvati, which also bears the almost generic title Buragohain, and has a temple to the goddess on its summit; and in Luki and Bekeli, to the west, there are several holy hills such as Thakurpara, Tiniboini, Buragohain, Chilali, Borua, and Chamua. Sacred Hills.

In Palasbari the Dakhola hill is consecrated by the presence of a lingum, and the Maliata hill is sacred to the goddess Bagheswari. In the Gauhati tahsil the Dhomara hill is said to be dear to Durga, while the famous hill of Nilachal, a little to the west of Gauhati, is supposed to contain no less interesting a relic than Sati's organs of generation, which fell on that spot when her body was hewn in pieces by Vishnu. The

place has in consequence been an object of pilgrimage to many generations of Hindus, and its beautiful summit is dotted over with temples. In the Hajo tahsil there are several hills of mythological importance. The hill at Hajo itself, which is known as Kedar, or Kameswar, contains a temple which is an object of reverence to Buddhists and Hindus alike, while Siddheswar and Sanpara are dedicated to Siva. The large hill behind the Hajo bungalow is known as Poa Mecca and is revered by Muhammadans, and two small hills close by, called Duni and Muni, are said to have been hallowed by the presence of two famous Rishis. Another hill in this tahsil, which is visible for many miles to travellers coming up the Brahmaputra, is called the Hathimura, on account of its likeness to a kneeling elephant. In Patidarang there are several small ranges which shut in Gauhati on the north, and two of them, Madan Kamdev and Gopeswar, are sacred to the gods whose names they bear.

**General
appearance
of hills.**

Most of these hills are some seven or eight hundred feet in height. Their sides are steep and rocky, and they are as a rule clothed in dense tropical jungle, the outlines of the trees being softened and concealed by the dense veil of creepers which binds them into one harmonious mass of green. On some of them are to be found clumps of sal (*shorea robusta*), and here the vegetation is more sparse, as shrubs and brushwood do not thrive in a sal forest. A few of these hills have been planted out with tea, but the slopes were in many cases so steep that the soil was washed away from the roots of the

bushes, and the gardens did not thrive. In the outer ridges of the Assam range Khasis and Garos sometimes raise lac, chillies, betelnut, and vegetables, but the hills as a whole are too steep and unhealthy to be really of much use for agricultural purposes; and, though they would supply good building stone, the demand for that commodity since the earthquake of 1897 has been very limited.

The principal river of Kamrup is the Brahmaputra, **Rivers.** which flows right through the district from east to west. **The Brahma-putra.** At Gauhati it is confined between rocks and hills in a comparatively narrow channel, but even here the breadth of the telegraph wire across the river, measured from post to post, is 1·45 of a mile. Lower down the river spreads itself during the rains over the marshy country on either hand, and, when in flood, the distance from one high bank to the other is very great. It oscillates from side to side of the sandy strath through which it makes its way, its waters are surcharged with matter in suspension, and a snag or other impediment in its course will occasionally give rise to a huge *chur*. These *churs* are sometimes washed away by the next flood, sometimes remain for several years till they have developed into islands covered with reeds and jungle grass. The operations of alluvium and diluvium are continually being carried on on a gigantic scale, islands are formed and destroyed in a single season, new channels are opened and after a time are silted up. But year in year out the Brahmaputra carries down a huge volume of water, and somewhere on its

mighty bosom it is always possible to find a channel for the river steamers.

The Kulsi.

The principal tributary on the south bank is the Kulsi, which enters the district from the Khasi Hills, and flows a northerly course to a point a little beyond Chaygaon. Here it turns west, and, after winding its way through the Chamaria mauzas, falls into the Brahmaputra near the Nagarbera hill. Up to Chaygaon its course lies for the most part through forest clad hills, for whose timber it affords an outlet, but north of the trunk road it passes by villages, *bils*, and stretches of reeds and canes. During the cold weather a boat of four tons burthen can only proceed as far as Kukurmara, but in the rains can get right up the frontier of the district.

**The Digru
and Juljulia.**

After the Kulsi, the Digru and the Juljulia are the two most important rivers in Kamrup which fall into the Brahmaputra from the south. The Digru enters the district at Barnihat, where the Shillong-Gauhati road crosses it on a large bridge, flows a north-easterly course to Sonapur, and then turns north to fall into the Kalang, a short distance below the confluence of that river with the Brahmaputra. It is navigable by a boat of four tons burthen as far as Barnihat at all seasons of the year, and affords an outlet to the cotton grown in the lower hills. The western end of the district is drained by the Juljulia, which falls into the Brahmaputra west of the Nagarbera hill. In addition to these main rivers there are numerous other minor streams, but none of them are of very much importance.

North of the Brahmaputra the two great rivers are **The Manas.** the Manas and the Barnadi. They originally formed the boundaries of Kamrup to the west and east; originally, because, like so many of the rivers in Assam, they have more than once changed their courses and wandered away from their former channels. The Manas enters the district from the Bhutan Hills, and at a place called Matharguri divides into two branches. The Jia Manas, which is the main stream, flows for a considerable distance through Goalpara, but near its mouth again forms the boundary between the two districts. For the greater part of its course the river flows through jungle, as its repeated divagations render it impossible for permanent villages to be established on its banks. It is thus but little used as a trade route above its confluence with the Chaulkhoa, though a boat of four tons burthen can proceed as far as Bogidara even in the dry season.

The Barnadi, like the Manas, rises in the Bhutan Hills, **The Barnadi.** and also follows its evil example of changing its channel from time to time, so that it no longer invariably forms the boundary between Kamrup and Darrang. During the first portion of its course through the plains it flows through tree and grass jungle. Lower down, villages appear upon its banks, though it is only where the channel is fairly permanent that the people care to build their homesteads near the river. It is of considerable value as a trade route, boats of four tons burthen being able to proceed as far as Sonarikhal in the cold weather,

and right up to Malmura Ghat in the rains, and it thus affords an outlet to the rice, mustard, and pulse grown in the interior.

The Chaulkhoa and Pagladiya.

There are numerous other rivers that issue from the Bhutan Hills, but most of them are small and unimportant. Between the Barnadi and the Manas there is a complicated network of shallow streams, which meander over the plain and ultimately find their way into the Brahmaputra, most of them being first collected either in the Hajo Suta or the Chaulkhoa. The latter river flows past Nalbari and Barpeta, and falls into the Manas a little above its confluence with the Brahmaputra. Prior to the great earthquake it was a most valuable trade route into the interior, but during that fearful cataclysm of nature the bed of the river was raised, and, for a time at any rate, traffic was rendered very difficult. Boats can, however, still go up to Nalbari, which is one of the largest markets in Kamrup. The Pagladiya is a river which, as its name implies, has been a continual source of trouble. It rises in the Bhutan Hills and ultimately finds its way into the Chaulkhoa, but it seldom remains long in the same bed, and in the course of its vagaries it has more than once converted valuable rice fields into swamp, or, what is even worse, a stretch of arid sand. During the rains it is navigable by boats of four tons burthen as far as Alagjhar.

Other rivers.

Other rivers, which are utilized for the purposes of trade, are (1) the Puthimari, which falls into the Barnadi, and is navigable throughout the year as far

as Tamulpur; (2) the Baralia, up which a boat of four tons burthen can go, even in the cold weather, for twenty-five miles above its junction with the Chaulkhoa; (3) the Kalajal, which flows west of Kamalpur into the Hajo Suta; (4) the Sessa, which is a tributary of the preceding river; (5) the Kaldiya, which passes through Patharcharkuchi and falls into the Chaulkhoa; and (6) the Pohumara, which flows through Bijni and makes its way into the same main drainage channel.

Nearly all of these rivers flow on sandy beds along shallow channels, and as a natural result they not unfrequently shift their courses. Many of them, when they first debouch upon the plain, vanish into the earth, and only re-appear again at some little distance from the hills. The soil in north Kamrup is light and gravelly, and the drainage of the Himalayas is dissipated in a number of minor streams instead of being concentrated into two or three fine rivers flowing between fixed banks. This shifting of the river courses and dissemination of the drainage is a phenomenon which is seen to some extent in Goalpara and Mangaldai, but in no district is it found in so pronounced a form as in Kamrup. So ready, in fact, is the water to change its course that one river, the Dekadong, was originally nothing more than a small irrigation channel through which the Kachari villagers conveyed the water to their fields. It started as a little stream a few feet wide, but it has gradually increased in size till it is now a navigable river in the rains.

There are numerous *bils* and marshes in Gauhati, but no lakes of any considerable size. These *bils* are

General
characteris-
tics of river.

Bils and
Marshes.

generally shallow sheets of water which collect in the centre of a saucer-like basin. The level of a plain on which transplanted rice is grown must of necessity be very low, and a slight additional depression will admit of the retention of water throughout the year. Near the Brahmaputra these *bils* are generally surrounded by a rich belt of pasture land, and are shut in by a wall of elephant grass and reeds. In the higher country near the hills they are sometimes deep ponds, whose length is out of all proportion to their breadth, and are simply the remains of some river which has changed its channel. There are altogether 56 *bils* in the sadr subdivision which are large enough to be sold as fisheries, and 55 in Barpeta. One of the largest and best known of all is the Dhipor *bil*, about six miles west of Gauhati. It lies at the foot of the lower ranges of the Khasi Hills, and is a sufficiently pretty and picturesque piece of water. Other important *bils* are the Jahna, the Kukurmara, and the Tanparia in the south-west corner of the Barpeta subdivision, the Katakoli in Barpeta, the Asuchi in Upar Barbhag, and the Barbila in Hajo.

Geology.

The hills are for the most part formed of gneissic rocks from which excellent building stone could be obtained. The plain is of alluvial origin, and consists of sand and clay in varying proportions, ranging from pure sand near the banks of the Brahmaputra to a blue clay so stiff as to be utterly unfit for cultivation. Surface lime was discovered at the foot of the Bhutan Hills in 1871 by the Assistant Commissioner of Barpeta. It is of a superior description, but it is believed not to extend over a wide area.

The climate of Kamrup does not differ materially from **Climate** that of the other districts of Central Assam. Its principal characteristics are a cold and foggy winter, a moderately cool spring, and a fairly temperate but very humid summer. January is the coldest month in the year with an average maximum temperature of 73° and an average minimum of 49° . In March and April the weather begins to grow a little warm, warm, that is to say, in comparison with Dibrugarh, where the average maximum in April is less than 80° , but cool enough in comparison with Upper India. From April to October the average maximum is never less than 87° , and in July it is as high as 91° . During the height of the rains the climate is decidedly oppressive. The air is absolutely saturated with moisture, and the damp heat is trying alike to natives and to Europeans. The average maximum and minimum temperature in each month will be found in Table I.

In the central portion of Kamrup the rainfall is, for **Rainfall** Assam, comparatively low. At Gauhati it is only 67 inches in the year, and at Kamalpur but 65. But, as we approach the hills on either side of the valley, the rainfall gradually increases, and at Barduar to the south it is 89 inches, while at Tamulpur to the north it is 85. Barpeta lying towards the west is even wetter, and has an average fall of 96 inches in the year. From the beginning of November to the end of February there is very little rain, but towards the end of March there are heavy showers. The hot dry weather of Upper India is completely absent, and in April and May the rainfall is so

heavy that it might easily be imagined that the monsoon had broken. No less than 15 inches of rain fall at Barpeta in May, a quantity which actually exceeds the rainfall of August and September. In October the rains begin to stop, and November is one of the driest months in the year. Statistics of rainfall will be found in Table II.

**Storms and
floods.**

Kamrup is seldom visited by violent and destructive storms, though an interval of dry weather in the rains is often closed by a thunder shower, which at once relieves the oppressiveness of the atmosphere, and is thus extremely welcome. In March there are often hot unpleasant winds from the west, which in the neighbourhood of the Brahmaputra raise up clouds of sand. The country lying on either side of the river is exposed to injury from floods, which were particularly severe after the earthquake of 1897 had disturbed the levels and silted up the drainage channels. This subject is discussed at greater length in the chapter dealing with the agricultural conditions of the district.

**The earth-
quake of
1897.**

Kamrup, like the rest of Assam, has always been liable to earthquakes, but all previous disturbances of which there is any record were as nothing in comparison with the terrible cataclysm of 1897. This earthquake was felt over an area of 1,750,000 square miles, from Rangoon on the south-east to Kangra on the north-west, from the Himalayas to Masulipatam, and serious damage was done to masonry buildings over an area of 145,000 square miles.* The area of maximum disturbance was a tract of country of the shape of a cocked

* Memoirs of the Geological Survey of India, Vol. XXIX, p. 52.

hat, whose base line ran from Rangpur to Jaintiapur, while the top of the crown was near Barpeta. The shock occurred in Gauhati a little after 5. P. M. on June 12th, and was so violent that nearly every masonry building in the town was wrecked. All the public offices collapsed, with the exception of the post and telegraph office, the training school, and the dāk bungalow; and the European residents were rendered homeless. The wall surrounding the jail premises was thrown down, but, strangely enough, the wards, though they are erected on high pillars, were not injured. The roads began to crack as ice breaks up on the setting in of a thaw, and the water-supply of the town was thrown completely out of gear. The houses of the villagers, which are made of bamboos and reeds, were not as a rule thrown down, but in many parts of the district the fields were covered with water or deposits of sand. The ordinary drainage channels were choked, the beds of the rivers were raised, and the town of Barpeta, which was built upon comparatively low ground, was at once submerged. The Subdivisional Officer was compelled to take up his residence in a country boat, and it was in these uncomfortable vessels that public business had to be transacted, and even the prisoners lodged. Country boats became, in fact, the cutcherry, the treasury, and the Barpeta jail. The actual loss of life was comparatively small and only 29 deaths were directly attributed to the earthquake. But the damage done to cultivation was considerable, owing to the choking up of drainage channels and the disturbance of the levels of the country.

Fauna.

Wild animals include elephants, rhinoceros, bison (*bos gaurus*), buffalo, tigers, leopards, bears, wild pig, and different kinds of deer, of which the principal varieties are the *barasingha* or swamp deer (*cervus duvauceli*), the sambar (*cervus unicolor*), the hog deer (*cervus porcinus*), the spotted deer (*cervus axis*) and the barking deer (*cervulus muntjac*). Elephants are fairly common, especially near the hills, and when the crops are ripening do much damage unless the numbers of the herds are regularly kept down. For this purpose the district is divided into three mahals or tracts. The right to hunt in each mahal is sold by auction, and the lessee is required to pay a royalty of Rs 100 on every animal captured. The method usually employed is that known as *mela shikar*. Mahouts mounted on staunch and well trained elephants pursue the herd, which generally takes to flight. The chase is of a most arduous and exciting character. The great animals go crushing through the thickest jungle and over rough and treacherous ground at a surprising pace, and the hunter is liable to be torn by the beautiful but thorny cane brake, or, were he not very agile, to be swept from his seat by the boughs of an overhanging tree. After a time the younger animals begin to flag and lag behind, and it is then that the opportunity of the pursuer comes. Two hunters single out a likely beast, drive their elephants on either side, and deftly throw a noose over its neck. The two ends of the noose are firmly fastened to the *kunkis*, as the hunting elephants are called, and, as they close in on either side, the captured animal is unable to escape, or to do much injury to his captors, who are generally

considerably larger than their victim. The wild elephant is then brought back to camp, where it is tied up for a time and gradually tamed. Fourteen animals were caught in 1899-1900, the last year in which the mahals were sold by the Deputy Commissioner.

Rhinoceros live in the swamps that fringe the Brahmaputra and the Manas, and in the sparsely populated tracts in the north-west corner of the district, but they are now becoming very scarce. They breed slowly, and, as the horn is worth more than its weight in silver, and the flesh is prized as food, they present a tempting mark to the native hunter. Steps have recently been taken to preserve the game in a tract of jungle land, about 90 square miles in area, in the northern part of the Bijni mauza. Herds of wild buffalo are found in the same locality, and wild bulls often serve the tame cows that are kept by the Nepalese on the Brahmaputra *churs*. Bison are generally found near the hills and in the neighbourhood of tree forest; tigers, leopards, and bears are met with in almost every part of the district. Wild animals cause little loss of human life, but in 1903 are said to have accounted for nearly four thousand head of cattle. The number of human beings killed in that year by different animals was as follows:—Elephants 4, tigers 8, bears 2, wild buffaloes 3, wild pigs 2, snakes 29, total 48. Rewards were at the same time paid for the destruction of 86 tigers, 146 leopards, and 23 bears. Small game include wild geese and duck, snipe, florican (*syphæotis bengalensis*), black and marsh partridge, pheasants and hares. Peacocks are also occasionally seen in the north of the district.

Other
animals.

CHAPTER II.

HISTORY.

Summary—Narak and legendary history—Visit of Hiuen Tsiang—Kamrup in the 11th century A. D.—The Koch Kings—Struggle between Muhammadans and Ahoms—Muhammadan invasions—The Ahom Kings—The Moamaria insurrection—Annexation of Assam by the British—Ahom government and social life—Buchanan Hamilton's description of Kamrup—Unhealthiness of Gauhati—The Bhutan war—Riots in 1893—Archæological remains—Chronological Table.

Summary.

The district of Kamrup originally formed part of the kingdom of Kamarupa, which at one time is said to have included part of North-Eastern Bengal and the whole of the valley of the Brahmaputra. Narak's name is still remembered as one of the first protectors of Kamakhya, and his son Bhagadatta is said to have fought on the losing side in the great war of the Mahabharata. For many centuries the history of the district is involved in great obscurity. It seems probable that the line of Narak was displaced by a Bodo chief, who was subsequently driven eastwards to the valley of the Dhansiri, but in the eleventh century A. D. it seems clear that Kamrup was included in the territories of a powerful and civilized line of Pala kings. In the sixteenth century Kamrup passed into the possession of the Koch kings. The power of this dynasty declined, however, as rapidly as it rose, and in the seventeenth

century the district was the scene of continual conflicts between the Muhammadans and the Ahoms. In the short space of fifty years Gauhati was taken and retaken no less than eight times, but towards the end of the seventeenth century Kamrup was definitely incorporated in the territory of the Ahom Rajas. From that time onward the district formed part of their kingdom in name, though not always in fact, till in 1826 it passed into the possession of the British by the treaty of Yandaboo.

According to the *Yogini Tantra*, the kingdom of <sup>The king-
dom of
Kamarupa,
1200 B. C.—
1000 A. D.</sup> Kamarupa extended from the Karatoya river on the western boundaries of Rangpur to the Dikrai in the east of the Darrang district. It was divided into four portions, *i. e.*, Kamapith from the Karatoya to the Sankosh, Ratnapith from the Sankosh to the Rupahi, Suvarnapith from the Rupahi to the Bhareli, and Sau-mar-pith from the Bhareli to the Dikrai. The earliest king of Kamarupa of whom anything in particular is recorded is Narak, who is said to have been the son of the Earth by Vishnu, and who defeated and slew his predecessor Ghatak.* He established his capital at Prag-jyotishpura, the modern Gauhati, and seems to have been a powerful and prosperous, though somewhat headstrong prince. He was appointed the guardian of Kamakhya, and his name still lives amongst the people as the builder of the causeway up the southern face of the hill Nilachal, on which the temple of Kamakhya

* An account of the early kings of Kamarupa will be found in the Koch Kings of Kamarupa by Mr. E. A. Gait, C. S., published in J. A. S. B. Vol. LXII, Part I, No. 4, 1893.

stands. His power and presumption were such that he asked Kamakhya to marry him, and the goddess consented, on the understanding that he would construct for her a temple, a road, and a tank in a single night. He was on the point of completing this task when Kamakhya made a cock crow before the usual hour, and the place about eight miles north of Gauhati, * at which Narak in his rage killed the cock, is still known as Kukurakata (the place where the cock was killed). He was succeeded by his son Bhagadatta, who is mentioned in the Mahabharata as fighting on the side of the Kauravas at the great battle of Kurukshetra, and we thus seem justified in assuming that fully a thousand years before Christ Kamrup formed part of a powerful kingdom ruled by a line of non-Aryan princes.

The copper plates of the eleventh century.

Further information with regard to the rulers of Kamarupa is given in certain copper plates, which on palæographical grounds have been assigned to the eleventh century A. D. † These plates are valuable evidence as to the state of the country at the time at which they were engraved, but their account of the genealogy of the reigning king must obviously be received with some degree of caution. The dynasty of Narak is said to have been displaced by Cala Stambha, a Mleccha or foreign conqueror, whose line ended in the person of Sri Harisa, and was succeeded by another family of foreign princes, the first of whom was Pralambha and

* A hill near Silghat is also called Kukurakata for the same cause.

† For a description of these plates see J. A. S. B., Vol. LXVI, pp. 113 and 285, and Vol. LXVII, part I, No. 1, p. 99.

the last Tyaga Singh. The dynasty of Narak was then restored in the person of Brahmapala. The invasion of the Mlecchas and their subsequent expulsion not improbably corresponds with the great irruption of the Bodos, who, according to their own traditions, were at one time ruling at Gauhati and were subsequently driven eastwards to Dimapur, but the whole of this period is involved in great obscurity.

In 640 A. D. Hiuen Tsiang visited Assam, and the record of his travels affords a momentary glimpse of the conditions of the country, a glimpse which is not unlike the view afforded by a flash of lightning on a dark and stormy night. The landscape, which has been shrouded in impenetrable gloom, is suddenly disclosed to view, and with equal rapidity is engulfed again in the blackest darkness; and nothing definite is known of the fortunes of Assam and its inhabitants either immediately before or after the visit of the great Chinese traveller. The country seems to have advanced some distance on the path of civilization. The soil was deep and fertile, the towns surrounded by moats, the people fierce in appearance but upright and studious. Hinduism was the national religion, and, though Buddhism was not prohibited, its milder tenets had comparatively few followers.

The evidence afforded by the copper plates which have been discovered in Kamrup, Nowgong, and Darrang suggests that the Pala kings, who reigned over Kamarupa in the eleventh century A. D., were powerful princes, who, in all that makes for material comfort and well-being,

*The visit of
Hiuen
Tsiang, 640
A. D.*

*Kamrup in
the eleventh
century A. D.*

were far in advance of the Assamese of the present day. They were lords of Pragjyotisha, the modern Gauhati, but seem to have resided at Durjaya, which in all probability occupied the site on which the station of Tezpur now stands. Their capital is described by the author of the grant in the most glowing terms. It was crowded with soldiers and merchants, and adorned with learned men, priests, and poets. A thousand plastered turrets hid the sun, and the strength of its ramparts were a source of mortification, or, as the inscription quaintly puts it, "pulmonary consumption," to various other mighty chiefs. The king studded the earth with his white-washed temples and the pillar monuments of his victories. He was evidently no mere local princeling, as he obtained great wealth from his copper mines; and there are no copper mines in the neighbourhood of Gauhati or Tezpur. Considerable allowance has to be made for the exuberance of the oriental imagination, but the precise injunctions issued to the "people of the Brahman and other castes, headed by the *district revenue officers and their clerks*," with regard to the actual grant of land, suggest a systematic and well organised government. Similar conclusions are to be drawn from the following description of the land itself and of its easements. "Be it known to you, that this land, together with its houses, paddy fields, dry land, water, cattle pastures, refuse lands, etc., of whatever kind it may be, inclusive of any place within its borders, and freed from all nuisances on account of the fastening of elephants, the fastening of boats, the searching for thieves, the inflicting of punishments, the

tenants' taxes, the imposts of various causes, and the pasturing of animals, such as elephants, horses, camels, cattle, buffaloes, goats, and sheep, as set forth in this charter, is given to him for the sake of God and the glory of my father and myself."

Brahmapala, in whose person the line of Narak was restored, was succeeded by his son Ratnapala, whose sceptre devolved not on his son but on his grandson Indrapala. Of the subsequent fate of these Pala kings we know but little, but it is clear that in the eleventh century A. D. Lower and Central Assam formed part of a civilized and powerful kingdom, which had reached that stage of development in which attention can be paid to the arts and amenities of life. The huge tanks in the neighbourhood of Gauhati and the bricks and mortar found in every direction beneath the soil show that it must once have been a place of very great importance. To the south there are the remains of ramparts * nearly four miles distant from the river's bank, and it is obvious that such an extended line of fortifications could only have been held by a large army. The contrast between the glories of the old Gauhati and the dead level of mediocrity, which is the distinguishing feature of the district at the present day, is very marked.

After the disappearance of the Palas, the next dynasty, of whom we have any certain record, is that of

The Koch
kings. Viswa
Singh, 1500 -
1534.

* The date of the construction of these ramparts is uncertain, but it is on record that Arjun the Buragohain made a wall round Gauhati in 1667 A. D.

the Koches, and here we reach the region of history and not of mere tradition and hypothesis.*

The founder of the Koch kingdom was a Mech named Viswa Singh, who is said to have been the son of Hira, the wife of one Haria Mandal, by Siva, who assumed the shape of her husband, and thus induced her to admit him to her embraces. Viswa Singh subdued the petty princes who surrounded him, founded a magnificent city in Kuch Bihar, and reduced his state to order. The whole population was divided up into different corps under officers of increasing dignity, a thakuria being appointed over every 20 coolies, a saikia over every 100, a hazari over 1,000, an umra over 3,000 and a nawab over 66,000. He took a census of his subjects and found that the number capable of bearing arms was 5,225,000, a figure which suggests that an extra cypher must in some way have crept into the total reported to the king. He is said to have marched against the Ahoms, but to have abandoned the expedition owing to the collapse of his commissariat; but the Ahom version, which states that he was defeated and made tributary, seems a more probable explanation of the failure of the expedition. Another exploit credited to this prince is the re-discovery of Kamakhya. He visited the hill Nilachal, where he was shown a mound which was said to contain a deity. The prayers he offered were at once granted, and he accordingly had the mound explored, when the ruins of the old temple at once came to light. A new

* This account of the Koches has for the most part been taken from an interesting paper on the Koch kings of Kamarupa by Mr. E. A. Gait, C. S., published in J. A. S. B., Vol LXII. Part I, No. 4, 1893.

temple was then erected, a gold coin placed between each brick, and Brahmans brought from Kanouj and other places to perform the sacred rites.

Viswa Singh died after a reign of 25 years, and was succeeded in 1534 A. D. by his son Malla Deva, who assumed the name of Nar Narayan. The reign of this prince represents the zenith of the Koch power, and his armies, which were led by his brother Sukladwaj or Silarai, met with almost unvarying success. He first attacked the Ahoms, but, mindful of his father's failure, commenced his operations by building a great military road along the north bank of the Brahmaputra, and constructing tanks at regular intervals along it. The work was entrusted to his brother Gohain Kamala, and the road, much of which is still in existence, bears the name of Gohain Kamala Ali to the present day. Nar Narayan entered the Ahom capital Gargaon (the modern Nazira), and did not leave till he had received the submission of the Ahom king. The Kachari Raja and the Raja of Manipur were then reduced to the position of feudatory chiefs, and the kings of Jaintia, Tippera, and Sylhet conquered and slain. Further successes were obtained over the rulers of Khairam and Dimuria, but the tide of fortune turned when an attack was made on the kingdom of Gaur. The Koch army was routed and Silarai himself made prisoner. Nar Narayan would not, however, accept this defeat as final, and a few years later joined with the Emperor Akbar in a second attack upon the Pasha of Gaur. This enterprise was crowned with success, and Gaur was divided between the Emperor

Nar Narayan, 1534—1584 A. D.

of Delhi and the Koch king. Shortly before this expedition Nar Narayan had restored the famous temple at Kamakhya, which had been injured by the Muhammadan invader Kala Pahar in 1553 A.D.

**Decline of
Koch king-
dom. Raghu
Rai, 1581 -
1593 A. D.**

Within the space of two generations the Koch kingdom had attained to an extraordinary height of prosperity and power, but its decline and fall were as rapid as its rise. For a long time Nar Narayan had no male offspring, and Silarai's son, Raghu Rai, was regarded as his heir. When this boy was approaching manhood, one of his uncle's wives gave birth to a son called Lakshmi Narayan, and Raghu Rai, realising that he had now no hope of succeeding to the throne, withdrew from the capital to Barnagar in the Barpeta subdivision of Kamrup. Nar Narayan endeavoured to compel him to return, but his soldiers were defeated and the king weakly resolved to divide his kingdom.* The territory east of the Sankosh was made over to Raghu Rai, while Lakshmi Narayan received the part that lay west of that river. Raghu Rai continued to reside at Barnagar, and seems to have been much devoted to religious exercises. In 1583 A.D. he restored the temple of Hajo in Kamrup, which had been injured by Kala Pahar, and endowed it with grants of land.

**Parikshit,
1593-1614
A. D.**

Raghu Rai was succeeded by his son Parikshit in 1593 A.D. This prince mounted cannon at Pandunath, to the

* According to Buchanan Hamilton, the kingdom was founded by Hajo, father of Hira and grandfather of Viswa Singh, and divided by Viswa Singh, who allotted the portion east of the Sankosh to Sukladwaj or Silarai, and that west of the river to Nar Narayan. On general grounds, however, this account seems to be less probable than that given in the body of the text.

west of the Kamakhya hill, and built a town at North Gauhati, whose fortifications can still be traced for many miles even at the present day. He then had the misfortune to provoke the cupidity of the Muhammadans, who determined to annex Koch Hajo, as Parikshit's dominions were called, as they had already succeeded in establishing their suzerainty over Lakshmi Narayan's kingdom of Kuch Bihar.* A strong force was sent up the valley under Mukarram Khan. Fort Dhubri was garrisoned by an army of 500 horse and 10,000 foot, but it was captured after a four weeks' siege; and a naval engagement, which took place in the Gangadhar river, was equally disastrous to the Koch king. Parikshit was driven across the Manas into Kamrup, and there surrendered to the enemy, but his brother Baldeo declined to abandon the unequal struggle and fled to the Ahoms for assistance.

Of the military prowess of these people the Musalmans themselves bear ample testimony, and for a time, at any rate, Baldeo met with a considerable measure of success. The Assamese fleet defeated the Muhammadans in a naval engagement on the Brahmaputra, and Hajo was besieged and taken. Emboldened by these victories Baldeo and his army advanced to Jogighopa, but here they were defeated and were forced to retire, first upon Budhnagar, and then to a place called Chothri near the foot of the hills. A pitched battle took place at Bishenpur in which the Assamese were defeated with great loss, and the Muhammadans then marched upon the forts at Pandu

Conflict between
Ahoms and
Muhammadans.

* An interesting account of the wars between the Muhammadans and Ahoms will be found in J. A. S. B., Vol. XLI, Part I, No. 1, 1872.

and Srighat on either side of the river near Gauhati. The Assamese fleet was defeated and dispersed, the forts taken, the post at Kajli near the confluence of the Kalang and the Brahmaputra captured, and by the beginning of 1638 A.D. the Ahoms had been driven out of Kamrup, and Gauhati had become the capital of the Moslem governor. But it was not for long that the Muhammadans remained in possession of their newly conquered territory. In 1658 Jaiyadwaj Singh took advantage of the disputes amongst the claimants to the throne of Shah Jehan, and marching down the valley of the Brahmaputra drove the Moslems and his former allies the Koches alike before him. An Ahom outpost was established at Hatsilah, and the Assamese annexed a portion of the Karaibari pargana in the Goalpara district.

**Mir Jumla
invades
Assam in
1662 A. D.**

The new subadar of Bengal was not, however, the man to brook this unprovoked aggression, for, though the Muhammadans had but little title to Kamrup, the Ahoms had still less, and in 1662 Mir Jumla led a powerful expedition to the conquest of the Assam Valley. The Ahoms had erected a strong fort at Jogighopa, defended by moats and holes which were thickly studded with bamboo spikes, but, on the approach of the Muhammadans, they fled without striking a blow. No resistance was offered in Kamrup. Gauhati, which at that time was situated on the north bank of the Brahmaputra, was occupied without the loss of a single man, and no attempt was made to hold the forts at Srighat, Pandu, and Kajli. A Muhammadan faujdar was left as governor of Gauhati, and the army proceeded on its way up the valley to the conquest

of Gargaon. The difficulties experienced during the march arose more from the nature of the country than from the obstinacy or enterprise of their opponents. The Ahoms continued to pursue their Parthian tactics ; they seldom offered open resistance to the invading force, and when they did so met with no success, and on the 17th March 1662 the Nawab entered Gargaon.

The history of the expedition is not unlike that of Napoleon's ill-fated irruption into the territories of the Czar, and rain and fever did for the Ahoms what frost and snow did for the Russian Emperor. When the rains broke the country was converted into one huge swamp and military operations were impossible. The invaders were shut up in their camp, and any stragglers who dared to venture out were promptly shot by Assamese who were lying in wait on every side. Sickiness began to break out amongst the soldiers, and, though there was abundance of rice, all other provisions were extremely scarce, salt being sold for as much as Rs. 30 per seer. With the commencement of the cold weather the Muhammadans were again enabled to resume offensive operations. But the health of the general was so bad, and the determination of his followers not to remain another rainy season in Assam so strong, that he found it expedient to accept the terms of peace offered by the Ahom king. At the beginning of 1663 the army began its retreat down the valley of the Brahmaputra, and after suffering considerable hardships finally reached Bengal. Mir Jumla himself did not survive the failure of his expedition, and died on the river a little distance above Dacca.

The Muhammadans compelled to retreat by disease.

After stormy
period
Gauhati
finally cap-
tured by
Gadadhar
Singh, circa
1685 A. D.

The unfortunate town, Gauhati, continued to be the sport of the contending powers. Four years after Mir Jumla's retreat it was re-taken by the Ahoms, but they only held it for five years, and in 1672 the Muhammadans found themselves able to re-occupy the town. From 1670 to 1679 was a most disastrous period in Ahom history. No less than seven princes succeeded to the throne, only to perish by poison or the knife of the assassin, and there was no central authority in the state strong enough to control the turbulent nobles or to repel invasion from without.

In 1681 Gadadhar Singh headed a rising against the prime minister, who had seized the reins of Government, murdered the puppet prince in whose name he ruled, and proceeded to set the state in order. He re-occupied Gauhati, and with its capture the last vestige of Muhammadan rule disappeared for ever from Kamrup. It most assuredly was time for the district to be allowed some rest. In the short space of fifty years Gauhati had been occupied by a hostile force no less than eight times, and this continual taking and re-taking of the town must have been fraught with the utmost misery for its inhabitants. From this time onward Kamrup became part of the Ahom territories, and was administered by a viceroy who was stationed at Gauhati. But before describing the growth of the Ahom power in Lower Assam, and the customs and institutions of that vigorous people, some reference must be made to the various inroads made by the Muhammadans upon the district prior to the final invasion of Mir Jumla in 1662.

Bengal was conquered in 1203 A. D., and the victorious general Baktiar Khilji proceeded eastwards into Assam. The difficulties of the country proved to be insuperable, and he was compelled to retire without annexing any portion of the Brahmaputra Valley. He was followed by Ghiyas-ud-din Bahadur Shah, who is said to have advanced as far as Sadiya in 1220 A.D., but, though at first successful, he too was at last defeated and driven back to Gaur. Thirty-six years later Ikhtiyar-ud-din Yuzbak Tughril Khan invaded Kamrup and erected a mosque in commemoration of his victories, but his triumph was of very short duration. When the rains broke the Assamese returned and attacked the invaders, who were now weakened with disease. The general and most of his followers were killed, and only a few returned to Bengal to tell of the destruction of the army. He was followed by Muhammad Shah, who in 1337 A. D. "sent 100,000 horsemen well equipped to Assam, but the whole army perished in that land of witchcraft and no trace of it was left." *

This extract plainly reflects the feelings with which Assam was regarded by the Muhammadans. Time after time their armies, which had overrun Upper India and Bengal with so little difficulty, were foiled by the heavy jungles and the moist unhealthy climate of the Brahmaputra Valley. Such continuous failure could only in their estimation be due to some more than natural cause.

To the conquest of Nilambor by Husain Shah it is hardly necessary to refer, as his capital Kamatapur is

* Alamgirnamah, p. 731.

situated in Kuch Bihar, and it is doubtful whether the Muhammadans on this occasion advanced into Kamrup.

In 1506, Turbuk marched up the valley as far as Kaliabar, and there gained a victory over the Ahom troops. He met with less success in his second invasion of Assam, and was defeated and killed in a bloody battle on the Bhareli in 1532. Twenty-one years later Kala Pahar, a Hindu apostate, made a marauding expedition into the valley, and attempted to demolish the temples at Kamakhya and Hajo. A fanatical zeal for the propagation of his new religion seems, however, to have been his guiding motive, and no attempt was made to permanently annex new territory to the Mughal Empire. The various wars between the Muhammadans and the Koches and the Ahoms have already been described in detail.

The Ahoms.

We must now retrace our steps to describe the origin of the Ahoms, the vigorous power who drove the Muhammadans from Kamrup, and from whose faltering hands the British received the sovereignty of Assam.

The Ahoms were a Shan tribe from the kingdom of Pong, in the upper valley of the Irawadi, who, at the beginning of the thirteenth century A. D., crossed the Patkai, and settled in the south of the territory which has since been formed into the districts of Sibsagar and Lakhimpur. The country at the foot of the hills was occupied by tribes of Morans and Borahis, whom they easily subdued, and who were soon absorbed by inter-marriage with their conquerors. The history of the gradual development of the

Ahom power, and of the manner in which they overthrew first the Chutiya kingdom at Sadiya, and afterwards the Kachari kingdom at Dimapur, will be found in the Gazetteer of the Sibsagar district, as this is a matter with which Kamrup had little or no concern. At the beginning of the seventeenth century the Ahom kings began to intervene in the affairs of Lower Assam, and their struggles with the Ahoms for the possession of Gauhati have already been described.

Gadadhar Singh was the first king to definitely annex Kamrup to the Ahom territories, but the zenith of their power was reached in the reign of his successor Rudra Singh (1695—1714). This powerful prince waged successful wars against the Kachari Raja and the king of Jaintia, and his generals brought both of these chiefs captive to the Ahom Court. He founded a new capital at Rangpur in the Sibsagar district, reduced the whole of Assam proper to order, and finally died at Gauhati in the nineteenth year of his reign. The Rudeshwar temple, which stands on the north bank of the river opposite the town, was erected by his son in memory of this sad event.

His son Sib Singh was a weak prince, much under the influence of his wives, whose name has come down to posterity as excavator of the great tank near which the present station of Sibsagar (Sib's tank) stands. Both he and his two successors were ardent Saktists, and erected numerous temples, and made liberal grants of land and *paiks*, for the maintenance of their special form of Hinduism.

Rudra Singh

A. D.

**Pramatta
Singh,
1744-1751.
Rajeswar
Singh,
1751-1769.**

The reign of his successor Pramatta Singh was uneventful, and, during the incumbency of the next prince Rajeswar Singh, the signs of the decay of the Ahom power became all too clear. The Raja of Manipur was driven from his home and applied to the Ahom king for aid. Orders were issued for the despatch of an expedition, but the nobles, to whom the command was entrusted, excused themselves on various grounds and declined the proffered honour. The army lost its way when endeavouring to cross the Patkai, a large number of men perished, and, though ultimately the Manipur Raja succeeded in regaining his dominions, it does not appear that the assistance of the Ahoms materially contributed towards his success.

**Lakshmi
Singh,
1769-1789.
The Moama-
ria Insurrec-
tion.**

Lakshmi Singh's reign was signalized by the outbreak of the Moamaria insurrection. The causes of this insurrection are not quite clear. According to the chroniclers, a certain Hathidharia Chungi with one Nahor Kachari came to offer their annual tribute of elephants to the king. The elephant which they tendered to the Borbarua was a lean and sorry animal, and, as an expression of his disapproval, he cut off their hair and noses, flogged them, and drove them away. Boiling with indignation at this outrage, Nahor proceeded to the house of a Hari woman, whose daughter he espoused, and from whom he received a set of metal plates, covered with mystical incantations to confound the enemy. He then applied to the Moamaria gosain for help, which was readily afforded him, and the standard of revolt was raised. This is the account given by the Ahom chroni-

clers, and it differs to some extent from the story as told by the Moamaria gosain at the present day. According to this authority, the leaders of the rebellion were two Moamarias named Nahor Khora and Ragho Neogay, who, after they had been punished for failing to deliver the elephants required, went for assistance to their gosain. The gosain himself declined to listen to their proposals, but they succeeded in winning over his son Gagini Bardekha, who gave them a weapon consecrated with the magic plates of the Kalpataru. The Kalpataru was a sacred book which Anirudha is said to have obtained from Sankar Deb, though the Ahom chroniclers contemptuously assert that it was the property of a sweeper woman.

From the very first the rebels carried all before them. The royal armies were defeated under circumstances which suggest that men and officers alike were guilty of gross incompetence and cowardice; and Lakshmi Singh was driven from his capital and captured. The insurgents then proceeded to appoint Ramakanta, the son of Nahor Khora, to be their Raja. Marauding parties harried the country on every side, and the misery of the common people was extreme. A report at last gained ground that orders had been issued for the execution of all the former officers of state, and this incited the adherents of the king to make one final effort. The signal for the attack is said to have been given by one of the wives of Lakshmi Singh. Ragho, who was one of the most influential men amongst the Moamarias, had forcibly taken her to wife, and, as he was bending down

Success and
subsequent
defeat of
Moamarias.

at the *bihu* to offer his largess to a dancing boy, she cut him down with a sword. On the death of their leader, the rebel forces were surprised and scattered, and a pitiless vengeance taken that spared neither age nor sex.* The house of the Moamaria mahunt was surrounded, and almost the whole of his family was killed before his eyes, while all the officers appointed by the Moamaras were seized and beaten to death. The wives of the rebel prince were treated with savage cruelty. One of them was flogged to death, while two others had their ears and noses cut off and their eyes put out.

Gaurinath
Singh,
1790-1795.

Moamaras
again victo-
rious.

In 1780, Lakshmi Singh died, and was succeeded by his son Gaurinath, in whose reign the Moamaria insurrection broke out anew, and with increased violence. At first, the king's troops met with some measure of success, and orders were issued outlawing the rebels and authorizing any person to kill any Moamaria he might meet, regardless of time, place, sex, or age. Such orders seem to have been only too well adapted to the temper of the people, and, according to the Ahom chronicler, "the villagers thereupon massacred the Moamaras with their wives and children without mercy." The rebels in their turn were not slow to make reprisals; they plundered the country on every side, and "the burning villages appeared like a wall of fire." The ordinary operations of agriculture were suspended, no harvests could be raised, and famine killed those whom the sword had spared. "The price of a katha of rice rose to one

* The Moamaras say that 790,000 members of their sect were killed, which is no doubt an exaggeration.

gold mohur, and men starved in crowds under the trees forsaking their wives and children." The highest Hindu castes are said to have eaten the flesh of cows, and dogs and jackals were devoured by the common people.

In 1786, the rebels under Bharat Singh inflicted a decisive defeat upon the royal troops, and took Rangpur, the capital, by storm. The king fled to Gauhati, and in his terror left even his wives behind him. His generals remained behind in Upper Assam and carried on the contest with varying success. Troops were despatched to their assistance from Manipur, but most of them were ambushed and cut up, and the survivors had no heart to carry on the struggle. The desolation of the country is thus described by the Ahom chronicler. "The Mataks harried the temples and the idols of the gods, and put to death all the sons and daughters of our people. For a great length of time our countrymen had no home, some took shelter in Bengal, some in Burma, some in the Daffa Hills, and others in the fort of the Buragohain who was fighting with the Mataks for years and months together." Bharat Singh ruled at Rangpur for upwards of six years and coins are extant which bear his name; but in 1792 a small British force was sent to the assistance of the Ahom king under the command of Captain Welsh. Gauhati, which had been captured by a mob of Doms under a Bairagi, was re-taken, Krishna Narayan, the rebellious Raja of Mangaldai, was subdued, and in March 1794 Rangpur was re-occupied after a decisive victory over the insurgents. Captain Welsh was then recalled, but the Ahom king was able to keep his

enemies in check by the help of sepoy trained on the English system.

**Kamaleswar
Singh,
1795-1800
A. D.**

A few months after the departure of Captain Welsh, Gaurinath died and was succeeded by his son Kamaleswar Singh. The country was still in a state of great disorder. The Daflas, not content with harrying the villages on the north bank, crossed the Brahmaputra and attacked the royal troops near Silghat, but were repulsed with considerable loss. Even Europeans were not safe, and a Mr. Raush,* a merchant of Goalpara, who had extended his business operations to Darrang, was robbed and murdered by "naked Bengalis." These freebooters then occupied North Gauhati, but when they attempted to make good their position on the south bank, they were defeated with heavy loss by the royal troops near Pandu-ghat. The Daflas again harried the Darrang district, and even enlisted Bengali sepoy in their service, but were ultimately conquered and dispersed. Victories were also obtained over the Moamarias and the Khamtis at the eastern end of the valley.

**Hardatta's
insurrec-
tion.**

During the reign of this prince there was a local insurrection in Kamrup, which is commemorated in the songs of the villagers at the present day. The relations between the Ahoms and the natives of the district, or Dekheris as they were somewhat contemptuously called, were far from cordial, and the latter were not allowed to

* This Mr. Raush was the first European to interfere in the affairs of Assam. He sent 700 burkandazes to Gaurinath's assistance, but they were cut up to a man. A mass of masonry, the size of a small cottage, covers the remains of Mr. Raush's infant children at Goalpara.

remain within the fortifications of Gauhati after nightfall. One night a respectable Chaudri, named Hardatta Borua, was abused by the officer commanding the guard below the Nilachal hill. Indignant at this insult, Hardatta assembled his friends and followers and attacked Gauhati. The Ahom governor fled, and for a short time Hardatta occupied the town, but, on the approach of a strong Ahom force, he sought shelter in the jungle. He was soon captured and put to death, but his memory is still cherished by the people of Kamrup.

In 1809, Kamaleswar Singh was succeeded by his brother Chandra Kanta Singh. The Bor Phukan or viceroy of Gauhati incurred the suspicion of the Buragohain or prime minister and fled to Calcutta and thence to Burma. At the beginning of 1816, a Burmese army crossed the Patkai and reinstated the Bor Phukan; but shortly after their withdrawal Chandra Kanta was deposed, and Purandar Singh appointed in his stead. The banished monarch appealed to the Burmese, who, in 1818, returned with a large force and replaced him on the throne.

They soon, however, made it clear that they intended to retain their hold upon Assam, and in 1820 Chandra Kanta fled to Goalpara, and from British territory began a series of abortive attempts to recover his lost kingdom. The Burmese were guilty of gross atrocities during their occupation of the country, the villages were plundered and burnt, and the people were compelled to seek shelter in the jungle. Women who fell into their hands were violated with every circumstance of

Final collapse of the Ahom kingdom.

brutality, and the misery of the unfortunate Assamese was extreme. Fortunately for them, causes of quarrel had by this time arisen between the British and the Burmese. In 1824, war was declared by the British Government, and a force was sent up the valley of the Brahmaputra. The Burmese evacuated Gauhati without striking a blow, and such fighting as there was took place in the districts of Sibsagar and Nowgong. Rangpur was occupied in 1825, and in the following year, by the treaty of Yandaboo, Assam was ceded to the East India Company.

Ahom Administration. The paik system.

The above is but a brief account of the rise and fall of the Ahoms, but their history is more intimately connected with the Sibsagar district. It now remains to consider what is known of their social institutions, and the conditions under which those subject to them passed their lives.

The most striking feature in the economy of the Ahom state, and one which (to judge from their conduct since they came under our rule) must have been extremely repugnant to the people, was the system of enforced compulsory labour. The lower orders were divided up into groups of three or four called *gots*, each individual being styled a *powa paik*. Over every twenty *gots* was placed an officer called *bara*, over every five *baras* a *saikia*, and over every ten *saikias* a *hazarika*. In theory one *paik* from each *got* was always employed on duty with the state, and, while so engaged, was supported by the other members. The Raja and his

ministers had thus at their disposal a vast army of labourers to whom they paid no wages, and for whose maintenance they did not even have to make provision. It was this system which enabled the Ahom Rajas to construct the enormous tanks and great embankments, which remain to excite the envy of a generation, which has been compelled to import from other parts of India almost all the labour required for the development of the Province and its industries. Many of the works constructed were of undoubted utility, but many, on the other hand, were chiefly intended for the glorification of their designers. Few objects are more worthy of the attention of an enlightened government than the supply of wholesome drinking water to the people. But the huge reservoirs, constructed by the Ahom kings, were out of all proportion to the population which could by any possibility have made use of them, while the close proximity in which these enormous tanks are placed is ample evidence that practical utility was not the object of their construction. On the other hand, embankments which were thrown up along the sides of some of the rivers near the capital, protected land which has become unculturable since they have fallen into disrepair. The duty of providing the various articles required for the use of the king and the nobility was assigned to different groups, which were gradually beginning to assume the form of functional castes. The rapidity with which these groups abandoned their special occupations, as soon as the pressure of necessity was removed, is a clear indication of the reluctance with

which they must have undertaken the duties entrusted to them.*

War.

But though the common people seem to have been compelled to supply an unnecessary amount of labour in times of peace, it was when war was declared that their sufferings were most pronounced. Certain clans of *paiks* were called out, and called out, it would seem, in numbers that were in excess of the actual requirements of the case; an error which entails the most disastrous consequences when the campaign is carried on in a country where supplies are scarce and communications difficult.

According to the Ahom chronicler, nearly 40,000 troops were despatched during the reign of Rajeswar Singh to reinstate the Manipuri Raja on the *gaddi*. Their guides, however, failed them; they lost their way in the Naga Hills, and about two-thirds of the soldiers perished, the mortality being chiefly due to famine and disease. The military dispositions even of Rudra Singh, one of their greatest princes, suggest a want of due deliberation in design, and a feebleness and lack of method in execution. In his expeditions against the Kachari and Jaintia Rajas, the Ahoms lost 3,243 persons, and the practical results obtained seem to have been insignificant. The descriptions of the campaigns against the Moa-

* The system of enforced labour was no doubt unpopular, but it had much to recommend it. It taxed the people in the one commodity of which they had enough and to spare, *i.e.*, labour. It also developed them on the industrial side, and the material comfort of the ~~Assamese~~ would possibly have been greater at the present day if they had not all of them been allowed to devote themselves exclusively to agriculture.

marias, given by the Ahom chroniclers, clearly show that the generals were often guilty of incompetence and cowardice, while the rank and file do not seem to have fully realized the dangers that beset a defeated army. Conditions such as these must of necessity have been disastrous to the private soldier.

The Muhammadan historians of the invasion of Mir Jumla give, however, a more favourable account of the Ahom military dispositions.* Their resources seem to have been considerable, and, in the course of the expedition, the Muhammadans captured 675 guns, one of which threw a ball three "mans" in weight, besides a large number of matchlocks and other field pieces. No less than 1,000 ships were taken, many of which could accommodate three or four score sailors; and in the naval engagement which took place above Silghat in March 1662 A. D., the Assamese are said to have brought seven or eight hundred ships into action. The Ahoms are described as strongly built, quarrelsome, bloodthirsty and courageous, but at the same time merciless, mean, and treacherous. They were more than equal to the Muhammadans in a foot encounter, but were much afraid of cavalry. This *corps d'élite* did not, however, exceed some 20,000 men, and the ordinary villagers, who were pressed into the service, were ready to fling away their arms and take to flight at the slightest provocation.

Muhamma-
dans des-
cribe Ahoms
as brave
soldiers.

Another factor, which cannot but have re-acted unfavourably upon the common people, was the uncertainty

and arbitrar-
y character
of Govern-
ment.

* An interesting account of this invasion will be found in the Journal of the Asiatic Society of Bengal, Volume XLI, Part I, pages 49—100.

of tenure, under which both the ministers and king held office. A perusal of the Ahom chronicles leaves the reader with the impression that the ministers were continually being deprived of their portfolios, and not unfrequently of life itself. Hardly less precarious was the position of the king, and in the short space of 33 years, between 1648 and 1681, no less than two monarchs were desposed, and seven came to a violent end. Good government, as we understand the term, must have been impossible under such conditions, and we may be sure that the people suffered from this constant change of rulers. Buchanan Hamilton, writing at the beginning of the nineteenth century, states that the administration of justice under Ahom rule was fairly liberal. Important trials were conducted in open court, the opinion of assessors was consulted, the evidence was recorded, and capital punishment was only inflicted under a written warrant from the king. It is true, no doubt, that few persons possessed the power of imposing the death sentence. But they were allowed to inflict punishments which the victim could hardly be expected to survive, and his position was not unlike that of the heretic delivered by the inquisition to the civil arm, with the request that "blood may not be shed."

Instances
of this.

Abundant evidence is available in the Ahom chronicles to show the arbitrary way in which the royal authority was exercised. The following instances are quoted from the reign of Pratap Singh, 1611—1649 A. D. A Katak, or envoy charged with diplomatic relations with foreign powers, asked the Muhammadan commander

on his frontier to supply him with two jars. His conduct was reported to the king, who immediately ordered him to be put to death. Another Kataki reported that he had heard from a down-country man that a Muhammadan force was advancing up the valley. The king enquired of the Kataki responsible for watching the movements of the enemy, whether this information was correct. This man declared that he was unable to obtain any confirmation of the rumour, whereupon the first Kataki was executed for presuming to meddle in matters with which he had no concern; a proceeding which seems to have been hardly calculated to ensure the supply of timely and accurate information. Three merchants then endeavoured to establish friendly relations between the Nawab of Dacca and the Ahom king. The latter prince took umbrage at such unwarrantable interference in affairs of state, and ordered the merchants to be put to death. It subsequently appeared that the facts had not been correctly represented, and the Bor Phukan and two other men responsible were promptly killed. A few years later, the king transported a large number of persons from the north to the south bank of the Brahmaputra, warning them that any one who attempted to re-visit his former home would suffer the penalty of death with all his family "even to the child in the womb." Five hundred men attempted to return, as they wished, the chronicler informs us, to rear a brood of silkworms. The king had them arrested, and 300 were put to death, the remainder escaping in the darkness of the night.

**Savage punishments:
an official
blinded for
not dismounting
before
his official
superior.**

The following incident that occurred in the reign of Lakshmi Singh (1769—1780) is typical of the uncertainties of the time. One Ramnath Bhorali Borua, an officer of state, had the presumption to appear mounted in the presence of his official superior the Borborua. A complaint was promptly laid before the king, who directed that both Ramnath and his brother should be deprived of sight. The injured man was not, however, destitute of friends, and came with his complaint to the Kalita Phukan, who had his private reasons for desiring the downfall of the Borborua. The Phukan went to the king, poisoned his mind against his minister with the suggestion that a conspiracy was on foot, a suggestion which in those days must always have seemed plausible enough, and, in a short time, the heads of the haughty Borborua, his two uncles and his brother were rolling in the dust. It is needless to multiply instances of the savage violence of the times, but the different forms of punishment in vogue call for some remark. Where life was spared, the ears, nose, and hair were cut off, the eyes put out, or the knee-pans torn from the legs, the last named penalty generally proving fatal. Persons sentenced to death were hung, impaled, hewn in pieces, crushed between two wooden cylinders like sugarcane in a mill, sawn asunder, burnt alive, fried in oil, or, if the element of indignity was desired, shorn of their hands and feet and placed in holes, which were then utilized as latrines.

In the seventeenth century, it was no uncommon thing

to compel conspirators to eat their own flesh, and more than one case is quoted, in which the father was forced to eat the liver of his son, a meal that was usually his last in this world. Punishment too was not restricted to the actual offender, but his wretched wife was liable to be handed over to the embraces of a Hari. Methods such as these could hardly fail to have a terrifying effect on much more hardened criminals than the Assamese.

The Ahoms, even after they became a powerful nation, Social life amongst the Ahoms. seem to have adhered to a simple style of life, in which there was little of extravagance or luxury. They have left few masonry memorials of their rule; the Raja's palace is almost invariably referred to as "a planked house," and, according to Buchanan Hamilton, the king alone was allowed to erect an edifice of brick. Shoes might not be worn except by the special license of the king, bedsteads and curtains were only to be found in the houses of the rich, and all but the most important visitors to a noble's house sat on the bare ground. The account given of the Raja's palace at Gargaon by the historian of Mir Jumla's invasion is pitched in a more exalted key. Twelve thousand workmen had been engaged on its construction for a year, and the audience hall was 120 cubits long by 30 wide. "The ornaments and curiosities with which the whole woodwork of the house was filled defy all description: nowhere in the whole inhabited world would you find a house equal to it in strength, ornamentation, and pictures." The absence of all reference to these wonders in the Ahom histories suggests, however, that the Muhammadans were anxious

to magnify the power and majesty of the prince they had subdued.

The native chroniclers are naturally most concerned with the wars and religious festivals, which bulked so largely in the eyes of the historians of the day, and with the rise and fall of successive families of ministers. It is only incidentally that light is thrown on the social conditions of the people. The kings seem to have indulged in frequent tours about their territories, the itinerary usually followed being Rangpur, Sonarinagar, Tengabari, Dergaon, Jaliarang Bornagar, Bishnath, and Kaliabar. They were fond of fishing and shooting, and fully appreciated the excitement to be obtained from the hunting of wild elephants. On the occasion of coronations and royal weddings, a week was generally devoted to the festivities, which seem, however, to have consisted for the most part of prolonged feasts, accompanied by much unmelodious music. Towards the end of the eighteenth century, acrobats and jugglers were imported from Bengal, who amused their royal patrons with tricks which are still shown to the tourist on the P. & O. Kamaleswar Singh visited in state the two principal *sattras* of Auniati and Dakhinpat, and was entertained with all his retinue by the gosains. The chronicler quaintly tells us that the lunch at Dakhinpat gave greater satisfaction than the one at Auniati; but does not say whether this was due to the superior skill of the Dakhinpatia cook, or to the greater beauty of the *sattra* precincts.

The first Hindus to influence the Ahom kings were Saktists, and Pratap Singh (1611—1649) persecuted the Vaishnavites, one of whose leaders had converted his son to Hinduism. The disciples of the gosains were seized, human ordure was placed on their foreheads, and they were degraded to the sweeper caste. To be found in the possession of religious books meant death, not only to the actual owner, but to every member of his family. Even Pratap Singh's spiritual pastors were not spared, and he denounced the new religion which, in spite of the adherence of the Raja, had not been able to save from death his own beloved son. He then assembled 700 Brahmans ostensibly to perform a festival, and, as a punishment for their incompetency, degraded them to the status of *paiks*. These persecutions were continued by Gadadhar Singh, who, in 1692, plundered the treasure houses of the Vaishnavite gosains, and cast the idols into the water. No respect was shown even to the sacred head of the Auniati *sattrā*, and he was driven from his home to Tejikhāt. He fared, however, better than the gosain of Dakhinpat, who had his eyes put out and his nose cut off, while many Hindu priests were put to death. A policy of extermination seems in fact to have been inaugurated, and, according to one chronicler, orders were issued for the destruction of every Hindu child regardless of sex and age. The king had large quantities of pork, beef, and fowls cooked by men of the Dom caste, and compelled Kewats, Koches, Doms, and Haris to partake of their unholy food.

Attitude of
Ahoms to-
wards Hin-
duism. Sa-
vage perse-
cution of
Vaishna-
vism.

This policy of oppression was reversed during the

reign of Rudra Singh, his son, who was publicly admitted as a disciple of the Auniati gosain ; and, from this time forward, the influence of the priests seems to have increased.

**Laxity of
Ahom Hin-
duism.**

But, though converted to Hinduism, the Ahoms found the restrictions of their new religion irksome ; and their gosains, with the tact which they display towards their converts of the present day, allowed their new disciples a considerable degree of latitude. Rudra Singh, though he had been publicly admitted to the church by the Auniati gosain, feasted his followers on buffaloes and pigs on the occasion of his father's funeral ; while not only buffaloes but even cows found a place in the menu of his coronation banquet. At the time of the first Moamaria insurrection, the rebel chief made overtures to Lakshmi Singh, and offered him, apparently in good faith, a pig for supper. A present such as this clearly shows that even towards the end of the eighteenth century the Hinduism of the Ahom kings was one of the most liberal variants of that catholic creed. Before taking any decisive step, it was the practice to refer, not only to the Brahmans and Ganaks, but also to the old Ahom priests the Deodhais and Bailongs. These venerable men were required to consult the omens, by studying the way in which a dying fowl crossed its legs ; a system of divination which is in vogue amongst many of the hill tribes of Assam to the present day. The restrictions of caste were evidently somewhat lax, as we hear that the Moamaria mahunt had an intrigue with a Hari woman ; while at the beginning of the nineteenth century

the viceroy of Gauhati took a fisher girl for his mistress, a breach of the *convenances* for which, it should be added, he was deposed.

The influence of the Muhammadans in Assam Proper was so slight that the low view they professed to take of the other sex had little or no effect upon the general population. The Ahoms, like their Burmese ancestors, held their woman folk in honour, and, even at the present day, the *purdah* and all that it implies is almost unknown in the country inhabited by the Assamese. The Ahom princesses seem to have taken a prominent part on ceremonial occasions, and not unfrequently exercised considerable influence on affairs of state. In the middle of the 17th century, two of the queens almost usurped the reins of government, and, according to the Ahom chronicler, "their words were law." When called to account by the successor of their husband, they proudly stated that they had been of great service to the king, at a time when he was ignorant of the way in which he should behave, whether when "eating, drinking, sitting, sleeping, or at council." Sib Singh (1714—1744) is said to have abdicated in favour of his queens, hoping thereby to defeat a prophecy which declared that he would be deposed; and coins have been found bearing the names of four of these princesses. The mother of Lakshmi Singh dug a tank, and Gaurinath entrusted to his stepmother the control of the *Khangia mel*, and consulted with his mother about affairs of state. It was not, however, only the princesses of royal blood who concerned themselves with public matters. At the

The position
of women

time of the Moamaria insurrection, one Luki Rani was sent against the rebels; and the victory over Turbuk in 1532 is partly ascribed to the courageous action of the widow of the Buragohain, who had been killed in a previous engagement by the Muhammadans. Desperate at the loss of her husband, she put on armour and rode into the ranks of the enemy to avenge his death. No mercy was shown her and she fell, pierced with spears; but her example emboldened the Ahoms, who at once advanced to the attack and defeated the Musalmans with great slaughter.

**Condition of
Province at
time of
cession to
the British.**

In estimating the effects of British rule it is necessary to form a clear idea of the state of the Province at the time when it passed into our possession, and first it must be pointed out that the British did not conquer Assam in the sense in which that word is usually employed. The native system of government had completely broken down, the valley was in the hands of cruel and barbarous foreigners, and it was not as conquerors, but as protectors and avengers that the English came. They were certainly not inspired by any lust for land. For some time after the expulsion of the Burmese, the East India Company were doubtful whether they would retain their latest acquisition, and an attempt was made to administer the upper portion of the valley through a descendant of the Ahom kings.

The condition in which we found the country was lamentable in the extreme. For fully fifty years, the Province had been given over to desolation and anarchy.

Life, property, honour were no longer safe, and the people in their misery had even abandoned the cultivation of the soil, on which they depended for their very livelihood. Bands of pirates used to raid up the valleys of the Dhansjri and Kakadanga, and return with their boats laden with booty, leaving ruin, death, and desolation in their wake. The hill tribes were no longer kept in order, and the Daflas descended and harried the submontane tracts, and even extended their depredations to the south of the Brahmaputra. The treatment meted out to the unfortunate villagers can be judged from the protest made by the hillmen to Rajeswar Singh, shortly before the collapse of the Ahom government, when they begged him "not to pull out the bones from the mouth of dogs." Buchanan Hamilton, writing in 1808 A. D., states that north of the Brahmaputra "there is no form of justice. Each power sends a force, which takes as much as possible from the cultivator."

The memories of this miserable time survived long after it had passed away. In 1853, an Assamese gentleman, Srijut Ananda Ram Dhekial Phukan, wrote as follows to Mr. Moffatt Mills:—"Our countrymen hailed the day on which British supremacy was proclaimed in the Province of Assam, and entertained sanguine expectations of peace and happiness from the rule of Britain. For several years antecedent to the annexation, the Province groaned under the oppression and lawless tyranny of the Burmese, whose barbarous and inhuman policy depopulated the country, and destroyed more than one half of the population, which had

Native testimony on this point.

already been thinned by intestine commotions and repeated civil wars. We cannot but acknowledge, with feelings of gratitude, that the expectations which the Assamese had formed of the happy and beneficial results of the Government of England, have, in a great measure, been fulfilled ; and the people of Assam have now acquired a degree of confidence in the safety of their lives and property, which they never had the happiness of feeling for ages past."

Whatever errors have been committed by the British Government, and it is too much to hope that no mistakes of policy have been made during an administration of nearly eighty years, there can be no question that the introduction of a settled form of government has been of the greatest benefit to the immense mass of the people to whom it has been extended.

**Buchanan
Hamilton's
account of
Kamrup.**

Buchanan Hamilton, who compiled a memoir on Assam in 1808 A. D., pointed out that the viceroy at Gauhati was not only the ruler of an extensive district, but was in charge of the relations between Assam and Bengal, and was thus placed in a position of exceptional responsibility and power. On the southern frontier of Kamrup there were various minor chiefs, whose position was not unlike that enjoyed by the siems in the Khasi Hills at the present day. They exercised judicial powers in petty cases, and were bound to supply the Ahoms with *paiks*, or money in their place, and to attend with a contingent in times of war. The headquarters of these chiefs, many of whom were of Garo birth, were situated at Barduar, Bholagram, Mairapur, Lukhiduar,

Pantan, Bongram, Vagaduar, Beltala, Dumoriya, and Rani. Gauhati, which is described as being a very poor place, was garrisoned by some five or six hundred men, about one hundred of whom were natives of Western India.

For many years after our occupation of Assam Gauhati remained the headquarters of the Province, but it enjoyed a very evil reputation for unhealthiness. Mr. Cosh, writing in 1837, said that, to judge from the reports of the natives themselves, it was the most unhealthy station in Assam, and that the records of the hospital exhibited a rate of mortality surpassed by few stations in India. Few positions, in fact, could have been worse chosen in so far as health was likely to be concerned.*

Gauhati
headquarters of
Assam; its
unhealthiness.

Colonel Hopkinson, the Commissioner, brought a powerful indictment against the district when advocating the transfer of his headquarters to Shillong.† Mr. David Scott, the first Agent to the Governor-General on the North-East Frontier, declined, he said, to sleep on shore at Gauhati, though his indifference to exposure and fatigue were well known. Mr. Robertson, the next Commissioner, and his successor, Mr. Cracroft, avoided the town most sedulously, and it was only towards the end of his service that the next Commissioner, General Jenkins, spent any considerable portion of his time in this unfavoured spot. Colonel Hopkinson's denunciations of the town find strong confirmation in the crowded cemetery.

*Topography of Assam, p. 88.

†Letter No. 338, dated 28th September 1866, to the Board of Revenue.

The European population of the place must have been very small, but death was only too busy in their ranks. There is hardly a year which is not commemorated by its tombstone, and in many years there were three or four deaths amongst this small community. On the erection of Assam into a separate Province under a Chief Commissioner the headquarters of the new Administration were located at Shillong, but since that date sanitary improvements have done much to improve the public health, and Gauhati is no longer the unhealthy place it was.

**The Bhutan
war of 1864.
Occupation
of Dewan-
giri.**

No disturbances occurred in Kamrup in connection with the Mutinies of 1857. The next historical event with which the district is connected is the Bhutan war of 1864, which was the natural sequel to the indignities offered to the envoy, who had been sent to adjust the differences outstanding between that country and the Government of India. At the time when we entered upon the administration of the district we found the Bhutias in possession of the country lying at the foot of the Bhutan Hills, *i.e.*, the duars of Bijni, Chappakamar, Chappaguri, Banska, and Ghaukalla. The Bhutias were allowed by us to remain in occupation till 1841; but in that year the duars of Kamrup and Mangaldai were annexed by the Company, and an annual payment of Rs. 10,000 was offered as compensation to the Bhutan State. On the outbreak of war it was decided that operations should be undertaken against the whole length of the Bhutan frontier. In December 1864, a column, under the command of Colonel Campbell, marched northwards

from Gauhati to attack the Bhutia post at Dewangiri.* The main body advanced with considerable circumspection, and, while they were still reconnoitring the pass, news arrived that Dewangiri had been captured by Captain Macdonald with fifty native policemen. The resistance offered had not been of a very serious character, and the British loss consisted of one policeman killed and five wounded. A garrison of six companies of native infantry and two mountain howitzers of the Eurasian battery was quartered in the village, and it was thought that they would have no difficulty in repelling any attack that might be made upon them.

The Bhutias had, however, returned in considerable force. About 5 A. M. on January 30th the camp was suddenly rushed, and, though the enemy were driven off with some loss, they continued to assume an exceedingly aggressive attitude. Our loss on this occasion was one British officer killed and one wounded, and four sepoy killed and thirty-one wounded. Four days later the Bhutias threw up a stockade within five hundred yards of the camp, and managed to cut off the principal source of water-supply. They also succeeded in occupying the mouth of the Darranga pass, and on February 4th Colonel Campbell decided to evacuate the post, and to make his way by another route to the plains. A retreat by night through mountainous and jungly country is not an easy operation to perform, and a certain want

Dewangiri
abandoned
and re-
taken.

*The information contained in the following paragraphs has been taken from "Bhootan and the Story of the Dooar War," by Surgeon Rennie. London, John Murray, 1866.

of steadiness was shown on this occasion. Some of the wounded were left behind, the guns were abandoned, and subsequently fell into the possession of the Bhutias, and officers and men lost everything which they possessed. The enemy did not attempt to pursue the retreating troops, but it was of course impossible to acquiesce in this reverse. A strong force was collected at Kumrakatta, and at the beginning of April the position was re-taken without difficulty. Not a single soldier was killed on the British side, but the Bhutias lost over one hundred men, as the native troops, on forcing their way into the stockade, seem to have got out of hand, and to have gone to unnecessary lengths in breaking down the resistance offered to them. With the re-capture of Dewangiri active operations ceased on the Kamrup frontier, and since that date the village has continued to form part of British territory.

**Subsequent
history.**

The subsequent history of the district has been uneventful. During the last twenty years of the nineteenth century, public health was extremely bad, and thousands of persons died of the curious contagious fever known as *kala azar*, which is described in the section on the medical aspects of the district.

**The re-as-
sessment of
1893.**

In 1893 the land revenue assessment, which had remained unchanged for a quarter of a century, was enhanced, and the villagers in certain portions of the district combined to refuse payment. On December 24th, 1893, a mob of about 200 men looted the Rangia market, and, though the District Superintendent of Police was deputed to the

place, the attitude of the people was so threatening that he was unable to arrest the persons who were responsible for the outrage. The Deputy Commissioner accordingly proceeded to Rangia, and succeeded in securing the ringleaders. A large crowd soon assembled and threatened to sack the thana, and were only dispersed by the sepoy and armed civil police that formed his escort. Affairs then quieted down in this portion of the district, but on January 21st the villagers assaulted a mauzadar and mandal at Kapla in Sarukhetri mauza, and beat the latter so savagely that he died a few days afterwards. The Subdivisional Officer happened to be in camp close by, and succeeded in arresting many of the rioters. But, as the mob were evidently prepared to rescue them by force, he was compelled to let them go, and when night came he fell back upon Barpeta. The Deputy Commissioner proceeded to his assistance without delay, arrested 59 of the rioters, and, when the mob threatened to rush his camp, dispersed them with his escort, which consisted of 15 sepoy and 15 armed police. The disturbances then quieted down, and the revenue of the district was collected without difficulty. The earthquake of 1897 is the only incident of grave importance which has occurred of recent years, and the effects of that terrible cataclysm of nature have already been described.

In addition to the numerous temples, to which reference is made in the ensuing chapter, there are several remains of interest to the antiquarian in Kamrup. Barnagar, which was formerly the capital of the Koch kings Bali Narayan and Parikshit, is situated about eight miles north

Archæological remains.

of Barpeta. The site is now covered with dense tree forest, but fruit trees, tanks, and the signs of human habitation can still be seen. Another memorial of the Koch dynasty is the Gohain Kamala Ali, the great road which was constructed by Nar Narayan through North Kamrup and Mangaldai. Near Betna, in the Rangia tahsil, is the Baidargarh, which is a square enclosure, or fort, surrounded by embankments, each of which is some four miles in length. It is said, but very little weight can be attached to the tradition, to have been the capital of King Arimatta.* A similar but smaller fortification, about ten miles further on in the Kharija Belbari mauza, is known as the Phenguagarh. Prior to the earthquake of 1897 there was a very interesting stone bridge in Sila Sindurighopa mauza, about three miles from the Kamalpur rest house. It was 146 feet long, with 22 water ways, and the foot way was formed of solid blocks of stone supported on stone piers. Local tradition has it that it was built by Baktiar Khilji or Mir Jumla, *i e.*, by the first or by one of the last of the Muhammadan invaders of Kamrup, but Dr. Bloch is of opinion that it was the work of a Hindu architect. The bridge is now completely wrecked, but it lasted longer than the river it was built to cross, and at the present day there is no stream within three miles of it.

At Gauhati there are some fine carvings on the northern face of the rocks by the Brahmaputra below the Sukleswar temple. The principal image is that of Vishnu, and is sup-

* The villagers in the neighbourhood know very little about the fort. Some ascribe it to Bikramaditya, others talk vaguely of a raja and a princess with whom he had eloped, a reminiscence of the rape of Rukmini by Krishna.

ported on the right by Surjya and Gonesh, and on the left by Durga and another figure too mutilated to admit of its identification. The town itself bears all the signs of having originally been a place of much importance. The large tanks, and the remains of brick buildings which are found in every direction beneath the soil, suggest that it must have been a wealthy and a populous city, and on either side of the river there are earthworks linking up the gaps between the encircling hills which enclose a very considerable tract of land.

CHRONOLOGICAL TABLE.

AHOM KINGS.		MUHAMMADAN INVASIONS.	
A. D.		A. D.	
1228	Sukapha.	1204	Baktiar Khilji invades Assam.
1268	Sutenpha.	1220	Ghiyasud din Bahadur Shah advances to Sadiya, but is defeated.
1381	Subinpha.	1256	Iktiyarud-din Yuzbak Tughril Khan invades the Brahmaputra Valley, but is ultimately defeated.
1293	Sukangpha,	1337	Muhammed Shah sends a force "of 100,000 horsemen" into Assam, all of whom perish.
1332	Sukampha		
1364	Sutupha—treacherously killed by Chutiyas at a regatta held on the Sagrai river to celebrate a cessation of hostilities between the two tribes.		
1276-1380	Interregnum.		
1380	Sukemthi, a weak and tyrannical prince, assassinated by his ministers.		
1380-1398	Interregnum.		
1398	Sudangpha.		
1407	Siyangpha.		
1422	Suphukpha.		
1439	Susingpha—defeats Nagas.		
1488	Suhangpha—defeated by Kacharis in 1490, and murdered by a convict.		
1493	Supimpha, a cruel prince, assassinated by his ministers.		
1497	Suhunmung, alias Sarga Narayan or Dihingia Raja. Conquers Chutiyas and annexes their kingdom 1523. Repulses two Muhammadan invasions, the second being that under Turbuk in 1532, who was routed near the Bharell rivers. Kills Kachari king and sacks Dimapur, his capital, in 1536. Assassinated 1539.		
1539	Sukhenmung—built Gargaon (Nazira).	1509-1534	Viswa Singh—Founds Koch kingdom; advances against Ahoms, but was apparently defeated.
1552	Sukampha,	1534-1584	Nar Narayan—Conquers Ahoms and occupies Gargaon circa 1563 A. D. Subdues Raja of Cachar, Jaintia, Manipur, Tippera and Sylhet. Kala Pahar, invades Assam in 1563 and destroys temples at Kamakhya and Hajo.
1611	Suchengpha or Pratap Singh. Assists Bali Narayan against Musalmans, besieges Hajo, but is driven back. Bar Nadi accepted as frontier between Muhammadans and Ahoms in 1637.	1581-1593	Raghu Rai obtains share of Koch kingdom east of Sankosh.
1649	Surumpha. Deposed.		
1653	Suchingpha. Deposed.		

KOECH KINGS.

CHRONOLOGICAL TABLE.—Continued.

AHOM KINGS.		KOCH KINGS.	
A. D.		A. D.	
1654	Sutumla or Jaiyadwaj Singh, Ahoms occupy Goalpara 1658. Driven back by Mir Jumla, who enters Gargaon, 1661.	1603-1614	Parikshit—Builds North Gauhati, quarrels with his cousin Lakshmi Narayan, calls in Muhammadans to his aid.
1663	Chakradwaj. Ahoms reoccupy Gauhati in 1667.	1614-1637	Bali Narayan—Invokes aid of Ahoms against Muhammadans. From this date the Koch kings cease to be of any political importance.
1670	Adayaditya Singh—Assassinated.		
1672	Sukumppha—poisoned. Musalmans reoccupy Gauhati.		
1674	Suhung—Assassinated.		
1674	Teenkungiya—Assassinated.		
1674	Suhungpha—Blinded and murdered.		
1677	Sudinpha—Assassinated.		
1679	Sulekpha (Lora Raja)—Assassinated.		
1681	Gadadhar Singh—Ahoms recover possession of Gauhati.		
1695	Rudra Singh—Founds Rangpur, defeats Kachari and Jaintia Rajas, publicly adopts Hinduism as his religion. This period represents the height of the Ahom power. Dies at Gauhati.		
1714	Sib Singh—a weak prince, who resigned in favour of his wives. Excavated tank at Sibsagar.		
1744	Framatta Singh.		
1751	Rajeswar Singh. Decline of Ahom power.		
1769	Lakshmi Singh. Outbreak of Moamaria rebellion—king deposed for a time, but subsequently reinstated.		
1780	Gaurinath Singh. Driven to Gauhati by Moamaras. Reinstated by Captain Welsh in 1792, who is, however, recalled in 1794. Krishna Narayan Barrang Raja asserts his independence in 1792, but is defeated by Captain Welsh.		
1795	Kamalewar Singh. Deposes Krishna Narayan.		
1809	Chandra Kanta Singh—Burmese are invited into Assam by Bor Phukan. Deposed 1816.		
1816	Purandar Singh—Burmese again enter Assam. Deposed 1818.		

CHRONOLOGICAL TABLE.—*Concluded.***AHOM KINGS.**

A. D.	
1818	Chandra Kanta Singh—Burmese decline to leave. Chandra Kanta driven from Assam in 1820.
1824	War declared between British and Burmese Governments.
1826	Rangpur taken.
1826	Treaty of Yandaboo, by which Assam was ceded to the East India Company.

CHAPTER III.

THE PEOPLE.

Area and density—Variations in population—Migration—Sex—Marriage—Infirmities—Language—Castes—Religion—Temples—The Mahapurushias—Sattras—Muhammadanism—Animism—Buddhists—Christianity—Occupations—Marriage customs—Amusements and festivals.

Kamrup covers an area of 3,858 square miles and supports a denser population (153 to the square mile) than any other district in the Assam Valley. To the south the plain is much broken up by the outlying spurs of the Khasi Hills, and on this side of the Brahmaputra the population, except in the Palasbari tahsil, is comparatively sparse. In Boko, in the south-west corner, there were in 1901 only 71 persons to the square mile over a total area of 432 square miles, and in Chaygaon tahsil, lying east of Boko, there were only 104. North of the river, in the Gauhati subdivision, things are somewhat different. The central portion of the plain, which consists of the Hajo, Patidarang, Rangia, Nalbari, and Barama tahsils, is fairly densely peopled. Taken altogether these tahsils cover an area of 840 square miles, and in none of them was the density less than 300 to the square mile in 1901, while in Nalbari it was as much as 613, a figure which must be considered distinctly high for a purely rural tract. The highest point was reached in the Khata and Upar Barbhag mauzas, where, in 1901, there was a density

Area and
density.

of about 840 to the square mile. North of the Gohain Kamala Ali, population again falls off, as Hindus have a prejudice against settling on the further side of that road. It is said that the Koch king Nar Narayan (1534—1584 A.D.) declared that this should be the boundary between the Hindu territory and the country in which animistic rites might still be practised, and it is a fact that, not only in Kamrup, but in Mangaldai on the east and Goalpara on the west, the country at the foot of the Bhutan Hills has been almost entirely given up to the Bodo tribe. In the Tamulpur tahsil and the Bijni mauza, which covered an area of 707 square miles and occupied respectively the north-east and north-west corners of the district, there were only 57 persons to the square mile. Except in the Bajali tahsil the whole of the Barpeta subdivision is very sparsely peopled. Taken as a whole there were 91 persons to the square mile, and in Bagribari near the Brahmaputra the density sank as low as 8. The population and density of each tahsil or mauza in 1901 will be found in Table III.

**Towns and
villages.**

Kamrup contains two towns, Gauhati and Barpeta, and 1,716 villages. The villages are not, however, well defined units, clusters of huts which stand out clearly in the centre of the fields tilled by their inhabitants. Rice, the staple crop, is grown in wide plains, dotted over with clumps of bamboos and fruit trees in which are buried the houses of the cultivators. It is groves and not villages, that the traveller sees when riding through the more densely populated portions of the district, and not a house can usually be discerned till he has penetrated

this jungle of plantains, betelnut trees, and bamboos. There is generally no dearth of building sites, there are no communal lands, and there is nothing to keep the population together. Except in the Kachari duars, where the hamlets stand out more clearly on the grassy plains, it is difficult to tell where one village ends and another begins, or to which of the larger clumps of trees should be assigned the smaller clumps which are freely dotted about amongst the rice fields. The result is that the statistics of villages are of little practical importance; but, taking them for what they are worth, it appears that villages in Kamrup run small, as more than half the rural population in 1901 were living in hamlets with less than 500 inhabitants.

The first recorded estimate of the population was that furnished by Captain Bogle in 1835 * The statistics were collected by the chaudris, who had never before troubled themselves about acquiring knowledge of this nature, and were said to be seldom men of business or detail. The Collector observed that the population was undoubtedly much underrated, an uncivilized people having at all times an aversion to record the number of their families. The total returned was 243,317 souls, and it is evident that this estimate, and one quoted by Mr. Robinson in 1841 (271,944), † were much below the mark. Seven years later the population was reported to be 387,775. ‡ The centre of the district was said to be densely peopled, but

Growth of
population :
early esti-
mates.

* *Vide* his letter No. 16, dated 28th July 1835, to the Commissioner of Assam.

† A descriptive account of Assam, p. 282

‡ Report on Assam (Kamrup) by J. Moffatt Mills. Calcutta, 1854.

the fact that during the five years preceding Mr. Mills' visit there had been hardly any increase in the cultivated area and the land revenue demand suggests that the population had not been growing very rapidly. Cholera had for two years been ravaging the district; whole villages, according to the magistrate, had been depopulated, and in 1851 and 1852 upwards of 1,500 deaths occurred in Gauhati town alone.

Decrease of
population
between 1881
and 1901.

	Population.	Percentage variation	
1872	561,681		recorded in 1872, and at each
1881	644,960	+14.8	successive census. The cen-
1891	634,249	- 1.6	sus of 1872 was not a syn.
1901	589,167	- 7.1	chronous one; it is generally

supposed to have been incomplete, and the large increase that occurred during the next nine years was, in all probability, partly due to the superior accuracy of the enumeration of 1881. At the same time there can be little doubt that there was a substantial growth of the population during this period. The decrease that was disclosed in 1891 was largely due to the mortality from *kala azar* which entered the district in 1888. The nature and history of this disease is discussed in the medical section, and we are now only concerned with its effect upon the development of the population. *Kala azar* was most virulent in the country lying south of the Brahmaputra, and in this tract the population declined by nearly 12 per cent. North of the river the population increased by about 2 per cent. During the last intercensal period the mortality from fever and *kala azar* continued to be high, especially in 1892, 1896, and 1897, and there were had

outbreaks of cholera and smallpox. The result of all this sickness was that the census of 1901 disclosed a serious decrease in the population. The great earthquake affected cultivation by blocking the water channels and covering certain tracts with deposits of sand, and thus compelled a considerable number of persons to leave the district and seek a livelihood elsewhere. After allowing for this increase in emigration, it appeared that the number of persons born in the district and censused in the Province decreased by nearly 6 per cent. The injury done by the earthquake was especially pronounced in the Barpeta subdivision, and the gross decrease in this portion of Kamrup was no less than 14·5 per cent. In the sadr subdivision it was 5 per cent. The tracts which suffered most severely were the Hajo and Palasbari tahsils, which lie north and south of the Brahmaputra, a little to the west of Gauhati. In Hajo the decrease was as much as 18 per cent, but many of the people seem to have left their ruined rice fields and to have settled in the Rangia and Barama tahsils further north, and here the census actually disclosed an increase of the population. In Barpeta the mauzas near the river lost most heavily. In Bagribari there was a decrease of 77 and in Sarukhetri of 61 per cent, and the Bajali tahsil was the only place that showed an increase. It is satisfactory to know that the tide at last has turned, and that there has been an excess of births over deaths between 1899 and 1904.

The proportion of immigrants is lower in Kamrup than in any other district in the Plains of Assam, and in 1901

Immigra-
tion.

foreigners formed less than 3 per cent of the total population. The total number was 14,152, of whom 8,139 came from Bengal, the districts most strongly represented being Ranchi, the Sonthal Parganas, Saran, and Dacca. The tea industry is not of much importance in Kamrup, the gardens are largely worked with local labour, and barely one-fourth of these Bengalis were censused on the plantations. Other immigrants were Nepalese (1,559), who have settled down as graziers and in some cases as cultivators, the *kaiyas* or merchants from Rajputana (997), who are found in large numbers in Gauhati, and Bhutias, most of whom are temporary visitors who come down to trade in the cold weather, though there is one Bhutia village at Dewangiri which contains some seventeen houses. There are also a considerable number of natives of the United Provinces of Agra and Oudh (1,579), who are employed as carters, artisans, and coolies. A large proportion of these up-country men were censused in Gauhati town. Kamrup loses heavily by inter-district migration, and in 1901 only received 5,203 persons in place of the 25,835 born in Kamrup and censused in other parts of the Province. About 9,000 of these persons were found on the tea gardens of the four upper districts, and nearly 5,000 were censused in Goalpara. In the last named district the proportion between the sexes of the emigrants from Kamrup was fairly equal, so that in all probability they were ordinary cultivators who had moved across the boundary of the district, and were hardly emigrants in the sense in which that term is generally understood.

The figures in the margin show that the proportion of **Sex.**

Number of women to 1,000 men.

1872	...	...	919
1881	...	...	966
1891	...	...	976
1901	...	...	1,011

women has increased at each successive census, and that in 1901 they actually exceeded the men in numbers.

This, however, was solely due to the fact that the men when they go to Upper Assam generally leave their womenkind at home. Amongst those born in Kamrup and censused in the Province there were only 981 women to every thousand men as compared with 966 in 1891. Amongst the Hindus the proportion of the sexes was practically equal; amongst the Muhammadans the men were in a majority of 4 per cent; but amongst the animistic tribes there was a large surplus of women, due to the movement of the Kacharis to the tea plantations. The increase in the proportion of women has been ascribed to the greater resistant capacity of the so-called weaker sex in seasons of special unhealthiness, such as that from which the district has recently been suffering.

Infant marriage is unfortunately more prevalent than **Marriage.**

Percentage of Hindu girls married and widowed in ages

	0-10	10-15
Goalpara	4·8	62·4
Kamrup	1·5	23·9
Nowgong	0·2	10·5

in most of the districts of Assam Proper. The statement in the margin shows the percentage of Hindu girls

who have performed the marriage ceremony (a) under 10, and (b) between 10 and 15, in Goalpara, Kamrup, and Nowgong. In Goalpara as in Bengal "the healthy sense which bids the warrior races keep their girls at

home until they are fit to bear the burden of maternity seems to have been cast out by the demon of corrupt ceremonialism, ever ready to sacrifice helpless women and children to the tradition of a fancied orthodoxy."* The result is that a large proportion of little girls are hurried into matrimony long before their bodies are ready to support the strain it usually entails, and long before they are fitted to become the mothers of a healthy and a numerous progeny. In this respect Kamrup is better than Goalpara, but falls far short of the standard of excellence attained in the neighbouring district of Nowgong, where it is quite the exception to marry a girl before she is physically fit to undertake the functions of maternity. Another important feature of the matrimonial statistics is the proportion of potential mothers, under which head are classed married women between 15 and 40 years of age. Natural growth must largely depend upon this factor, and in this respect Kamrup is somewhat handicapped. In spite of the preponderance of women the proportion of potential mothers in 1901 was only 156 per mille, which is slightly lower than the proportion for the Province as a whole, and considerably lower than the proportion in the Central Provinces.

Infirmities.

Kamrup is fairly free from the two infirmities of in-				sanity and deaf-mutism, and the proportion afflicted in 1901 was considerably below
	Kamrup.	Assam.	India.	
Insane	4	5	3	
Deaf-mute	5	9	6	
Blind	12	10	12	
Lepers	14	13	5	

* Report on census of India for 1901, p. 433.

the average for the Province as a whole. The number of blind persons is, however, considerable, and the proportion of lepers exceeds the provincial average and is largely in excess of that for the whole of India. The statement in the margin shows the proportion per 10,000 afflicted in Kamrup, Assam and the Indian Empire as a whole. The figures refer to males only as the returns for females are, in the case of leprosy at any rate, not complete.

There is no district in the Province where Assamese ^{Language.} is so generally used as in Kamrup. In 1901 it was returned by 83 per cent of the population, but the dialect in vogue is not as pure as that which is spoken in Upper Assam. Eleven per cent of the people returned Bodo or Plains Kachari as their customary form of speech, but most of these tribesmen use Assamese in their intercourse with the outside world. Assamese is described by Mr. Grierson as the sister not the daughter of Bengali*. It comes from Bihar through Northern Bengal and not from Bengal Proper. The plural and feminine gender are formed in a different way from that in use in Bengali, and there is a considerable difference in the conjugation of the verb, in the idiom, the syntax, and even in the vocabulary. The pronunciation is also different, the Bengali sh being converted into h by the Assamese and ch into s. Kachari, or Bodo as it is more properly called, is a fairly rich language remarkable for the ease with which roots can be compounded together. A grammar of this language has been

*Report on census of India, 1901, Vol. I., d. 324.

published by the Rev. S. Endle*. Mikir is another indigenous language which is spoken by the tribesmen of that name who are found in the south of the Gauhati subdivision. It forms a link between Bodo and the Naga group of languages but is more closely connected with the latter.

**Caste and
race.**

Castes, which according to Assamese ideas are respectable, are more strongly represented in Kamrup than in any other district of the Brahmaputra Valley. The number of Brahmans is considerable, and forms about half the total number found in the whole division. After the Brahmans come the Ganaks, and two-fifths of the Ganaks of the Assam Valley were censused in Kamrup. Many of the Kayasthas are foreigners, but, in spite of its small foreign population, there are more Kayasthas in Kamrup than in any other district in the valley. It is, however, the Kalitas who give the touch of superiority to the district population. They represent the aristocracy amongst Assamese agriculturists, and more than half of the total number in the Province are found in this single district, where they form over a quarter of the total Hindu population. The Kewats, another reputable caste from whose hands a Brahman will take water, are found in considerable numbers, and there are other castes such as the Shaha and Saloi who enjoy this dignity. Respectability is, in fact, the keynote of the caste system in Kamrup. The Kacharis or Bodo, with their kinsfolk the Rabhas, are fairly strongly

* Shillong Secretariat Press, 1884.

represented, and there are naturally a large number of the Koch, the caste into which the Kachari is received on conversion. On the other hand, there are hardly any Ahoms or Chutiyas, the two race castes which are found in such numbers in Sibsagar and Lakhimpur. The European element in the population (64) is also small, the tea industry being of comparatively slight importance. In the following pages a short account is given of each of the castes which had 5,000 or more representatives in the district in 1901. An alphabetical glossary of all the castes of the Province will be found in the Census Report for that year.

The number of Brahmans in Kamrup is larger than **Brahmans.**

Males	...	...	11,399
Females	...	...	11,746

that in any other district of the Assam Valley. With the

exception of a few families they belong to the Kanna branch of the Jajur Veda, and owing to the absence of the divisions inaugurated at the time of Ballal Sen they are known as the Western Vedics. According to the Kalika Puran, colonies of Brahmans were settled in Kamrup by Narak Asura before the war of the Mahabharata, and local tradition has it that the 72 Brahman families of Soalkuchi were present at the *sradh* ceremony of Bhagadatta, Narak's son. This is, of course, tradition and nothing more, but it seems fairly clear that Brahmans were settled in Kamrup from a very early period. Barbhag, Banbhag, and Barigog, three mauzas all within a few miles of Nalbari village, are the chief centres of the Brahman population, and there are considerable numbers of this aristocratic caste at

Pokoa and Dharmapur in Nalbari, and at Sila in the Barpeta mauza. Most of them make their living as cultivators, though they are, of course, obliged to get the actual ploughing done by others, and a considerable number go to Kuch Bihar and Eastern Bengal in search of work as priests, or, failing this more respectable calling, as simple cooks.

Garos.

The Garos are a tribe of Bodo origin, the bulk of whom are to be found in the hills that bear their name.

Males	...	...	2,527
Females	...	...	2,617

According to their own traditions they came originally from Thibet and settled in Kuch Bihar. From there they were driven to Jogighopa, and thence to Gauhati, where they were enslaved by the Assamese. They were, however, delivered by a Khasi prince, and then travelled *via* Boko to the Garo Hills. Most of the Garos are to be found in the hilly country on the outskirts of the Khasi Hills. They live in better style than many of the hill tribes, and are to some extent differentiated from other members of the Bodo family by the good position accorded to their women and the extraordinary scantiness of the national costume. A full account of the manners and customs of the Garos will be found in the Monograph on the Garo tribe.

Jugis.

The Jugis are a low caste whose traditional occupation is weaving, and who are looked down upon by their superiors in the social scale. Like other humble castes they lay claim to a high origin. According to one account

Males	...	...	8,636
Females	...	...	8,818

they are the offspring of Brahman widows and ascetics, while others assert that they are descended from Gorakshanath, who was an incarnation of Siva. A few years ago the Jugis at Barpeta assumed the sacred thread, at the instigation of a Brahman priest, and declared themselves to be gentlefolk. It was suggested to them that they should prove their good position by requiring their priest to marry a Jugi girl; but the Brahman fled as soon as this proposal was made to him. Their attempt to raise themselves in the social scale was thus an utter failure, and they were entirely excluded from the *namghor*, though previously they had been allowed to enter the outer room.

The Kacharis or Bara (mispronounced Bodo), as they Kacharis
their origin.

Males	...	...	43,122
Females	...	...	48,982

 call themselves, belong to the great Bodo tribe, which

is found, not only in the Brahmaputra Valley, but in the Garo Hills and in Hill Tippera, south of the Surma Valley. It is generally supposed that they are a section of the Indo-Chinese race, whose original habitat was somewhere between the upper water of the Yang-tse-kiang and the Hoang-ho, and that they gradually spread in successive waves of immigration over the greater part of what is now the Province of Assam. This theory has much to recommend it and is to some extent confirmed by a prayer which is in use amongst the Dimasa* in the North Cachar Hills. This prayer refers to a huge peupul tree growing near the confluence of the Dilao (Brahma-

*The Dimasa are the section of the Kacharis who live in the Cachar district.

putra) and the Sagi. There the Kacharis were born and increased greatly in numbers and thence they travelled by land and water till they reached Nilachal, the hill on which the temple of Kamakhya stands, in Kamrup. From Gauhati they migrated to Halali and finally settled in Dimapur. The inscriptions recorded on copper plates in the tenth and eleventh centuries A. D. refer to the conquest of Kamarupa by a foreign dynasty which was subsequently replaced by a king of the line of Narak*. It is possible that the Kacharis were the invading force, and on their expulsion from Gauhati they might not unnaturally have retreated towards the Dhansiri valley.

No connection between Kacharis of Kamrup and Dimapur.

The Kachari kingdom was one of the strongest powers with which the Ahoms were confronted when they entered the valley of the Brahmaputra. Their capital was located at Dimapur on the Dhansiri river, and at one time they were in possession of the western part of Sibsagar, and the greater part of the Nowgong district. Dimapur was sacked by the Ahoms in 1536, and the Kachari king was compelled to move his capital to Maibang. Subsequently they migrated to the plains of Cachar, and the last representative of the line was assassinated there in 1830. It seems, however, doubtful whether the Kacharis who live on the north bank of the Brahmaputra were ever in any way connected with the king of Dimapur. The one tribe style themselves Bara, the other Dimasa, and, though both use languages of Bodo origin, the difference between plains Kachari and Dimasa is greater

* *Vide* J. A. S. B., Vol. LXVII, Part 1, No. 1, 1898, page 99.

than that between French and Spanish. The two tribes sprang no doubt from the same stock, but there is no evidence to show that they were ever united by the tie of a common nationality, or that the Kacharis of Kamrup were more closely connected with the Kacharis of North Cachar, than are the Rabhas and Lalungs.

The following legend is prevalent amongst the Dimasa. Dimasa legend of the separation of the two tribes. It would account for the separation of the Bodo and Dimasa, but no traces of the story have been found amongst the Kacharis of Kamrup.

“Long ago the Dimasa fought against a powerful tribe and were beaten in a pitched battle. They were compelled to give ground, but after a time further retreat was barred by a wide and deep river. In despair the king resolved to fight again on the following day; but in the night a god appeared to him and told him that the next morning the army could cross the river if they entered it at a spot where they saw a heron standing on the bank. No one, however, was to look back while the movement was in progress. The dream proved true. A heron was seen standing on the bank, and the king and a great portion of his people crossed in safety. A man then turned to see whether his son was following, when the waters suddenly rose and swept away those who were in the river bed and prevented the others from crossing. The Dimasa were those who succeeded in reaching the further bank in safety.”

The ordinary Kachari of Kamrup is an illiterate villager who has only vaguely heard of the Kacharis of Nowgong, but knows that their language differs slightly from his own. He is quite innocent of history, has never heard of the Kachari raj, and as a source of information of anything prior to the immediate present is absolutely useless.

At the present day the tribe is not split up into any endogamous or exogamous subdivisions. Their social Social position and distribution of Kacharis.

position is of course low, but the Hindu gosains are willing to receive them as their disciples, and, if they are prepared to abandon their pork and beer, will even enrol them as members of the Koch caste. The bulk of the Kacharis live on the grassy plains at the foot of the Himalayas, and are especially numerous in the Rangia, Tamulpur, Barama and Bajali tahsils. Their villages are surrounded with fences, but present a dirty and untidy appearance, as pigs and fowls are allowed to wander about in every direction. Agriculture is their normal occupation, and rice the staple crop grown. They are fully alive to the advantages of irrigation, and conduct the water of the hill streams on to their fields through little artificial channels which are made by the combined labour of the villagers. But, though efficient agriculturists, they have not that contempt for daily labour which is so marked a characteristic of the Assamese. They readily take work on tea gardens, and in 1901 nearly 14,000 Kacharis were censused on the plantations. Though still using their tribal form of speech in their own villages, most of them can speak and understand Assamese.

Religion.

Their religion is of the ordinary animistic type, and is mainly concerned with the propitiation of the various devils who are the source of all their trouble. The principal god is called Siju and is represented by the cactus which is seen growing in the courtyard of every house. He is worshipped twice a year, at the time when the summer and winter rice are harvested, and is said to punish those who neglect this ceremony with an early death. The following is a list of some of the principal demons.

Buna, habitat uncertain, causes madness. Kabir, lives in trees, kills cattle and men by some form of rapid illness that attacks their chests and causes them to spit blood. Pani-debota, lives in water, causes rheumatism, is propitiated by one duck, one pair pigeons, four small fowls, unripe plantains, vermilion and tamul pan. These dainties are set afloat on a raft made of four plantain trunks fastened together, and it is to be hoped that the god is pleased. Pikhas, habitat uncertain, sends fever and is propitiated with one large fowl, seven small, one vessel of rice beer, and one pair of pigeons. Bira is another unpleasant deity who drives people, especially women, mad, and sets fire to houses. When elephants eat the dhan there is puja to the Buragohain or Siju, and when tigers kill the cattle to the goddess of tigers. Difficult labour, strangely enough, does not seem to be ascribed to the malignant action of any demon. It is treated with village remedies which, though probably of little use, cannot be less effectual than the pujas prescribed in other and less serious cases. When there is any uncertainty as to the particular deity responsible, an *ojha*, or wise man, is called in, who throws a handful of cowries on the ground, and from them receives a "sign," which enables him to ascertain the special puja necessary.

The Kacharis of Kamrup sometimes bury their dead, sometimes simply throw them into the jungle, and the funeral, as is generally the case amongst primitive tribes, is accompanied with a good deal of feasting. Girls are hardly ever married before they are fully grown, and

Funeral and
marriage
customs
of Kacharis.

cost from Rs. 60 to Rs. 150. If the lover cannot obtain this sum he goes to the house of his father-in-law and works for him, and after five years' labour is allowed to remove his bride. Pregnancy prior to marriage does not entail any social disability provided that the father of the child is of the same caste. If the man declines to marry his mistress he is fined a pig, but if he is willing to take her he pays the bride price or works for her in the ordinary way. Others say that an illegitimate child can only pay its way into the tribe at the cost of thirty or forty rupees' worth of rice, pork, and liquor. If the pater-nity is admitted this feast is given by the father, but, when the unfortunate girl is unable to induce her lover to acknowledge his own offspring, the maternal grandfather is held responsible.

Kalita.

The following account of the Kalitas is taken from the Census Report of 1901 :—

“There is much uncertainty as to the origin of this caste. The

Males	...	58,545	popular explanation is that Kalitas
Females	...	57,045	are Kshatriyas, who, fleeing from

the wrath of Parasu Ram, concealed their caste and their persons in the jungles of Assam, and were thus called Kullupta. Other theories are that they are Kayasthas degraded for having taken to cultivation, an explanation which in itself seems somewhat improbable, and is not supported, as far as I am aware, by any evidence, or that they are the old priestly caste of the Bodo tribe. The latter theory can hardly be said to account for their origin, and though it is possible that Kalitas may have originally acted as priests this fact throws little or no light on the problem of what the Kalitas are. The most plausible suggestion is that they are the remains of an Aryan colony, who settled in Assam at a time when the functional castes were still unknown in Bengal, and that the word ‘Kalita’ was originally applied to all Aryans who were not Brahmans. The Kalitas are divided into two main subdivisions, Bar and Saru, and into a number of professional

sub-castes. In Upper Assam, Bar Kalitas are said to decline to use the plough, though they occasionally work with the spade, but there is no such restriction in Kamrup, where the great bulk of the caste is found. Cultivation is, in fact, the traditional occupation of the caste, and they even consent to work as coolies on tea gardens. The usual procedure for a Kalita who has succeeded in rising above the necessity for manual labour, and is no longer compelled to follow the plough, is to call himself a Kaist or Kayastha. Two explanations are given of the origin of the Saru Kalita—one that he is the offspring of persons who for three generations back have not been united by the ' *hom* ' ceremony, the other that he is the child of a Bar Kalita and a Kewat woman. Whether the Bar Kalita can intermarry with, and eat *kuchchi* with, the Saru Kalita seems open to question, and the practice apparently varies in different districts; but there seems to be no doubt that the functional subdivisions of the caste are debarred from the privilege of close intercourse with the Bar Kalita. These subdivisions are the Mali, Sonari, Kamar, Kumhar, Napit, Nát, Suri and Dhoba. The first two inter-marry with the Saru Kalita and also with the Kamar Kalita. The last four groups are endogamous. All these functional groups are to some extent looked down upon, probably because followers of these professions, who were not true Kalitas, have occasionally succeeded in obtaining admission within their ranks; but the goldsmiths, from their wealth, have secured a good position in society. Kalitas have a good Brahman for their priest, and their water is taken by every caste, a fact which no doubt explains the high value attached to Kalita slaves in the time of the Assam Rajas, when two Koches could be purchased for the price of a single Kalita, though the Koch is generally the hardier and stonger man of the two."

Early marriage is common in Goalpara, but not in Assam Proper, except amongst the upper sections of the caste. They take, in fact, a liberal view of the relations between the sexes, and cohabitation is the essential part of marriage. Well-to-do Kalitas are invariably united by the *hompura* rite and employ a Brahman, but the poorer people often content themselves with the *agchauldia* or *juron* ceremonies, which consist of a feast to the villagers and a public acknowledgment of the

position of the bride. Some authorities hold that this, though a valid form of marriage for the lower Assamese castes, is not sufficient for the Kalita. They regard the *hompura* rite as the one essential ceremony of purification, but it can be performed after cohabitation has begun, and sometimes takes place after the death of the husband. An unmarried girl who becomes pregnant does not forfeit her position in society, unless her lover is of a lower caste. The Kalitas are distributed all over the district, but are not numerous north of the Gohain Kamala Ali, or near Boko in the south-west corner of Kamrup.

Kayasthas.

Many of the Kayasthas are foreigners, and a considerable proportion of them earn their living as clerks or officers in the employ of Government. Kalitas who have risen above the necessity of manual labour frequently describe themselves as Kayasthas.

Males	...	...	2,348
Females	...	...	1,974

Kewats.

The Kewats are a respectable Hindu caste, from whose hands Brahmans will take water, and who according to Assamese ideas rank immediately after the Kalita. These remarks only hold good, however, of the Halwa or cultivating Kewats. The Jaliya, or fishing subdivision of the caste, occupy a very humble position in the social scale, and are considered little better than Nadiyals. The two sections of the caste have nothing whatever in common except the name Kewat or Kaibartta, but the number of Jaliya Kewats is comparatively small. The Nadiyals have of recent years laid claim to the title of Jaliya Kai-

Males	...	...	21,415
Females	...	...	23,059

bartta, and the Halwa Kewats are so afraid of being in any way connected with such people or with the fishing subdivision of their own caste, that, in Barpeta, they have assumed the somewhat fanciful title of Maheshya Vaisya.

The Koches are one of the race castes of Assam. Koches.

Males	...	...	47,210
Females	...	...	46,743

Originally they were an aboriginal tribe, apparently of Mongolian origin, which, at the beginning of the sixteenth century, rose to power under their great leader Viswa Singh. His son, Nar Narayan, extended his conquests as far as Upper Assam, Tippera, and Manipur, and by the middle of the sixteenth century, the Koch king had attained to a position of such power that the aboriginal people were anxious to be enrolled as members of his tribe. The result is that, at the present day, the name is no longer that of a tribe but of a caste into which new converts to Hinduism are enrolled. In Sibsagar and Lakhimpur these converts still retain their tribal names, and the Koch is a respectable Sudra caste, which is not broken up into various subdivisions. This is not the case in Lower Assam, and the different groups are there allotted a different status, which is dependent on the time that has elapsed since conversion took place and the extent to which aboriginal habits have been shaken off. The principal subdivision is the Bar Koch, who are looked upon as a clean Sudra caste, and from whose hands Brahmans will take water. The same distinction is not accorded to the Saru Koch, though they conform in most essentials to the somewhat lax standard of Hinduism exacted in Assam. Three other subdivisions are

graded in accordance with the extent to which they have forsworn the attractions of unconverted life. The Kamtali abstain from intoxicating liquor and usually from pork, the Hiremia still keep pigs but no longer indulge in the use of liquor, while the Madahi are Hindus only to the extent of having taken *saran*, and still permit themselves great freedom in all matters of food and drink.

Kumhars.

Kumhars are by tradition potters, but, like so many of the functional castes in Assam, they have to a great extent abandoned their traditional occupation in favour of agriculture.

Males	...	...	3,345
Females	...	...	3,333

Mikirs.

According to Colonel Dalton the Mikirs were originally settled in the North Cachar Hills, but were driven westward into Jaintia territory by the Kacharis. Dissatisfied with the reception accorded to them there, they sent an embassy to the Ahom governor at Raha, offering to place themselves under the protection of his master. But, as the luckless delegates were unable to make themselves understood, they were forthwith buried alive in a tank which that officer happened to be excavating. Hostilities ensued, but the Mikirs were soon suppressed, and were settled in the hills that bear their name, though a considerable colony are still to be found in South Kamrup and the northern slopes of the Khasi Hills. They are divided into four tribes Chintong, Ronghang, Amri, and Dumrali, and these tribes are again subdivided into various

Males	...	...	5,431
Females	...	...	5,162

exogamous groups. In the hills the Mikirs live by *jhum* or shifting cultivation, and raise crops of cotton, chillies, rice, and vegetables. All the members of a family live in one house, which is thus of considerable size. Their religion is of the usual animistic type, and is chiefly concerned with the propitiation of evil spirits. Infant marriage is unknown and sexual license within the tribe prior to marriage is tolerated.

The Doms, or, as they prefer to call themselves, Nadi- The Nadi-
yals. yals, are the boating and

Males	...	...	5,196
Females	...	...	5,322

fishing caste of Assam. They are anxious to assume the name Jaliya Kaibartta, but the Kaibarttas are unquestionably a different caste, though their manners and customs do not differ materially from those of the Assamese Nadiyal, except in the following particular. The Kaibarttas decline to use the *ghokota* net, and in theory only sell their fish on the river's bank within a paddle's throw of the boat, whereas the Nadiyals regularly take their catch to market. The Nadiyals are probably descended from the aboriginal race of Doms, the ruins of whose forts are still to be seen in India, but migrated to Assam before the Dom caste had been assigned the degrading functions now performed by them in Bengal. They are cleanly in their habits and particular in their observance of the dictates of the Hindu religion, and account for the objectionable name "Dom," which undoubtedly they have borne for centuries, by saying that they were the last of the Assamese to be converted from Buddhism. They are

darker in complexion than most of the Assamese, but have a good physique, and by no means uncomely faces. Their women are most prolific, and the Dom villages are full of fat brown babies. They rank very low in the social scale, and, according to Assamese ideas, are superior only to the Brittil Baniya or Hari. The bulk of the caste still live by fishing, and education has made but little progress among them. Marriage does not take place till the girl is fully grown, and they are free from any puritanical notions with regard to the relations between the sexes. Their priests are said to be descended from a Brahman father and Nadiyal mother, but for all practical purposes they are Nadiyals and inter-marry with Nadiyal girls.

**Namasudra
or Chandal.**

The Namasudras are a boating and fishing caste, said by Manu to have sprung from the union of a Brahman woman with a Sudra, and therefore to be the lowest of the low. They are a cheerful and hardworking people, but are heartily despised by their Hindu neighbours, and a degraded Brahman acts as their priest. A section of the Chandals has formed itself into a separate caste called Hira. They work as potters, but do not use the wheel, laying on the clay in strips. Many of the Chandals have now taken to agriculture as their occupation. A large proportion of the Namasudras were censused in the Hajo and Nalbari tahsils.

Males	...	...	5,370

tors pure and simple and have exchanged the barber's razor for the plough.

The Rabhas are a section of the Bodo race and appear **Rabhas.**

Males	...	...	8,039	to be an offshoot of the Garos
Females	...	...	8,302	Their language is closely akin

to Garo, and their original habitat seems to have been the northern slopes of the Garo Hills. Certain sections of the tribe, which live on the borders of that district, have no word for north and south, but describe the former idea by Bhutan, the latter by Tura, a fact which pretty clearly indicates the locality from which they originally came. Most of the Rabhas have, however, left their ancestral home and settled in Darrang, Kamrup, and Goalpara. In the last named district the bulk of the tribe are to be found south of the Brahmaputra. The Rabhas are divided into the following seven sections—Rangdania, Pati, Maitariya, Koch, Bitlia, Dahuria, Sangha. The Rangdania lay claim to a position of superiority, but inter-marriage is allowed with the Patis and Maitariyas. Inter-marriage between the first three sections and the lower subdivisions of the caste is permitted, but only on payment of a fine of about Rs.100.

The Saloi are supposed to be an offshoot from the **The Saloi.**

Males	...	...	3,637	Halwai or confectioner caste,
Females	...	...	3,789	but in Kamrup they have

taken to agriculture. They are classed as a clean Sudra caste from whose hands Brahmans can take water, and rank above the Shahas but below the Kewats.

**The Shaha
or Shau.**

The Shaha are, theoretically, a sub-caste of Sunris or liquor-sellers, and, as such, occupy a very humble position in society. But, in Kamrup, they have taken to agriculture, and have succeeded in getting accepted as a clean Sudra caste from whose hands a Brahman can take water.

Males	...	...	6,751
Females	...	...	7,329

The Totlas.

The Totlas are a superior section of the Kacharis, and occupy an intermediate position between the Kachari and the Koch. They are said to be abandoning pork and fowls as articles of food, but still take liquor.

Males	...	...	3,438
Females	...	...	3,577

Religion.

Classified by religion the population of Kamrup in 1901 was distributed in the following proportions: Hindus 69 per cent, Animistic tribes 21 per cent, and Muhammadans 9 per cent. Hindus, again, are divided into three main sects, Saktists, who devote particular attention to the reproductive powers as manifested in the female, Sivaïtes, whose special deity is Siva, as represented by the phallus, and Vaishnavites, who worship Krishna. Some account of the Saktist creed will be found in the Census Report of 1901, and more detailed information will be found in "Hindu Castes and Sects" by Babu Jogendra Nath Bhattacharya, M. A., D. L., President of the College of Pandits, Nadiya. The Saktist creed is a matter of general and not merely local importance, and need not be described at length in a District Gazetteer. In spite of the fact that Kamrup is said to have been the cradle of the Tantrik rites, and that it contains, in Kamakhya, a

shrine which occupies a position of peculiar sanctity in the estimation of the Saktist community, the Saktists in 1901 formed less than 2 per cent of the total Hindu population of the district. Sivaitism was still more poorly represented, and only 573 persons in that year professed their adherence to the special mantra of Mahadeo.

There are no less than thirty-three temples in Kamrup **Temples.** supported by grants of revenue-free or *nisfi-khiraj* land, without counting the fourteen smaller temples on the sacred hill of Nilachal, and the six temples in other parts of the district which have no regular endowment. The names of these temples, the mauzas in which they are situated, the area of their grants, the names of their founders and the date of the foundation, where known, will be found in a statement appended to this chapter. The two oldest, and by far the wealthiest and the most important, are the temples at Kamakhya and at Hajo. None of the others are known to date back further than the eighteenth century A. D., and, of the twenty-six temples for which particulars are available, no less than twelve were founded by Sib Singh, who reigned from 1714 to 1744 A. D.

Kamakhya is a place of pilgrimage visited by Hindus **Kamakhya.** from every part of India. Of all the 51 *piths*, or places at which a portion of Sati's dismembered body fell, it is probably the most interesting and important, as the relic, concealed within the penetralia of the shrine, is no less a thing than the pudenda of the goddess. A temple is said to have been first erected by Narak in the heroic

period of the Mahabharata. In the course of ages the building disappeared, and even the legend of the shrine and its associations was forgotten, and it was reserved for Viswa Singh to re-discover this holy spot. He built a temple on the hill, but it was shortly afterwards destroyed by the Muhammadan fanatic Kala Pahar. In 1565 A. D. the temple was re-built by Nar Narayan, and was consecrated by a whole hecatomb of victims, including 140 men, whose heads were offered on copper plates to the goddess.* The basement of the existing temple, which is made of hewn stone, dates back to the time of Nar Narayan, but the superstructure is of more recent date. The dome is egg-shaped and is surrounded with little turrets. The temple as a whole is in excellent repair, and is remarkable for some curious bas-reliefs inserted in the wall, and for a row of statues of considerable size around the shrine. The other buildings on the hill are comparatively modern, and most of them were re-erected by the Maharaja of Darbhanga after the earthquake of 1897.

Beauty of
the Nilachal
hill.

But, though lacking in interest to the archæologist, Kamakhya should be visited by every lover of the picturesque. A paved causeway, which tradition says was constructed by Narak thousands of years ago, stretches from the trunk road to the spur on which the temple stands. The path is steep, and the rocks have been worn to a slippery smoothness by the feet

* *Vide* the Koch kings of Kamrup, by E. A. Gait, J.A.S.B., Vol. LXII, Part I, No. 4, 1893.

of generations of pilgrims. The sides of the hill are rocky, in places even precipitous, but, wherever they can find a foothold, the giants of the forest have driven their roots into the earth, and huge pekul and rubber trees cast their shadows over the path. At either end it passes through an archway of fine masonry, and here and there the rocks along the side have been hewn into the semblance of quaint Hindu gods. From the summit of the hill there is a magnificent view over the surrounding country. Its feet are washed by the mighty Brahmaputra, whose channel at this point is shut in by rocks on either hand. To the south there are the tumbled masses of the Khasi Hills, rising out of the alluvium as cliffs rise out of the sea, the flat and fertile valleys, with which they are intersected, forming a striking contrast to their precipitous and jungle covered sides. On the north are fields of golden rice and yellow mustard, groves of palms and feathery bamboos, surrounded and enclosed by rocky hills, while far away in the distance are the blue ranges of Bhutan and the snowy peaks beyond.

The temple at Hajo is an object of veneration to Bud-^{Hajo.}dhists as well as to Hindus. It stands on the summit of a low hill and is approached by a long flight of steps. It is said to have been originally built by Ubo Rishi, and to have been restored by the Koch king Raghu Rai in 1583. A. D., after it had been damaged by the Muhammadans. The image in the shrine is a representation of the man-lion incarnation of Vishnu, but it is worshipped by the Bhutias under the erroneous impression that it is a statue of Buddha. The exterior wall of the temple is

adorned with bas-reliefs, and a dado of elephants runs round the dome. Hajo possesses a grant of more than 12,000 acres of revenue-free land, and a staff of dancing girls, an appurtenance which is not enjoyed by any other religious institution in Assam.

Other temples.

The other temples are all built after the usual Ahom pattern, and consist of a dome enclosing the shrine approached by a small nave. The material used is thin glazed brick, burnt almost to the consistency of pottery, and the dome is generally adorned with stone bas-reliefs let into the wall. Gauhati itself is well supplied with temples. There are three, all in a more or less ruinous condition, west of the hill on which the bungalow of the Deputy Commissioner stands. There is another on the island of Umananda in the middle of the Brahmaputra, while on the north bank, the temple of Aswakranta stands on a rocky promontory and is approached by a long flight of steps. Krishna, so the story goes, halted here with Rukmini, and the holes now visible in the rocks are said to have been made by his horse's hoofs. A small island near the shore also owes its origin to Krishna, who created it to screen Rukmini when bathing, from the curious eyes of the people on the further bank. A little to the east of the club are the temple and tank of Ugratara, and beyond Ujan bazar is the temple of Chhatrakar. The dome is but a small one, but the walls are seven or eight feet thick, and are composed of layer upon layer of native bricks. The most interesting temple near Gauhati is, however, the one sacred to the

;

Navagraha or nine planets. It stands on the summit of a low hill east of the town, and the roof of the dome has completely disappeared. Looking down from above on to the floor of this open cockpit, one sees the altars of the sun and moon and seven of the planets. Each is represented by a *lingum* and *jonipthi* in conjunction, and is draped with cloth and adorned with flowers by the attendant priest. Nine miles south of Gauhati is the temple of Basistha. The building itself has little to recommend it, and is in a very ruinous condition, but it stands amongst the most romantic and picturesque surroundings. It overhangs a mountain stream which comes roaring down over huge rocks and boulders, and is shut in on every side by hills. The temple was erected in 1751 A. D. in honour of the great Rishi Basistha, who is said to have spent some time in this charming valley. Rudreswar is another temple near Gauhati which has historical associations. It was erected by Sib Singh in memory of his father the great Rudra Singh, who died at Gauhati in 1714 A. D., and differs from most of the temples in the district in that it is built on a vaulted plinth.

A considerable number of Hindus did not attempt to specify their sect in 1901, but of those who committed themselves to this extent, nearly 98 per cent declared their adherence to Vaishnavism. This form of Hinduism is thus described in the Assam Census Report for 1901 :

“Sankar Deb, the apostle of Vaishnavism in Assam, was born in 1449 A.D., and was the descendant of a Kayastha, who according to tradition had been sent, with six of his caste fellows and seven Brahmans, to Assam by the King of Kanaijpur as a substitute for the Assamese prime minister, who had fled to his

court for refuge. The licentious rites of Saktism had aroused his aversion while he was still a boy, and his desire to found a purer system of religion was increased by the teachings of Chaitanya in Bengal. Like most reformers, he met with vehement opposition from the supporters of the established order, and he was compelled to leave his home in Nowgong and to fly to the inhospitable jungles of the Barpeta subdivision, where, in conjunction with his disciple, Madhab Deb, he founded the Mahapurushia sect, the main tenets of which are the prohibition of idolatry and sacrifice, disregard of caste and the worship of God by hymns and prayers only. Sankar himself was, like a true follower of Chaitanya, a vegetarian, but the low-caste people, who formed a large proportion of his converts, found this injunction a counsel of perfection, and the Mahapurushias are accordingly allowed to eat the flesh of game, but not of domesticated animals, though, with a subtlety only too common in this country, they observe the letter of the law, prohibiting the spilling of blood, by beating their victims to death. The great centre of the Mahapurushia faith is the Sattrā at Barpeta, where a large number of persons persist in living huddled together, in defiance of all the laws of sanitation, and resist with surprising pertinacity all efforts to improve their condition. They are a peculiarly bigoted people, and are strongly opposed to vaccination, with the result that the mortality from smallpox in the neighbourhood of the Sattrā is exceptionally high. It was not long, however, before the Brahmans re-asserted their influence, and shortly after Sankar's death, two of his followers, who were members of this caste, established sects called, after their founders, Damodariya and Hari Deb Panthi, which are distinguished from the Mahapurushias by the respect paid to the distinctions of caste and a certain tolerance of idolatry. A fourth sect was founded by one Gopal Deb, but it originally seems to have differed in no way from the Mahapurushia creed, and subsequently its followers adopted the teachings of Deb Damodar. There is, in fact, practically no distinction between the Damodariyas, the Hari Deb Panthis, and the Gopal Deb Panthis, and the Vaishnavites of the Assam Valley can be divided into the Mahapurushia and Bamunia or 'other Vaishnavas,' as they have been called in the census tables. The former will accept a Sudra as a religious guide, worship no god but Krishna, and are uncompromising in their hostility to idols; the latter will only recognise Brahmans as their gosains, permit the adoration of other deities, such as Siva and Kali, in addition to that of Krishna, and allow sacrifices to be offered in their honour."

The Bamunias are also more liberal in their diet, and will eat goats, pigeons, and ducks, a form of food that is not allowed to orthodox Vaishnavites in Bengal. Madhab Deb, like most religious reformers, was a strict disciplinarian. The story goes that the breach between him and Gopal Deb arose one stormy day when the party were returning to Barpeta by boat. Gopal Deb, anxious for the safety of his teacher, apostrophised the storm clouds passing overhead, and begged them to restrain their fury till Madhab had reached the shore in safety. This innocent remark was construed into an invocation of Varuna, the god of rain. Gopal Deb was denounced as an idolater, and was incontinently, by order of Madhab, flung out of the boat. Such treatment was enough to damp the enthusiasm of the most ardent disciple. Gopal Deb, wallowing in the water, gallantly shouted out defiance to his former leader, and warned him that in future he would be treated with uncompromising opposition. Twenty-one per cent of the Vaishnavites in Kamrup in 1901 were said to be members of the Mahapurushia sect, but it would be unsafe to put much reliance on these figures.

A special feature of Vaishnavism in Assam are the *sattras*.^{sattras.} These *sattras* are small communities, resembling in some respects the monasteries of Mediæval Europe, but with this important difference that celibacy is not invariably regarded as a requisite. The central feature of the

sattra is the *namghar*, a large barn-like hall in which the people assemble for religious worship, and at the further end of which there is frequently a shrine enclosing an image of Vishnu in one of his numerous incarnations. Round this hall are ranged the houses of the resident disciples, and in Sibsagar the larger *sattras* are places of much dignity and wealth. There are no less than 56 *sattras* in Kamrup, but nearly all of them are small and unimportant. Those which are held in most respect are a branch of the great Auniati *sattra* near Gauhati, the Patbausi *sattra* near Barpeta, the Nij Patbausi and Sundaridia *sattra* in the same locality, the Chamaria *sattra* in Paschim Chamaria, the Khidirpukhri, Manpur, and Nahira *sattras* in Chayani, and the Baniyakuchi *sattra* in Sorukhetri. But all of these *sattras* are completely overshadowed by the famous institution at Barpeta.

The kirtong-
har at Bar-
peta.

The *kirtonghar* at Barpeta stands in a compound about two acres in extent. On the north and south this compound is shut in by the lines occupied by the *keolia bhokots*, or resident disciples, while on the two remaining sides it is enclosed by a brick wall. The *kirtonghar* itself is a large building, 180 ft. by 60ft., with walls of brick and roof of corrugated iron. Adjoining is the *bhojghar*, which contains two idols, the *Kolia Thakur* and the *Dol Gobinda*, which are regarded as the presiding deities of the place, and various relics of Sankar Deb and Madhab Deb, such as *puthis*, hair, and stones bearing the impress of their feet. An oil lamp is kept continually burning before the idols, and if it flickers or goes out it is considered to be a

sign that trouble is coming to the *sattrā*. Close by there are two small buildings called Bura Ata's *bheti*, and Badla Ata's *bheti*. Bura Ata was the first gosain who received charge of the *sattrā* from Madhab Deb. The other *bheti* is sacred from its associations with Badla Ata, the founder of the Kamalabari *sattrā* on the Majuli. The southern verandah of the *kirtonghar* is reserved for the use of the female devotees, who take part in the service but are not allowed to enter the actual hall itself.

A list of the different *sattras* in Kamrup will be found appended to this chapter. None of these institutions have, however, any considerable body of disciples, and a large proportion of the Bamunia Vaishnavites of Kamrup are the followers of the great gosains of the Majuli, whose *sattras* are described in the Gazetteer of the Sibsagar district. The disciple every year makes an offering to his gosain, which varies from four annas to one rupee a head. These sums are collected by the *medhis* or local agents of these holy men, and by them conveyed to the *sattrā*. The *medhi* is generally a person of considerable influence in the village, he is exempted from making any personal contribution, and he receives a small fee on the occasion of the burning of any of his co-disciples.

Though the Muhammadans never succeeded in retain-
ing their hold upon Kamrup for any length of time, they ^{Muhammad-}
were on more than one occasion in possession of Gauhati, ^{anism.}
and the proportion of Musalmans (9 per cent), though considerably lower than that in Goalpara, is higher than in any other district of Assam Proper. Most of them are

found in the sadr subdivision, and they are especially numerous in the four tahsils which lie opposite Gauhati, i.e., Hajo, Patidarang, Rangia and Nalbari.

**Three classes
of Muham-
madans.**

The Muhammadans of the district fall into three main classes. The *nagarias* or townsfolk are usually artizans, and those amongst them who are Assamese profess to be the survivals of Mir Jumla's invasion in 1662. They have to some extent inter-married with the people of the country, but are of comparatively pure descent, and their faith has been but little affected by Hindu superstitions. A considerable proportion of the townsfolk are, however, foreigners, who have only recently come from Bengal or Upper India. The Khalifas are supposed to be descendants of religious teachers who migrated to Assam some centuries ago. They have abandoned their original profession, which is no longer lucrative, and have taken to agriculture, but think it beneath their dignity to touch the plough or to carry a *bhar* or load affixed to two ends of a bamboo and supported on the shoulder, though they are willing to use the hoe or to carry things in bundles.

The ordinary Muhammadan villagers, who form the great mass of the adherents of that faith, are said to be fairly well acquainted with the principles of their religion. Prayers are duly said on Fridays in the more important mosques, and in some of the villages the people assemble in the open air on the occasion of the Id, after the fashion followed in the Idgarhs of the Muhammadan towns of Upper India. The fasts of Ramzan are observed in proper form, and here and there a villager is to be

found who has actually performed the pilgrimage to Mecca. They have, however, been to some extent affected by the customs of their Hindu neighbours. They believe in divination, and in the power of mantras and charms to drive away disease ; they take a bride price for their daughters, and sometimes even observe the Bihu. A few people, who are known as *jahils* or the ignorant, can hardly be described as Muhammadans at all. They take a principal part in the pujas offered to Bishahari, the goddess of snakes, and pay little attention to the teachings of their faith. Between 1891 and 1901, the Muhammadans of Kamrup decreased by 3 per cent, but this was 4 per cent less than the decrease which occurred amongst the population of the district as a whole. Conversion is said to be far from common, and it was probably immigration and superior fecundity that kept the Musalmans from decreasing as rapidly as the Hindus.

In the Hajo tahsil there are the remains of a mosque of unusual sanctity situated on the Mukamara hill. It is said to have been erected by Lutfulla Shiragi, Thanadar of Hajo, in 1657 A. D., and is known as Pao Mecca, either because a quarter of a seer of earth from that holy place was preserved in the mosque, or because a visit to this place confers one-fourth of the merit obtained from a pilgrimage to Mecca itself. Near the mosque is situated the tomb of Sultan Ghiyas-ud-din. According to one account he was the founder of the mosque but died before it was completed, while another, and less likely, story has it that he was defeated and killed by the Ahoms at Bishnath, and that his body was brought to

The mosque
at Hajo.

Hajo by his vanquished soldiery. In former days Hindus and Muhammadans alike used to make offerings at the tomb, and tie a thread to a neighbouring tree or post in order to obtain the fulfilment of their prayers. The mosque was, however, demolished by the great earthquake of 1897 and has not yet been restored.

Animism.

Most men find considerable difficulty in giving a clear and intelligible account of the faith that is in them, and the simple tribes of Bodo origin are no exception to the general rule. Broadly speaking, their religious beliefs seem to fall under the following heads. Unlike the German metaphysician, they have no uncomfortable doubts with regard to their own existence and the existence of the material world. To account for the production of these visible phenomena, they put forward various theories, which are hardly more improbable than the accounts of the creation given in most religious systems. The way in which the world came into existence is, after all, a matter of no very great importance, and the essential object of religion is to ensure a comfortable passage through life to its followers. No country or community is exempt from pain and trouble, and to the dwellers in the plains of India has been allotted a fairly liberal portion of the ills of life. When the cattle die, or small pox or cholera visits the village, or other trouble comes, it is only natural to suppose that somebody or something is the cause of these misfortunes. The untutored tribesmen then endeavour to ascertain the particular spirit from whose displeasure they are suffering, and to appease him in whatever way they can. Twenty-

one per cent of the population in 1901 were still faithful to their simple forms of tribal faith. These animistic people are found in every part of the district, but are especially numerous in the Gauhati tahsil, where they form nearly half of the population, and in Chaygaon, Boko, Rangia, Barama and Tamulpur. In Palasbari and the central portion of the plain lying north of the Brahmaputra the proportion of these people is comparatively small.

Most of the Buddhists are either Bhutia traders who visit the plains in the cold weather, or Nepalese sawyers and herdsmen. There is, however, one Bhutia and Buddhist village within British territory, the Dewangiri, to which reference has been already made in the preceding chapter. The village stands about 1,800 feet above the level of the sea on one of the outer ranges of the Bhutan Hills. The path to it lies up the Darranga river, and, as the gorge is full of boulders, it is a somewhat trying march of from three to three and a half hours' duration from Darranga camp. The village is built on a saddle from which there is a fine view to the south over the Kamrup plain, while to the north there are ranges of forest clad mountains and the gorge of the Pagladiya. Along the ridge stand twenty tall masts, each some forty feet in height. A narrow strip of cloth, printed with Buddhist prayers, is fastened along the whole length of each mast, and cracks sharply in the wind that comes roaring up the gorge and across the ridge. In the centre of this row of masts is a

**Buddhists
Dewangiri.**

curious urn-shaped cairn, nearly twenty feet in height, that has recently been erected in Buddha's honour. The houses are small uncomfortable dwellings built on piles, with floors of wood, roofs of cane and plantain leaves, and walls of split bamboo. There is only one small room, with a little verandah in front and at the rear, and pigs, goats, and poultry scratch about beneath the chang. The whole place is dirty, squalid, and untidy, and, as the bamboo walls are full of holes, the people would suffer much from cold, were it not for the masses of filthy raiment that they wear, and the big fire place in the centre of the little room. The Bhutias *jhum* the hill sides in the neighbourhood, and raise crops of rice, maize, millets, chillies, cotton, pumpkins, sweet potatoes, and arums. They weave a considerable quantity of cloth from their home-grown cotton, and occasionally use for this purpose the fibre of a nettle which springs up round their houses. They seem, on the whole, to be fairly well to do, and are lightly taxed, as they only pay Rs. 2 per house to Government, and, in addition to this, give a cloth or two to the local representative of Bhutan. Prior to 1897, there were two other British Bhutia villages in the immediate vicinity, called Bompa and Sangduli. They were wrecked in the great earthquake, and the inhabitants started forth with all their goods and chattels to make a new home for themselves. They boldly crossed the Brahmaputra Valley and settled in the hilly country round Nongpoh, more than eighty miles away, but the place proved very unhealthy and most of the people died. The remainder decided to return once

more to the Himalaya, and founded a village in the hills beyond the frontier north of Mangaldai.

The abstract in the margin gives details for other religions which were not strongly represented in the district in 1901. The Jains are the *kaiyahs* or merchants from Rajputana, most of whom were censused in Gauhati town. Here, too, were found the Brahmos, who are recruited from the ranks of the most advanced and educated natives, and the Sikhs.

The Christian population is not large, and in 1901 was represented by 64 Europeans, 36 Eurasians, and 1,379 natives. The American Baptist Mission has a centre at Gauhati, and nearly all the natives were members of this sect. Christianity seems to be spreading slowly amongst the people. In 1881 there were only 265 converts, and at the following census 876. There is a Roman Catholic priest stationed at Gauhati, but his work for the most part lies amongst the Eurasian community.

Kamrup is a purely rural area, and though the portion of the total population supported by agriculture (81 per cent) is lower than that in any other district in the Plains, it is much above the average of the Indian Empire as a whole. The bulk of the agriculturists are peasant farmers who hold direct from Government, but, owing to the existence of large estates held by the representatives of temples and holy places, the number of tenants is unusually large, and they form about one-fourth of the cultivating classes. The preponderance of

Minor religions.

Occupation.

agriculture as a means of occupation is due to two causes. The district contains only two small towns, and the urban population is but $3\frac{1}{2}$ per cent of the whole. The functional castes are, moreover, very poorly represented. Under Ahom rule the people were compelled to satisfy the various requirements of the Raja, and special crafts and industries were allotted to different groups of villagers. As soon as the pressure of necessity was withdrawn, these people abandoned the occupations which had been forced upon them and took to agriculture, which in the East is always regarded as a respectable avocation. Farm labourers, though not numerous, are not so scarce as in the upper districts of the valleys, and fishing and the priesthood afford the means of livelihood of more than 3 per cent of the total population. The number of persons who, according to the census of 1901, were dependant on charity for their support was unusually high. A large proportion of these so-called mendicants were women, many of whom were no doubt living with their relatives, and would hardly be classed as beggars in the sense in which that term is generally used.

An account of the various industries followed in the district will be found in Chapter V, and no useful purpose will be served by examining in detail the figures recorded at the census. It has now been recognized that the census tables can give but a rough and general sketch of the industrial organization of the people, and the difficulty experienced elsewhere is accentuated in Assam, where there is so little specialization of function. Most of the artizans are farmers as well as craftsmen, and there is always a

certain amount of uncertainty as to the occupation which they will return to the enumerator. In the second part of the Census Report for 1901 details will be found for the 520 different heads into which the occupations of the people were distributed. These occupations were grouped together under eight main heads, for which the following figures were recorded :—

Government 2,290 ; pasture and agriculture 479,917; personal services 6,814 ; preparation and supply of material substances 50,872 ; commerce, transport and storage 7,359 ; professions 10,950 ; unskilled labour not agricultural 6,481 ; and means of subsistence independent of occupation 24,504.

The marriage customs of Kamrup differ in some respects from those in force in Upper Assam. In Sib-sagar and Lakhimpur the custom of taking a bride price still prevails amongst the lower classes, but it is going out of fashion, and is regarded almost with abhorrence by the upper classes. In Kamrup, on the other hand, it is practically universal, and there is no caste that asks a higher price for its marriageable girls than the holy Brahman. A Brahman who has several sons will, it is said, be ruined, while one with a corresponding number of daughters is in a fair way to die rich. The community is a poor one, but in spite of this, Rs. 500 is by no means an uncommon price to ask for a Brahman girl. The contract must be made while the girl is still in her father's house, and, even if she dies before she comes to live with her husband, the price is not refunded. Not only

Marriage
customs.

has the unfortunate man to pay for a girl whose society he has never been permitted to enjoy, but he is esteemed unlucky, and on this account will probably be charged a higher price when he next attempts to provide himself with a wife.

The use of the full *hompura* rite, in which the sacred fire of mango wood is lighted and a priest employed, seems to be commoner in Kamrup than in Upper Assam.* A less imposing ritual, which is sometimes followed by the lower classes, is known as the *agchaullia*. When the bride reaches the bridegroom's house she is seated with the groom in front of a lamp and a vessel filled with rice. Their cloths are tied together, and the women of the family take up pinches of rice, wave it round their heads and throw it into the air. The bridegroom then hides a ring in a vessel which the bride has to find, and they exchange cups filled with a mixture of milk, curds, and honey. In cases where a man is unable to pay for his bride he goes to live with his prospective father-in-law and helps to cultivate his farm. This period of probation lasts for several years, but during this time the girl generally concedes to him all the privileges of a husband. The cost of a bride amongst the lower classes is generally something between Rs. 50 and Rs. 100, and there is further expenditure to be incurred on clothes, ornaments, musicians, and a feast to all the friends and relatives. In the densely populated country round Nalbari a Sudra wedding will cost as much as Rs. 200, while Rs. 1,000 is by

* A description of the *hompura* ceremony will be found on page 63 of the Assam Census Report for 1901.

no means an unusual amount for a Brahman to expend. Marriage is thus a costly undertaking, and many a man is compelled to borrow money to obtain a wife. Amongst the animistic tribes there are traces of the old *asura* form of marriage by capture, but the elopements and abductions which are comparatively common in Sibsagar are not so often met with in Kamrup.

Feasts, singing parties, and *bhaonas* or simple theatrical performances are the principal amusements of the villagers. The *bhaonas* are often held in temporary sheds constructed by the roadside, and, on a winter's morning, the traveller who is early abroad, frequently comes upon parties of revellers still lingering over the pleasures of the previous night. The *dol jatra*, or festival in honour of Krishna in February or March, when the image of the god is swung to and fro and the people pelt one another with red powder, in memory of his amorous exploits with the milk maids of Brindaban, is observed indeed, but with much less ceremony than in other parts of India. The *Janmastami* in honour of Krishna's birth in August or September, and the *Sivaraatri* in memory of Siva in March, are kept as fasts rather than feasts. The Durga puja, and the puja of Bishahari, the goddess of snakes, are also observed by certain sections of the people.

The special festivals of the Assamese are the three *Bihus*, and the *sradh* ceremonies of Sankar Deb and Madhab Deb, the founders of the Mahapurushia sect. The Kartik Bihu is celebrated on the last day of Asvin

(October 14th), and is not an occasion of very much importance. Hymns are sung in honour of God, and in place of their usual meal of hot rice and curry, the people take cold food such as curds, molasses, plantains and cold rice. The Magh Bihu is the harvest home, and begins on the last day of Pous (January 14th). For weeks beforehand tall heaps of rice straw, piled round a central pole, are a prominent feature in the rural landscape. At the dawn of day the villagers bathe, and warm their chilled bodies at these bonfires, a very necessary precaution, as at this season of the year the mornings are always cold and generally foggy. The Magh Bihu is to some extent a children's festival, and most of the jollification is confined to the smaller boys, who sing, and dance, and feast in small grass huts that have been constructed for the purpose. The Baisakh Bihu, which begins on the last day of Choet (April 14th), is in honour of the new year. The cattle are smeared with oil mixed with matikalai, turmeric, and rice, and are then taken to the nearest stream and bathed. The villagers go from house to house visiting their friends and relatives, and offer them presents of cloths and other things. Buffalo fights are organized in the rice fields, but these contests are rather tame affairs, and the animals very seldom injure one another. A game is also played with eggs in which one is banged against the other, and the egg which cracks becomes the property of the owner of the cracker. The sradh ceremony of Sankar Deb is celebrated in August—September, and that of Madhab three days before the *Janmastami*. All

work is laid aside on these two days, and the people devote their time to feasting and the singing of hymns.

In the Rangia and Nalbari tahsils there is a form of **Other games.** sport called *bhateli*, which is continued for some days after the Baisakh Bihu. Each village decorates a long bamboo with flags and streamers. The one that is adjudged the best is called the bridegroom. The others, who are termed brides, are then ranged round it in a circle, and a mock marriage ceremony is performed. On the last day of the gathering the villagers dance round the bamboos, brandishing their clubs, and the best bamboo or *para*, as it is called, is planted in a tank. At the Bihu time the villagers wrestle and jump and run against one another, a special form of race being the *hankhel*, in which it is not necessarily the fastest runner who wins but the one who can go farthest without drawing breadth. In the *fatik lai* a flower is thrown amongst the crowd and each man tries to catch it, but a more amusing variety of this game is the *narkal dalua*, in which the place of the flower is taken by a greasy cocoanut. The *biskuri khel* is a form of chevy or prisoner's base.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Crops grown.—Rice—Mustard and pulse—Fibres—Storage and threshing of grain—Agricultural implements—Sugarcane—Preparation of Molasses—Causes affecting productiveness of land—Garden crops—Yield of crops—Area of unsettled waste—General remarks—Irrigation—Live stock—Cattle disease—Grazing—Commencement of tea industry—Early days in Kamrup—Development and decline of the industry—Labour supply—Soil—Varieties of plant—System of cultivation—System of manufacture—Green tea—Forests—System of management—Reserves and timber trees—System of working—List of important reserves.—

The staple food crop of the district is rice, which, in **Crops grown.** 1902-03, covered 75 per cent of the total cropped area. Other important crops are mustard, 11 per cent, and orchard and garden crops 6 per cent. A large part of the area shown under the latter head is, however, occupied by the homestead, and it is doubtful whether as much as one half is actually under cultivation. Miscellaneous food grains, nearly all of which are different forms of pulse, occupied 4 per cent of the total cropped area, sugarcane 0.7 per cent, and tea 0.6 per cent. Wheat and gram, the food grains of Upper India, are grown in small patches by immigrants from those parts, but the total area under these two crops in 1902-03 was only 14 acres. The area under the staple crops in 1901 and subsequent years will

be found in Table VII. The general system of cultivation and the manner in which the different crops are raised is described in the following paragraphs:—

Rice
Sali dhan.

There are many kinds of rice, and no less than 147 different varieties have been reported from the district, but, for general purposes, the cereal is divided into three main groups, *ahu*, or early rice, *sali*, or late transplanted rice, and *baa*, or late broadcast rice, which is grown in flooded tracts. The percentage of the total area ordinarily occupied by these three classes is—*ahu* 32 per cent, *sali* 49 per cent, and *baa* 19 per cent.

Sali dhan is first sown in little beds or nurseries (*kothiatoli*) which are generally situated near the home-stead. Three different systems are in vogue for the sowing of this seed. Sometimes it is sown on high land which has been ploughed up till it has been reduced to a fine tilth but has not actually been puddled, but more usually it is sown on a bed of mud. When the land lies low and is exposed to flood a third course is adopted which consists of a combination of the other two, the seeds being first sown on a dry bed (*dhuliya*), transplanted into a puddle nursery, and finally moved once more to the field in which it is intended that they should reach maturity. Plants which have been treated in this way, or *joa kathiya* as they are called, are said to be unusually strong and to be less likely to suffer from too prolonged submersion. The ploughing of these seedling beds is begun towards the middle of March, and the seed is sown about a month later. It comes up a rich emerald green, and, at the beginning of summer, these patches of the

brightest herbage are a striking feature in the rural landscape. In the meanwhile the fields are being got ready for the reception of the seedlings. The husbandman starts ploughing as soon as the soil is softened by the spring rain, and repeats the process from four to six times till he has reduced the land to a rich puddle. After the second ploughing the field is harrowed, the little embankments, a few inches high, intended to retain the water, are repaired, and if the fields adjoin the road or the village site, they are often fenced in with split bamboo. When the seedlings are from four to six weeks old, they are taken from the nursery bed and carried in large bundles to the field. Here they are planted out in handfuls (*gosa*), each of which contains four or five plants. The distance at which these are planted from one another depends upon the fertility of the soil, the kind of rice, and the season at which they are planted, and varies from nine inches to as much as two feet. From the middle of July to the beginning of September is the best season for transplanting paddy, and plants that are put out later generally suffer. The work is of a most arduous description, as it involves stooping for hours in a field of liquid mud under the rays of a burning tropical sun; and it is not to the credit of the people that they generally leave it to their womenkind. Before the end of the rains, the crop is fully grown though the ears are still empty, but about the middle of October they begin to fill, and, a few weeks later, the field turns to a rich yellow. From the end of November to the beginning of January harvesting is going on. The reapers

grasp a handful of the ears and cut them off about eight inches below the head. These handfuls (*muthiya*) are tied up and left in the field for a few days to dry. When the grain is ready to be transported to the granary the *muthiya* are made into larger sheaves, six of them forming a *jhap*, and five or six *jhaps* a *dangari*. A *dangari* is then affixed to either end of a sharp pointed bamboo called *hulabari*, or *banka*, if it is a split and therefore springy bamboo, and the load, which is called a *bhar* and is carried across the shoulder, is taken to the homestead by the men.

The different kinds of *sali* dhan fall under two main divisions *lahi* and *bar*. *Lahi* ripens earlier than *bar*, and though the grain is of a finer quality, the yield is appreciably smaller. It is planted on the higher fields which dry up first at the conclusion of the rains and are thus unfit for *bar*.

Bao dhan.

Bao dhan is sown broadcast in flooded tracts about the beginning of April, and the longest stemmed varieties, such as the *pani kekoa*, will thrive in as much as ten feet of water, provided that the floods rise gradually and do not drown the crop when the shoots are young and small. *Bao* is very largely grown in the Hajo tahsil, where it covers nearly half the total area cropped with rice, and it is also an important item in Patidarang and Palasbari. It is fairly common in Rangia, Nalbari, and Chaygaon but is naturally not much grown in the northern part of the district, where the level of the land is considerably higher than it is in the neighbourhood of the Brahmaputra. It is sometimes sown in conjunction with *ahu*, the earlier crop being reaped before the *bao* is ripe.

There are three different systems for the cultivation of early rice which are known respectively as *dhuliya*, *acchra*, and *kharma*; and *dhuliya ahu* is again subdivided into two varieties, *bar* and *saru*. *Saru dhuliya* is sown on land which lies too high for *sali*, and, as its name 'dusty' implies, it is grown on fields which have not been reduced to puddle. The outturn is smaller than that obtained from *sali*, but after the earthquake, when large tracts of transplanted rice land were rendered quite unculturable, the villagers were compelled, in places like Rangia, to sow the higher lands with such rice as they would grow. *Bar dhuliya* is grown on *chapori* land, where the usual procedure is as follows. In May the jungle is pressed down and burnt and the land left till towards the end of the rains. The jungle that has sprung up in the interval is then cleared in the same way, the process being known as *gojola kata*, and ploughing begins in September. The field is ploughed three times and harrowed, and the clods are broken up by a mallet. Another ploughing and harrowing follow, the seed is sown about March and the land again ploughed and harrowed to ensure that the grain becomes thoroughly mixed with the soil. When the plants are about six inches high and catch the wind, *butah boloah*, they are harrowed again and weeded, and finally harvested about the middle of June. The crop is, however, a precarious one and is liable to be destroyed by a sudden rise of the river. The plants can live under water for as much as a week, but if after this time the floods do not retire they are permanently destroyed. The same field is seldom cropped for more than three

Ahu saru and
bar dhuliya.

years in succession. The weeds, which were unable to find a lodging under the dense growth of *ikra* (*saccharum arundinaceum*), *khagari* (*saccharum spontaneum*) and *nal* (*phragmites roxburghii*) with which the land in its natural state is covered, soon spring up when once the reeds have been burned. After the third year it is less trouble to burn fresh jungle than to clear the old fields of weeds, and by a change of site the peasant gets the further advantage of the manure of ashes for his next year's crop.

**Acchra and
kharma ahu.**

Acchra ahu is sown broadcast on wet land, but the seeds, instead of being sown dry, are steeped in water for a short time and kept in a cool place till they begin to germinate. *Kharma ahu* is transplanted, and the system of cultivation does not materially differ from that employed in the case of *sali*, except that it is both sown and harvested much earlier than winter rice. *Kharma ahu* is generally grown on irrigated land in the Kachari mauzas north of the Gohain Kamala Ali. *Ahu* is also sometimes sown on fields which are subsequently planted out with *sali*, but this system of double cropping exhausts the soil and is not generally resorted to. *Ahu* is not very largely grown south of the Brahmaputra except in the *chaporis* in Boko tahsil, but it covers a large area in the Rangia tahsil, and is a very important crop in Barama, Hajo, and Patidarang. In the Lamulpur tahsil, where most of it is transplanted, it is not far short of half the total area under rice, and in the Barpeta subdivision it occupies about two-fifths of the area under that important cereal.

Chapori land, from which a crop of *ahu* has been taken, is generally used when the floods subside either for pulse or mustard. Ploughing begins as soon as the land is dry, and towards the end of November the seed is scattered broadcast. Mustard sown on cold damp soil does not thrive, and if it is sown late it is liable to be attacked by insects, so that the timely subsidence of the floods is a factor of much importance in the cultivation of this crop. The plant ripens about the middle of February, and after it has been pulled is left to dry for a few days in the field before it is removed to the threshing floor. Mustard is extensively grown in the Hajo, Boko, Rangia, and Barama tahsils, the Bijni mauza and the Barpeta *chaporis*. Mustard and pulse.

Pulse is often grown on the alluvial flats that fringe the Brahmaputra in conjunction with summer rice and mustard, but a crop is also taken from the land on which rice seedlings, early rice, and sugarcane have been grown, as it is generally and rightly thought to improve the quality of the soil. In the *chaporis* if new land is taken up the first proceeding is to cut and burn the reeds and grass. Only two ploughings are required, and those are of the very lightest character, and, if the ground is naturally clear of jungle, the seed is sometimes simply sown on the river flats as soon as the floods subside. *Kalamah* (*lathyrus sativus*) is also scattered broadcast amongst the rice stubble, or between the *sali* plants, if the land is still soft, but this method is not generally in use. The seed is sown in September and the crop is ripe about four months later. The plants are pulled up by the roots, left for a few days in

the field to dry, and are then collected at the convenience of the cultivators. The seeds are threshed out by cattle, but as the grains do not separate readily from the pods, their efforts are supplemented by a man armed with a stout bamboo. Several different kinds of pulse are grown, the commonest of all being the variety known as *mati-mah* (*phaseolus mungo radiatus*). Other kinds are *magu-mah* (*phaseolus mungo linn*), a species which has a smaller yield and requires more careful cultivation, but commands a higher price and possesses a more delicate flavour. It is seldom grown except on the river *chaporis*.

Kala mah (*lathyrus sativus*) is a cheap pulse, but as it has a large yield it is fairly widely sown. Another variety is the lentil *masur-mah* (*lens esculenta*) which is also grown, in conjunction with mustard, on *chaporis* land from which a crop of summer rice has been already taken. The principal pulse producing tracts are to be found in the Palasbari, Rangia, and Patidarang tahsils, but very little is grown in the Barpeta subdivision.

The cultivation of jute is said to be slowly spreading up the valley, but it has not as yet made much progress in Kamrup, and in 1903-1904 the total area under this fibre was only 1,030 acres. About half of the crop was raised on the south bank, and, north of the Brahmaputra, Hajo and Rangia seem to be the only tahsils in which it is grown for sale. The seed is sown on fairly high land and the plants are cut in August and September, stripped of their leaves, tied in bundles and left to rot in pools of

water for from seven to twelve days. When they are ready a handful of stems is taken up, broken in the middle, and beaten to and fro in the water, till the inner part drops out and only the fibre remains. The bundles of fibre are then dried and are ready for use. Small patches of rhea (*Bœhmeria nivea*) are grown in the gardens of the fishing castes, where they are heavily manured. The skin is stripped off from the stem and the fibre separated from the outer covering. The thread obtained is exceptionally strong and durable, but the difficulty of decortication has hitherto prevented the growth of rhea on a commercial scale.

The custom in Kamrup differs from that prevailing in Upper Assam, and the rice is threshed as soon as it is carried home. The sheaves are untied and spread over the courtyard, and cattle are driven round and round over the heap of grain and straw till the ears have been finally separated from the stalk.* The grain is next passed through a sieve, and placed in a flat bamboo tray called *kula*. It is then jerked into the air and allowed to fall back into the tray, or held aloft and allowed to fall slowly to the ground, till gradually the chaff is carried off. After threshing the paddy is stored in huge drums, called *dhulis*, which are made of split bamboo plastered over with clay and cowdung. The rice that is required for seed is kept in loosely plaited bamboo baskets wrapped round with straw. Bundles of pulse seed are more

Storage and
threshing of
grain.

* An experiment made by Mr. Darrah, D.L.R. and A., showed that nine bullocks took 2 hours and 8 minutes to thresh out 7½ maunds of paddy.

carefully protected, and the straw is well smeared over with a mixture of cowdung and mud.

**Agricultural
implements:
The plough.**

The agricultural implements in use are of a very simple character. The plough is usually made of the jack fruit tree, or some other hard wood, and consists of three parts—the handle and body, which are usually all in one piece, the pole which joins the plough at the junction of the handle and the body, and the yoke, which is merely a piece of wood, fastened by rope at right angles to the pole, with pegs affixed to it to keep it from sliding from the necks of the bullocks. The front portion of the body is sharpened to a point, which is shod with iron, and in soft soil a piece of bamboo is sometimes substituted for the iron. This piece of iron is the only portion of the plough which the farmer has to purchase; the rest he makes for himself. The whole instrument is suited to the wretched class of animal required to draw it. It weighs, as a rule, about 20 lbs., and when cattle are used the yoke seldom stands as much as 36 inches from the ground. It is obvious that such an implement can only penetrate from three to four inches into the soil, but the wretched quality of the plough cattle prohibits the use of a more effective instrument. When buffaloes are employed the whole plough is constructed on a larger scale, and as they are yoked not singly but in pairs, the work is so much harder that two ploughmen are required to relieve one another at short intervals.

**Other imple-
ments.**

The harrow (*moi*) is generally a bamboo ladder about eight feet in length, on which a man stands as it is

drawn across the field. It is used to crush the clods turned up by the plough before mustard or summer rice is sown, and to reduce the fields required for wet rice to puddle. Its place is sometimes taken by a plain log of wood. It is prepared by the cultivator himself from the bamboos growing in his garden. Clods are broken by the mallet (*dheli mari*), which is also made at home. Hoes (*kodalis*) are used to trim the embankments which help to retain the water. The head is bought in the bazar and costs from Re. 1 to Re. 1-4, and is fitted with a shaft by the farmer himself. Sickles, with which the rice is reaped, have also to be purchased, and cost from two to four annas. In *ahu* cultivation a large wooden rake (*bindhu*), with teeth nearly one foot in length, is dragged over the crop by a bullock when the plants are about six inches high. The *nirani*, a kind of trowel with a long handle, is used for weeding *ahu* rice. The sugarcane mill is described in the paragraph dealing with the preparation of molasses. The ordinary implement used for husking grain is the *dheki*, a long beam with a pestle affixed at the end, which is supported by two posts at about two-thirds of the length from the head. The shorter end is depressed by the foot, and the pestle is thus raised into the air; the weight is then removed and the pestle falls into a hole in a piece of wood sunk level with the ground in which the grain is placed. The *dheki* is the implement ordinarily employed by the Assamese to husk their rice or pulse, but the animistic tribes generally use a large wooden mortar (*ural*) and a pestle (*muri*); all of these implements are made at home.

Sugarcane.

Sugarcane (*saccharum officinarum*) is usually grown on high land near the village site, and, as the soil is poor, it has to be well manured with cowdung; but, north of the Brahmaputra, it is sometimes planted out on land which is fit for transplanted rice and which is surrounded by a bank to keep out the water draining from the higher levels. The crop is propagated from the tops of the best canes, which are cut off at harvest time and kept in a shady place. One of these tops yields on the average about five canes, and as they contain but little juice, the cultivator does not sacrifice much of the gross product of his fields in the cause of reproduction. Four principal varieties of the plant are recognised. The *bagi* or white stands about seven feet high, and has a yellow cane of a soft juicy texture. The *tehiya* is shorter, harder, and thinner, and the canes are of a deep red or even purple colour. The *Bangala* or *bam*, a foreign variety, is larger and more juicy than the indigenous kinds. The *mahala* is a hard and thin variety which yields comparatively little juice, and where grown is planted round the edge of the field. The land is hoed up till it is reduced to a fine tilth and the tops planted in trenches between April and June. The patch is fenced with split bamboo, and there is usually a stout hedge of arhar dal (*cajanus indicus*), but constant watching is required to scare away jackals and other animals, and an empty oil tin with a clapper is generally to be seen suspended over each field. While the crop is growing it is continually hoed and weeded, and about August the leaves should be tied up round each cluster of canes, which is a troublesome proceeding. The

earth from the ridges is heaped about the roots to strengthen their hold upon the soil, and this process is continued until the relative positions of ridge and trench are reversed, and the canes stand upon ridges with the trenches in between. Harvesting goes on from January to April, and during the winter nights and in the foggy mornings the drone of the sugarcane mill is heard coming across the fields in nearly every part of the district, where the "works of men" are to be seen.

The native form of mill is still often used for the ^{Preparation of molasses} extraction of the juice, but attempts have been made to introduce the iron mill, and some two or three hundred are now hired out to cultivators, the rate usually charged being a rupee a day. The native mill consists of two wooden rollers fixed side by side in a trough hollowed out of a heavy block of wood. The tops of the two rollers pass through a hollow beam supported by uprights let through the lower block of wood into the ground, and are cut into the form of screws which fit into one another. To the larger of the two (*mota bhim* as distinguished from *maiki bhim*) is affixed a pole, which is driven round in a circle, and thus causes the rollers to revolve. The motive power is usually supplied by the villagers themselves, but buffaloes are occasionally used for the work. The mill requires rather more knowledge of carpentry for its production than the other implements of agriculture, and can only be made by the more skilful of the villagers. The cane is placed between the rollers and crushed as it is slowly forced through. Each handful is passed through the mill three or four times, till nothing but foam

appears. The juice trickles from the trough into brass or earthen vessels, and is then transferred to a small boat, scooped out of a log. When twelve or fifteen gallons have been collected boiling begins. The furnace is hollowed out of the ground and has four circular openings to receive the cauldrons, which are generally made of iron. Two of these vessels are placed about nine feet from the furnace mouth, and only serve to heat the juice before it is transferred into the other vessels to be boiled. Sometimes all of the vessels are placed immediately over the fire, but differ considerably in size. The smaller ones boil first, and their contents is then added to the larger vessels, and so help to raise their temperature. When the juice has been reduced to the proper condition it is ladled into a wooden vessel (*ghutna*) shaped like a small dug out, and is stirred for an hour or two. As the stirring continues the liquid loses its dark brown colour and assumes the consistency and hue of yellow mud. It is then stored in earthen pots and the process is complete.

Causes
affecting
productiveness of
land.

The fertility of the rice fields mainly depends upon the following five causes, the water-supply, the quality of the soil, and the liability to injury from flood, wild animals or shade. The first named factor is probably of most importance, as irrigated land in the submontane tracts yields bumper crops from light and sandy soil. The soil of the district varies from pure sand near the Brahmaputra to clay so stiff as to be utterly unfit for cultivation. The land best suited for the growth of rice is a clay loam, *atalatiya*, the most fertile variety of which is called *bherbheria*, and is particularly deep and soft. *Bherbheria*

land is found at the lowest part of the rice basins, and is enriched by the drainage from the village site. *Mohbeliya* is composed of fine sand and loam, and is well adapted for the growth of crops which have to be sown before the soil is moistened with the rain, as, even when dry, it does not bake very hard. *Kachua* is so stiff a clay that water makes but little impression on it, and it is only fit for the growth of *bae*, and not much good for even that. The animals which do most injury to the crop are pigs, elephants, and monkeys. Elephants leave disastrous traces of their presence, but luckily do not remain long in any one locality. Serious damage is sometimes done by insects which are called *keonkata*, *tupalia*, *gandhi* (*leptorisa acuta*) and *chara* (*hispa acuesceus*). The *gandhi* is a small bug which injures the rice plant by feeding on the stems, and sucking all the sap from the young grains. It is most prevalent in July and August, and is particularly on evidence during a spell of hot dry weather. High wind and rain drive it back into the jungle, and good results are obtained by lighting fires of vegetable refuse to windward. The best remedy of all is to collect the insects by smearing a winnowing fan with some glutinous substance and pushing it over the ears of grain, when many of the bugs will be found adhering to the fan. This remedy should be tried in the morning or late afternoon, as the insects do not feed in the heat of the day. The *chara* is a tiny beetle, which eats away the outer surface of the leaves and stalks, and thus affects the outturn of the crops. It attacks the young plants in the nursery and can most

easily be destroyed there by spraying.* Smoking the fields also produces good results, but must be continued for some days or the beetles will return. Birds such as the *kaim* and *choka* also do some damage to the rice. Rain is wanted when *sali* is sown and is transplanted, but is not needed for the sowing of *ahu* and *bao*. During every stage of its growth the plant is benefited by moderate showers, but rain is absolutely essential at the time when the ears are first appearing. Hail-storms in December sometimes lay the crop and add materially to the cost of reaping, but fortunately are very local in their action.

Garden
crops. The
plantain.

One of the most valuable of garden crops is the plantain (*musa sapientum*). As many as ten main varieties of this tree are recognised, but the most important are those known as *athia*, *monohar*, *cheni champa* and *malbhog*. The first two groups are again subdivided into a considerable number of different species. The commonest form of *athia* is called *bhim*, a large tree which is found growing in the garden of nearly every house. The fruit is considered cool and wholesome, and is very generally used as food for infants. The *monohar* is a somewhat smaller tree; the pulp of the fruit is white and slightly acid in taste, and is largely used in combination with soft rice and milk at village feasts. The *malbhog* and *cheni champa* are small trees, whose fruit is much appreciated by Europeans. The *athia* plantain is generally grown near the homestead where it can obtain a plentiful

* The best solution is 1 lb. Paris Green, 1 lb. freshly slaked lime or flour and 150 gallons water. The solution should be kept constantly stirred and should be sprayed on with a fine sprayer.

supply of manure. The finer varieties are planted at a little distance to protect them from the earthworms, whose attacks they are hardly strong enough to resist. Sandy soil and heavy clay check the growth of the plant, and anything in the shape of waterlogging is most injurious. The trees are planted in holes about a foot wide and eighteen inches deep and are manured with cowdung, ashes, and sweepings. Young saplings take from eighteen months to two years to flower, and the flowers take from three to six months to turn into fruit. The plantain tree plays many parts in addition to that of fruit purveyor. The flower is much esteemed as a vegetable, the leaves serve as plates, and the trunks are used for decorative purposes on occasions of ceremony, and as food for elephants. An alkaline solution distilled from the sheaths and the corm of the *athia* is often used as a spice with curry. These portions of the tree are sliced, dried, and reduced to ashes. The ashes are placed in an earthen pot in which there are several holes lightly plugged with straw. Water is then poured over them, which dissolves the alkali and trickles through the holes into the receiver below. The resulting product, which is known as *kharpani*, is used not only as a seasoning but as a hair wash, and as a mordant with certain dyes.*

The betel nut (*areca catechu*) is grown almost as universally as the plantain, and, with the bamboo, forms

Other garden crops.

* The manufacture of *kharpani* is referred to by the historian of Mir Jumla's invasion. "Some of the natives dry the *kelak* plant in the sun, burn it, and collect the ashes in a white sheet which they fix on four poles. They then gradually pour water on the ashes and catch whatever percolates in a vessel below the sheet. The liquid is salt-petre like and very bitter; but they use it as salt."—J. A. S. B., Vol. LXI, Pt. 1, No. 1, 1872, page 77.

the great trinity of trees in which the houses of the Asamese are usually embedded. The plantation is hoed up and kept clear of weeds, and the trees are most liberally manured with cowdung. The pan vine (*piper betle*) is frequently trained up their stems, and the leaf and nut, which are generally eaten in conjunction, are thus grown side by side. Tobacco is a plant which is to be seen growing in the majority of gardens. The seedlings are raised in carefully manured beds in August and September. At the beginning of November, they are transplanted into ground which has been reduced to a fine tilth, watered for a few days, and protected from the sun by little sections of the plantain trunk. The bed is lightly hoed up two or three times, and not more than ten or twelve leaves are allowed to grow on each plant, the remainder being picked off as they appear. The leaves are first gathered in February and March, and there is a second but much inferior crop about two months later. If required for chewing they are either dried under a shed, or else pressed into a hollow bamboo (*chunya*) and allowed to ferment. When the tobacco is destined for the pipe, though this is not the use to which it is generally put, the leaves are piled in heaps till they ferment, cut up and mixed with molasses, and then are ready for the hookah. The commonest forms of vegetable grown are spinach *pui* (*basella alba*), *lahi*, a species of *brassica*, different kinds of arums (*kachu*), different kinds of yams (*dioscorea*) and gourds, the country bean *urahi* (*dolichos lablab*), the common mallow *lofa* (*malva verticillata*), the raddish *mula* (*raphanus sativus*), the sorrel *chuka*

sag (*rumex vesicarius*), the brinjal (*solanum melongena*), *pulang*, a kind of beet-root, and *dhoniya*, whose seeds and leaves are used for curry. Potatoes are also grown extensively on the churs of the Brahmaputra.

The outturn of different crops varies according to the character of the season, and also

Yield of crops.

to a great extent according to the character and level of the soil on which they have been grown.

The statement in the margin shows the normal yield per acre laid down by the Agricultural Department after a long series of experiments. These figures only represent a general mean, and even in a normal year there are many fields whose outturn varies largely from the average. The yield of rice, it may be premised, is expressed in terms of husked grain. The prices obtained by the raiyats vary very materially in the different parts of the district and in different seasons. Unhusked paddy sometimes sells at the rate of 60 seers to the rupee, clean white rice sometimes fetches Rs. 2-8 the maund. Mustard generally brings the cultivator from Rs. 2-8 to Rs. 3 per maund.

The figures in the margin show the total area of the district, as reported by the Assistant Surveyor-General, Calcutta,

	Square Miles.
Area of the district ...	3,858
Settled area ...	1,012
Area of reserved forests ...	149
Area of waste land ...	2,697

Area of unsettled waste.

the settled area, and the area of reserved forests in 1902-03, and the area of waste land at the disposal of Government in that year. No less than 70 per cent of the

total area of the district falls in the latter category, but it must not be supposed that the whole of this area is fit for cultivation or human habitation. The figures include the area of roads, of tracts that are permanently under water, and of hills. It also includes the area of extensive tracts which are submerged during the rainy season, and are hardly fit for permanent habitation, and of land which is too high or barren to be fit for the growth of food crops. It is useless to attempt to form any estimate of the proportion of the unsettled area in which cultivation could be carried on with profit, and it is hardly necessary to do so, as it is obvious that the district could support a much larger population than it now possesses. The most extensive blocks of waste land in the sadar subdivision are to be found in the Gauhati and Boko tahsils south of the Brahmaputra, which include large areas of unculturable swamps and hills, and in the Tamulpur tahsil near the Himalayas. There is, however, a marked difference in the proportion between cropped and waste land in different parts of the subdivision. In the Gauhati tahsil there are nearly five acres of unsettled waste for every acre cropped, in the Boko tahsil there are over seven, and in Tamulpur there are nearly nine. In Nalbari, on the other hand, it is quite the other way, and there are nearly three acres under crop for every acre waste, in Patidarang there are nearly two, and in Barama, Rangia, and Palasbari the proportions are far from being equal. In the Barpeta subdivision as a whole the proportion of Government waste to cropped land is more than two to one, and in the Paka mauza it is

no less than sixteen to one. A large proportion of this waste land is, however, at present quite unfit for cultivation. Bagribari, Soriha, Uttar Bajali, Pub Bajali, and Manikpur are the mauzas in which there is relatively the smallest quantity of unsettled waste. Table XV A shows the area of unsettled waste in each tahsil or mauza.

Manure is seldom used except for sugarcane, garden crops, and very occasionally for mustard. Agriculture sustained a serious blow after the earthquake of 1897. Much of the best rice land was damaged by deposits of sand, and still more by the silting up of the drainage channels. The area under mustard was materially reduced, and as yet no new crops have been introduced to take its place. The cultivation of jute is extending, but very slowly. Wheat has been tried as an experiment in the Hajo tahsil and the Paka mauza, but it is too early yet to say whether it will be adopted on a commercial scale.

General
remarks.

In the submontane tracts the fields are irrigated by water drawn from the hill streams, and this enables the villagers to raise bumper crops from comparatively poor and sandy soil. The following description of these irrigation works is taken from a note by Mr. Barnes, the Settlement Officer :—

“ The *modus operandi* in their construction is to dam a stream several miles above the point at which the water-supply is required. The dam is called *bundh* ; at the dam a side channel (*muguri*) is left for the passage of boats: from above the dam a channel (*dong*) is constructed to lead the water to the particular area which it is proposed to irrigate. Where water is required for any particular field, a cut (*bolom*) of the requisite depth is made in

the side of the *dong*, and, finally, if there is an excess of water, a channel (*ulta dong*) is made to convey the surplus into some adjacent river. Some of these channels are over seven miles in length, and they are frequently subdivided. In one case one channel is carried across another by a wooden trough. They vary in breadth and depth, but are ordinarily about six feet broad and four feet deep. The total length of irrigation channels in the Bajali tahsil is approximately 50 miles. They are constructed by voluntary labour, any absentee paying Re. 1 to the village common fund. Frequently several villages combine to construct a channel."

The existence of these irrigation works renders the position of the cultivator unusually secure, and this fact is now for the first time being taken into account in the assessment of the district.

Damage
done by
flood.

Prior to 1897, most of the drainage of the district was collected in the Chaulkhoa river, and was carried into the Manas, and so into the Brahmaputra. For the greater part of its course the Chaulkhoa flows westward parallel to that great river, and it was connected with it by several channels, which carried off the flood water, and allowed the land to dry in time for the sowing of the mustard crop. After the earthquake, the Chaulkhoa, the Saru Manas, and the Kaldiya, two rivers which fall into the Chaulkhoa near Barpeta, were all silted up, and the emergency channels to the Brahmaputra were choked with sand, with the result that the country from the neighbourhood of Hajo to Barpeta became water logged.

Matters began gradually to right themselves as the rivers began to scour away their beds, but progress was naturally slow. The raiyats were, however, induced to combine to re-excavate four channels from the Chaulkhoa to the Brahmaputra, called the Kukuajan, the Phuta,

Baralia, the Moamarijan, and the Borsolijan, while the Public Works Department cleared the Chaulkhoa itself, as far as Bijlighat, and a portion of the Kaldiya. Further east the Dharmapur mauza was flooded by the water of the Pagla Diya river, which changed its course and came down the Bura Diya. The Public Works Department accordingly turned the river still further east into a channel of the Noa Nadi, which had formed after the earthquake, and conducted it by this route into a *bil* near Bijlighat, from which it escapes into the Chaulkhoa, and so into the Brahmaputra.

The portions of the sadr subdivision which at present suffer most severely from flood are the Dharmapur mauza, the northern portions of Uttar and Dakhin Barkhetri and Ramdia mauzas, and the northern and western portion of Hajo mauza. The whole of this area is one vast sheet of water in the rains, and many of the villages are built on what are virtually small islands. In the Barpeta subdivision the Paka mauza, and a portion of Sarukhetri, Bhawanipur, Dakhin Bajali, Manikpur, and Hastinapur are all exposed to serious floods.

The buffaloes of the district belong to two distinct **Live stock** breeds, the Assamese and the Bengali. The Assamese **Buffaloes.** are the larger of the two, and are fine upstanding animals with widely spreading horns. During the cold weather they are generally grazed in jungly tracts, and a wild bull often attaches himself to the herd, and becomes the sire of many of the calves. This continual infusion of a good strain of blood does much to maintain the

excellence of the breed. The Bengali buffalo is a smaller and less imposing animal, and does not command so high a price, a bull costing from Rs. 12 to Rs. 25 and a cow from Rs. 20 to Rs. 60. The Assamese or *kacor* animals are more expensive. The *dunosla* or cross breeds from the two main stocks occupy an intermediate position both as regards value and price.

Buffaloes rarely get anything but grass and a little salt to eat. In the cultivated portions of the district they are usually placed in charge of a small half naked boy, whose legs can hardly stretch across the massive back of the animal he bestrides, and who guides it with a nose rope. In the *chaporis* the herd is driven out to graze in the jungle, and follows the lead of the older cows, whose whereabouts is indicated by the metal or wooden bells that are dangling from their necks. They are often trusted to return in the evening of their own accord, and a long line of animals is sometimes to be seen swimming across a channel of the Brahmaputra which separates them from the huts in which the graziers live. Often too, as the sun is setting, a herdsman is to be seen climbing a simul tree, which raises its head above the surrounding wastes of grass, to call his buffaloes home. At night each animal is fastened by a nose rope to a post, and sleeps on the bare ground. The professional graziers are generally Nepalese, and they keep their buffaloes in the *bils* and marshy tracts that fringe the Brahmaputra, or on the high grassy plains at the foot of the Himalaya. A cow is said to remain in milk for about ten months, and yields at the beginning from two to four seers every

day. The amount gradually decreases till a month or so before the next calf comes, when it ceases altogether. The milk is very white and rich in fatty materials, and consequently yields a large proportion of *ghi*. The cows are said to begin breeding when three years old, and to continue doing so for fifteen years, during which time they give birth on the average to about ten calves. The normal life of a buffalo is from 25 to 30 years. Age is judged by the incisor teeth.

Half starved, under sized, ill bred, and not unfrequently diseased, the Assamese cattle are but sorry creatures. The bullocks find it a difficult task to drag even the light native plough, and the cows yield but a minimum of milk. The causes of this degeneracy are not entirely clear, but are probably to be found in a total indifference to laws of breeding, in absolute neglect, and partly, perhaps, in the want of suitable fodder in the rains. No bulls are set aside to be the sires of the herd, and the cows are generally covered by a young and immature animal, who secures the object of his desires by his superior lightness and agility. The sire is often closely related to the dam, and she in her turn has had her strength exhausted by being covered when herself little more than a calf, and by subsequent breeding without the smallest intermission. The cattle are never groomed, and when an epidemic breaks out no attempt is made to isolate the sick. "Everything," as Mr. Darrah* says, "is left to nature, from the moment when the most active, and therefore probably the youngest,

Cattle.

*The information given in these paragraphs is taken from a note compiled by Mr. Darrah, Director of Land Records and Agriculture, in 1887, and from reports received from the Tahsildars and Mauzadars in Kamrup.

bull of the herd has succeeded in covering a cow, until the progeny, after years of work and semi-starvation, dies neglected in some unfrequented jungle." If nasty they have at any rate the merit of being cheap, and cows generally cost from Rs. 8 to Rs. 15, bullocks, which are usually castrated when three years old, from Rs. 10 to Rs. 25. The cattle brought down by the Bhutias in the cold weather are, however, a very different class of animal, and are almost as large as the well known Alderney breed. Unfortunately their numbers are not sufficient to produce any perceptible effect upon the cattle of the district as a whole, and the bullocks do not stand the heat very well.

Goats and
sheep and
ponies.

The goats are almost as degenerate as the cattle. They yield but little milk, the whole of which is taken by the kids, and are only kept for food or sacrifice. At night they are usually shut up in a small outhouse with a raised floor, which is approached by a slanting board or sloping bamboo platform as a protection against jackals.

Sheep are brought down by the Bhutias in the winter, but, if the figures of the cattle census are correct, the total number in the district is extremely small.

The Bhutia ponies are seldom more than twelve hands high and are shaggy little animals with no manners but considerable staying powers. Thanks to the existence of this breed the country ponies of Kamrup are not quite as miserable creatures as the ones that are usually to be seen in Upper Assam.

The following figures show the number of animals in the district as ascertained at a census taken in 1899 :—
Bulls and bullocks 196,000 ; cows 148,000 ; bull buffaloes 3,000 ; cow buffaloes 8,000 ; young stock 182,000 ; sheep 82 ; goats 63,000.

The most common forms of cattle disease prevalent in the district are foot and mouth disease, rinderpest (*guti*), a disease called *kachua*, the principal symptoms of which are flatulence and diarrhæa, (*marki*), cholera, *matikhua*, the first symptom of which is, as the name implies, the eating of earth followed by dysentery, and *sukuna*, when the animal refuses to eat and dies after ten days or a fortnight. Cattle disease.

During the winter cattle are grazed on the stubble left in the fields, on high land that is lying waste, and in swamps and marshes. In the rains they have to be pastured on high land between the rice fields, and in the more densely settled portions of the district there is a dearth of grazing ground. The villagers here either feed their animals on rice straw or on grass brought from a distance, and the poor feeding in the rains has possibly something to do with the miserable condition of the cattle. Grazing.

The tea industry, which bulks so largely in the commercial development of Tezpur and Lakhimpur, is of comparatively small importance in Kamrup. The indigenous tea of Assam was first brought to the notice of Government in 1826 by Mr. C. A. Bruce, a gentleman who had been engaged in trade in the Commencement of tea industry.

province while it was still under native rule, and who had been sent up the Brahmaputra in command of a division of gunboats in 1824*. In 1834, a committee was appointed by Government to enquire into the possibility of cultivating tea on a commercial scale, who deputed three of their members, Drs. Wallich, McClelland, and Griffiths, to visit Upper Assam. Nurseries were established, a small establishment was entertained under the general management of Mr. Bruce to search the jungles for plots of indigenous tea and cultivate them when discovered, and plants and seed were brought from China. Tea makers and trained Chinese were imported in 1837, and in the following year some of the manufactured product was sent to England and met with a most favourable reception. Assam tea was regarded as a curiosity, and the first eight chests which were put up to auction fetched sums which at the present day seem little short of fabulous, the prices paid ranging from 16s. to £ 1-14-0 a pound. These were, however, only fancy prices, and a short time afterwards a merchant offered to purchase tea in considerable quantities at prices ranging from 1-10½ d. to 2s. a lb.

**Early days
in Kamrup.**

The pioneer of tea in Kamrup was Mr. W. Robinson, of the Education Department, who has been sometimes called the historian of Assam. In 1853, he took up a small grant

*Information with regard to the early history of the tea industry has been derived from :—

- (1) Papers regarding the tea industry in Bengal, Calcutta, 1873.
- (2) Selections from the records of the Government of Bengal No. XXXVII papers relating to tea cultivation in Assam, Calcutta, 1861.
- (3) Report of the commissioners appointed to enquire into the state and prospect of tea cultivation in Assam, Cachar and Sylhet, Calcutta, 1868.

of 155 acres at Phatasil in the Ramsa pargana, which five years later was said to yield some 12 maunds of tea. There was a general impression that the plant would not do as well in Kamrup as in Upper Assam, an impression which has unfortunately been justified, and Colonel Jenkins' prognostications, that though the shrub might not grow so luxuriantly it would yield sufficient produce to make the cultivation reasonably remunerative, have hardly been fulfilled. The first gardens were opened out on the low hills in the neighbourhood of Gauhati. The situation is extremely picturesque, but the yield is small, as when the jungle is cleared the soil is washed away from the steep slopes and the roots of the bushes are exposed.

In 1859 there were ten grants in Kamrup, which covered an area of 12,207 acres, but over 9,000 acres out of this total were included in a single grant held by Mr. Becher at Barduar. It is, moreover, doubtful whether this figure was correct, as in 1872 the Barduar grant was said to contain only 4,737 acres. The area under cultivation was reported to be 297 acres and the yield some 6,000 lbs. of manufactured tea. In the early sixties the industry passed through serious vicissitudes due to over speculation, but it was never at any time of sufficient importance in Kamrup for its success or failure to leave much impression upon the general condition of the district.

In 1872, there were 15 plantations with 1,500 acres of mature plant, which yielded 278,000 lbs. of manufactured

tea. Ten years later there were no less than 101 so called gardens, but most of them were but tiny patches of land, as the total area under mature plant was only 5,286 acres and the yield 951,000 lbs. of tea. The maximum area under mature plant according to the returns was reached in 1889, when 6,057 acres, which were distributed over 89 gardens, yielded 1,164,000 lbs. of tea. From that time onward the industry has steadily declined. The fall in prices rendered it impossible for small gardens, which suffered from special disadvantages of soil, rainfall, and inferiority of plant, to compete with the large estates which had been opened out on more fertile land in other parts of India. In 1900, there were only 22 gardens in the district, with 3,717 acres of mature plant, which yielded 768,000 lbs. of tea. Details for later years will be found in Table VII and for each of the gardens in Appendix A.

**Labour
supply.**

The industry is largely worked by local labour, but it has to be supplemented by importation from other parts of India: 2,674 coolies with their dependants were imported in the ten years ending with 1890, and 3,704 in the next decade. In spite of this nearly half of the population censused on the plantations in 1901 (5,828) had been born in the Kamrup district.

Soil.

A friable red loam is the soil that proves most suitable for tea. The plant requires a heavy rainfall, but anything in the shape of waterlogging is most prejudicial to its growth, and gardens should only be planted out on land which can be well drained. Land which in its natural state is covered with tree forest is usually con-

sidered the most suitable, as the absence of timber generally shows either that the place is liable to flood, or that the soil is sandy, or that the rainfall is deficient.

Four distinct varieties of wild tea are recognised, Varieties of plant.
Assam indigenous, which has a leaf from 6 to $7\frac{1}{2}$ inches in length by $2\frac{3}{8}$ to $2\frac{1}{4}$ inches in width, Manipur or Burma indigenous with a larger, darker, and coarser leaf than the preceding variety, Lushai or Cachar indigenous, whose mature leaf is from 12 to 14 inches long and from 6 to $7\frac{1}{2}$ inches wide, and the Naga indigenous, which has a long and narrow leaf. In addition to these four varieties there is the China plant, and different kinds of hybrids. The China tea is a squat and bushy shrub with small leaves, which gives a lower yield per acre than the other kinds. It is many years since China seed was planted in new clearances, and considerable areas covered by this plant have been abandoned. In its natural state the indigenous plant attains to the dimensions of a tree, varying from 20 to 50 feet in height, though its girth seldom exceeds two feet. It has a vigorous growth and yields a large outturn of fine flavoured tea, but is delicate when young. Of the hybrid variety there are many qualities ranging from nearly pure indigenous to nearly pure China. A plant with a very small admixture of China is usually preferred, as this imparts the hardiness, the want of which is the one defect in the indigenous variety.

The seed is planted in nursery beds in December and January, and kept under shade till the young plants are System of cultivation.

three or four inches above the ground. Transplanting goes on between April and July, whenever there is rain, the plants being usually placed from four to five feet apart. During the first two years of their life little more is required than to keep the plantation clear of weeds. By this time the plants are from two to four feet high, and at the end of the rains they are pruned down to fifteen inches or a foot to encourage lateral growth. In the third year the plant can be lightly plucked over, but the yield of leaf is small. Pruning is continued every year, only about two inches are left of the wood formed since the previous pruning and any unhealthy or stunted branches are removed. As an extreme remedy old plants, in which there is a large proportion of gnarled and twisted wood, are sawn off level with the ground, and fresh shoots are allowed to spring from the root itself. During the rains the garden is hoed over several times, in order to render the soil permeable both to rain water and the roots of the bush. At the end of the rains the ground is hoed up to the depth of eight or nine inches. The object of this is to protect the land from drought as the hoed up soil prevents the evaporation of water from the lower strata. It also adds to the fertility of the land by exposing it to air, light, and changes of temperature. Manure has hitherto been little used. Oil cake and cowdung are occasionally spread about the plants, and exhausted land is sometimes top-dressed with rich soil from a neighbouring marsh. The cost of these operations is considerable, and they are not invariably successful from the pecuniary point of view.

Plucking begins in April and is continued till the beginning of December. The bud and the two top leaves are taken from each shoot, but fresh leaves soon appear, and in about five weeks' time the shoot is ready to be plucked again. This throwing out of new leaves is termed a flush, and there are usually five or six full flushes in a season, though each bush is picked over every ten days or so, as the twigs develop at different times. The plucking is usually done by women and children, while the men are engaged in hoeing up the ground around the plants. The plant is liable to be attacked by a large number of pests, the best known being the tea mosquito or blight, the green fly, and the red spider. A full account of these pests will be found in "The Pests and the Blights of the Tea Plant," by Watt and Mann, Calcutta, 1903.

When the leaf has been taken to the factory, it is spread out in thin layers on trays and allowed to wither. In fine weather the process takes about 20 hours, but if it is cold and wet from 30 to 40 hours may elapse before the leaf is ready. When the leaf has been properly withered it is placed in the rolling machines. The object of rolling is to break up the cellular matter and liberate the juices, and to give a twist to the leaf. Rolling takes about 40 minutes, and after this the leaf is placed in a cool room for about $3\frac{1}{2}$ hours to ferment. It is then placed on trays in the firing machines, through which hot air is driven, until the last trace of moisture has been expelled, and the tea is crisp to the touch. The leaf is then passed through sieves of varying degrees

System of
manufac-
ture.

of fineness, and the tea sorted into different grades. The best and most expensive quality is called broken orange pekoe and is made from the bud or tip, which contains all the good qualities of tea in a more concentrated form than any of the other leaves, is stronger, and has a more delicate flavour. The other grades, which are differentiated by the size of the mesh through which they pass, are orange pekoe, broken pekoe, souchong, and fannings. After the tea has been sorted it is fired once more to remove any moisture it may have absorbed from the surrounding atmosphere, and is packed in lead lined boxes while it is still warm. Tea loses largely in weight during the process of manufacture and about four pounds of green leaf are required to produce one pound of the finished article.

Green tea.

Of recent years an attempt has been made to introduce the manufacture of green tea in order to meet the demands of the American market. In 1902, the Indian Tea Association offered a bounty of $1\frac{1}{2}$ annas on every pound of green tea manufactured. The following year this bounty was reduced by half and over 60,000 pounds of green tea were exported from Kamrup. The principal difference between the manufacture of green and black tea is that the former article is not fermented. As soon as the leaf comes in it is steamed in a drum for about half a minute, a process which turns it a bright green colour, and effectually stops all fermentation. Excess moisture is then removed by a hydro-extractor or centrifugal machine, and it is then rolled, fired, and sorted into the following different

grades—pin head, gunpowder, young hyson, hyson No. I, hyson No. II, twanky and dust. The infused leaf should be of a bright green colour, and the liquor of a very pale yellow shade. Most of this tea is sent to North America, but a small quantity is sold in the mid-lands counties of England.

The forests of Kamrup fall into two main classes, the **Forests.** reserved forests, which in 1902-03 covered an area of 149 square miles, and the unclassified state forests, which in the same year occupied the enormous area of 2,306 square miles. Unclassified state forest is, however, simply Government waste land, and does not necessarily possess any of the characteristics which are usually associated with the expression forest. It may be a sandy *chur*, or a huge expanse of low-lying land covered with high grass and reeds and almost totally destitute of trees. It may be a small piece of arable land which has been resigned by its former holder and has not yet been settled with any other person, or it may be, what its name would naturally suggest, actual tree forest. It is impossible to give even the roughest estimate of the proportion of unclassified state forest which is under timber, but, where the total area is so enormous, it is obvious that, in a country with a heavy rainfall like Assam, the area covered with trees must be considerable.

The management of the Government forests is general- **System of**
ly entrusted to a Deputy or Assistant Conservator, but the **manage-**
unclassified state forests are under the immediate control **ment.**
of the local revenue officials. Settlement holders are

allowed to remove all minor forest produce, including unreserved trees, which is needed for their own purposes free of royalty.

**Reserves
and timber
trees.**

There are altogether 29 reserved forests in Kamrup, but there are only three, the Pantan, Rani, and Barduar, which cover an area of more than ten square miles. The other forests are for the most part isolated hills or other small patches of land covered with sal, and, with the exception of the reserves at Hajo and Darranga, they are all situated south of the Brahmaputra near the outskirts of the Assam range. No detailed description of growing stock has yet been made, but it is thought that about two-fifths of the total area is under sal (*shorea robusta*), and that the remainder consists of equal proportions of green forest, bamboos, and grass jungle. The most valuable timber tree in the district, with the exception of teak, of which there is a small artificial plantation at Kulsi, is sal. Other good trees are sam (*artocarpus chaplasha*), titasapa (*michelia champaca*), ajhar (*lagerstræmia flos reginæ*), amari (*amoora spectabilis*), gunserai (*cinnamomum glanduliferum*), khakan (*duabanga soneratioides*), makria (*schima molois*), paroli (*sterenspermum chelonoides*), koroi (*albizzia procera*) and labu (*ficusisoraphii*).

**System of
working.**

Trees which are converted into dugout canoes are generally hollowed out in the forest and carried to the nearest river or dragged to the nearest road and carted. They are then taken to the sale depôts at Loharghat, Kulsi, Boko, and Singra, where they are purchased by local traders, who re-sell them at Goalpara,

or to Bengalis, who take them down to Mymensingh and Dacca. Sleepers and planks are generally sawn up in the forest by hand, but there is one small mill at Barduar. Logs known as *dhums*, which are generally sawn up into lengths of from six to twelve feet, are exported to Bengal for boat building. They are floated down the Kulsi, Batha, Boko and other rivers, but, in the case of sal and other heavy timber, the logs have to be attached to boats, as their specific gravity is greater than that of water.

The principal centres of trade are Kukurmara and Nagarbari for logs, Loharghat, Kulsi, Boko, and Singra for boats, Palasbari for sleepers, and Gauhati for building materials. The deciduous forest is protected, and generally successfully protected, from fire during the dry season. Figures showing the percentage successfully protected and the cost will be found in Table IX, which also contains figures showing the outturn from reserved and unclassified forests and the receipts and expenditure of the Department. There is one artificial plantation maintained by the Department on the Kulsi, where there are 163 acres under rubber (*ficus elastica*) and 300 acres under teak (*tectona grandis*).

List of Forest reserves ten square miles and more in area.

Name of reserve.	Situation and character of soil.	Area in square miles.	Date of constitution.	Route for extraction of produce and market centres.
Pantan ...	Situated on the west bank of the Kulsi river opposite to Barduar reserve in the Bajai mauza of the Chaygaon tahsil. For the most part steep and rugged hills of crystalline rock with a covering of sandy loam. In the valleys a rich loam with vegetable mould on the surface.	34	1878	The timber is extracted by the Kulsi river and taken to Kulsi, Kukurmara, and Palasbari sale depots.
Barduar ...	The reserve is situated on either side of the Kulsi. Throughout the level portion of the reserve the soil is a sandy loam of great depth, and where it is not swampy is well adapted for the growth of sal.	25	Do.	The timber is brought down the Batha and Kulsi rivers to Kukurmara and Palasbari.
Rani ...	The reserve is divided into two blocks situated on the northern face of the Khasi Hills in Rani mauza. Both blocks consist entirely of hills of granitic rock with sandy loam as surface soil. The hills are not precipitous nor are there any surface boulders excepting in some places. The soil is mostly deep and capable of producing a very superior growth of sal.	17	1882	Lines of export.—The Jaglunadi for the southern and western portions of block I, for the rest the Kalmani, Khana, and Bharadu rivers and the Dipar <i>bil</i> . The timber is taken to Kukurmara and Palasbari.

CHAPTER V. INDUSTRIES.

Arts and industries—Weaving—Silk—Pottery—Metal utensils—
Mat-making—Lac—Fishing.

The arts and industries of Kamrup are not of very much importance as the Assamese have little aptitude for handicrafts. In the days of native rule a certain proportion of the people were compelled to satisfy the varied wants of the Raja and his nobles, but, when the pressure of necessity was removed, they sank back into the great mass of agriculturists from which they were being gradually evolved. Many of the animistic tribes earn the ready cash required to pay their revenue by rearing silk-worms, and much of the clothing that the people wear is woven by the women of the family. A certain quantity of pottery and of brass and bell-metal utensils is turned out ; mats are made and lac is grown for export. Blacksmiths forge daos, ploughshares, and knives, and oil is expressed by the bullock mills of Upper India, but, generally speaking, the industries of Kamrup are in a very undeveloped state. Recently a step has been taken in the right direction, and an attempt has been made to work up the raw material of the district locally instead of exporting it in the crude state to Calcutta. Two steam mills have been opened in Gauhati. The larger of the two deals solely with mustard oil, and has a daily outturn of 1,200 gallons. In the other flour is ground

Arts and Industries.

and cotton ginned by steam, and a certain quantity of mustard oil expressed.

Weaving.

The weaving of cotton cloths is carried on by rich and poor alike. Though cotton is grown in the hills of the Province, and though many different dyes are to be found growing in its forests, the material employed is generally imported yarn, which is supplied in the requisite shades by the village shopkeeper. The framework of the loom consists of four stout posts which are driven into the ground so as to make a rectangle about 5 ft. 10 in. by 2 ft. 6 in. and are joined together at the top by cross beams. The implements required for the conversion of raw cotton into cloth and the system of manufacture followed are described in the minutest detail in a "Monograph on the Cotton Fabrics of Assam" published by the Superintendent of Government Printing at Calcutta in 1897. Descriptions of mechanical processes of this nature are, however, at their best unsatisfactory, and are hardly intelligible without a series of diagrams. The total cost of the whole apparatus is about ten rupees, and, as weaving only occupies the leisure moments of the women, the use of home-made clothing helps to save the pocket of the villager. Very little cotton cloth is prepared for sale, and there can be little doubt that weaving as an industry is commercially a failure, the price obtained for the finished article being out of all proportion to the time expended on its production. The principal articles made are *churias* or waistcloths, large sheets or shawls worn as wraps called *chadar* or *bor kapor*, and smaller shawls called *chelengs*. A kind of shawl called

paridiu kapor is very finely made, and is enriched with a beautifully embroidered border. It costs sometimes as much as Rs. 200. Of recent years the use of imported clothing has been coming into favour, an innovation which has little to recommend it, as the time formerly spent at the loom is not as a rule assigned to any other useful occupation.

Only two kinds of silk are produced in Kamrup, *eri* and *silk muga*, as the *pat* worm (*bombyx textor*) is no longer reared. The *muga* worm (*antheroea assama*) is generally fed on the *sum* tree (*machilus odoratissima*). Five different broods are distinguished by vernacular names, but in Kamrup the only broods commonly reared are the *katia* in October—November, and the *jethua* in the spring. The complete cycle of the insect lasts from 54 to 81 days, the bulk of which is occupied by the life of the worm. When the moths hatch out the females are at once attached to straws which are hung up inside the house, and are visited by the males who are allowed to remain at liberty. Each female produces about 250 eggs, which are kept in a dark place, and when the worms appear they are at once transferred to the *sum* tree. A band of straw or plantain leaves is fastened round the trunk to prevent them from descending, and during the night they take shelter under the leaves. Constant vigilance is, however, required to keep off crows, kites, owls, large bats, and other pests which prey upon the worm, and hail and heavy rain not unfrequently do damage. When fully grown the worm is about 5 inches long and nearly as thick as the forefinger. In colour it is green with a brown and yellow

stripe extending down each side, while red moles with bright gold bases are dotted about the surface of the body. When the worms are ready to spin they descend the tree and are then removed to the house. *Muga* silk is chiefly manufactured for home use, and very little is produced for sale. The principal centres of cultivation are Dimaria, Beltala, Panbari, Rani, Barduar, Chaygaon, Pantan, Upper Banbhag, and Patidarang. The silk is reeled from the cocoon, 250 of which yield one oz. of thread. The price obtained is about Rs. 9 per seer.

Eri silk.

The *eri* worm (*attacus icini*) derives its name from the *eri* or castor oil plant (*ricinus communis*) on which it is usually fed. From five to six broods are usually reared in the year, those which spin their cocoons in November, February, and May yielding most silk. As with the *muga* moth, the females when they emerge are tied to pieces of reed, and are visited by the males who are left at liberty. The eggs are hatched in the house and take from a week to 15 days to mature. As soon as the worms appear they are placed on a tray, which is suspended in a place of safety, and fed on the leaves of the castor oil plant. When fully grown they are about $3\frac{1}{2}$ inches long and of a dirty white or green colour. After the final moulting, the worms are transferred from the tray to forked twigs suspended across a piece of reed, and, when they are ready to spin, are placed on a bundle of dried plantain leaves or withered branches which is hung from the roof of the hut. The matrix of the cocoon is very gummy, and the silk, which is of a dirty white colour, has to be spun, not reeled. Before this is done

the cocoons are softened by boiling them in water and a solution of alkali. Empty cocoons yield about three-quarters of their weight in thread.

Only Brahmans, Ganaks, and Kalitas are actually debarred from the rearing of the *eri* worm, but as a matter of fact the industry is largely in the hands of the animistic tribes, such as the Garos, Mikirs and Kacharis. The principal centres of manufacture are in the Barduar Chaygaon, and Pantan mauzas and the Tamulpur and Barama tahsils, and the most important markets are at Rangia, Barama, Palasbari, and Tamulpur. Large quantities of the cloth are purchased by the Marwari merchants for export to Calcutta.

The most useful garment made of *eri* silk is the *bor kapor*, a large sheet sometimes as much as 20 feet in length by 5 feet wide, which is folded and used as a wrap in the cold weather. It costs from Rs. 10 to Rs. 16. *Eri* cloth is also made into coats and petticoats.

Rough pottery is made by Kumhars, who are often a **Pottery** functional section of the Kalitas, and by Hiras, a section of the Namasudras. There are probably about 7,000 persons in the district who are to a greater or a less degree dependent on the making and selling of earthenware for their means of livelihood, but a large proportion of these people are agriculturists as well. The earth used is generally a glutinous clay, which is well moistened with water and freed from all extraneous substances, and if it is too stiff some clean coarse sand is worked up with

it. A well kneaded lump of clay is then placed on the wheel, which is fixed horizontally and made to rotate rapidly. As the wheel revolves the potter works the clay with his fingers and gives it the desired shape. The vessel is then sun dried, placed in a mould, and beaten into final shape with a mallet, a smooth stone being held the while against the inner surface. It is then again sun dried, the surface is polished, and it is ready for the kiln. The collection of the clay and firewood, the shaping of the utensils on the wheel and the stacking of them in the kiln, form the men's portion of the work. The women do the polishing and the final shaping. The Hiras, however, do not use the wheel, but mould the vessel on a board, laying on the clay in strips, and the whole of this work is entrusted to the women.

The instruments employed are the wheel (*chak*), which is about three feet in diameter and rotates on a piece of hard pointed wood fixed firmly in the ground, the mould (*athali*), a hollow basin about 16 inches long by $3\frac{1}{2}$ inches deep, the mallet (*baliya piteni*) and the polisher (*chaki*).

The principal articles manufactured are cooking pots (*ekathia*, *mola*, *daskathia* and *charu*), water jars (*kalah*, *tekeli* and *thali*), and larger vessels (*hari* and *jangu*), with lamps, pipes and drums. Flower pots are manufactured at Gauhati by up-countrymen, and earthenware pipes for ring wells at Barpeta. The profits of the business are said to be small, and the local pottery is being gradually ousted by a superior quality of goods imported from Bengal, and by the metal utensils which are coming extensively into use. The principal centres of the industry

are at Paru, Hirapara (near Palasbari), Rani, Beltala, Durakahara and Khehenipara.

The brass and bell-metal industry is not of much importance. Bell-metal utensils are cast in moulds, but brass vessels are made out of thin sheets of that metal, which are beaten out and pieced together. The implements of the trade consist of anvils of different sizes (*belmuri chatuli*), hammers, pincers and chisels. The furnace is simply a hollow in the floor of the hut, and the bellows are made of goat's skin. When it is desired to join two sheets of brass together, nicks are cut in one edge, into which the other edge is fitted, and the two are then beaten flat. A rough paste made of *pan*, a substance which consists of three parts of sheet brass with one part of solder, and borax is then smeared over the join. The metal is heated, the *pan* melts, and the union is complete. The principal articles manufactured are small flattish bowls often used as drinking cups (*lota, bati*), jars for holding water (*kalsi gagari*), trays (*sarai* and *botas*), boxes to carry betel nut and lime (*tema, temi*), and large vessels used for boiling rice (*thali*). The chief centres of the brass industry are at Hajo and Gauhati, and of the bell-metal trade at Sarthai-bari. The blacksmith's work is of a very simple character, and they only make ploughshares, billhooks or daos. knives, and sickles. Ornaments of gold filigree of really artistic workmanship and design are manufactured at Barpeta.

Metal utensils.

Mats are made from bamboo, *nal* (*phragmites roxburghii*). Mat making.

hi), *patidoia* (*maranta dichotoma*), cane (*calamus* sp.), *mutha* (*cyperus rotundus*), and *sola* (*aeschomyna aspera*). Mats made of the first four materials are plaited by hand, but if *mutha* or *sola* is employed strips of the reed are placed in wooden frames and the mat is woven almost as though it were a cloth. Bamboo mats are made in the Gauhati, Palasbari, and Bajali tahsils and cost from As. 2 to As. 8. *Mutha* and pith mats are made in Chamaria, Chaygaon, Hajo, and Patidarang and cost from As. 4 to Rs. 5. Bamboo sieves are also made in Palasbari and Chaygaon and cost from As. 2 to As. 8.

Lac.

Most of the lac produced in Kamrup comes from the part of the district which lies south of the Brahmaputra and west of Gauhati. The Garos generally rear their lac on the arhar plant (*cajanus Indicus*), while the Assamese prefer some kind of *ficus* or the *kukursola* (*grexia multiflora*) or *moj* (*albizzia lucida*), but, as far as is known, the quality of the product is not affected by the tree on which the insect has been fed. The method of propagation is as follows. Pieces of stick lac containing living insects are placed in baskets and tied on to the twigs of the tree on which the next crop is to be grown. After a few days the insects crawl on to the young branches and begin to feed and secrete the resin. They are left undisturbed for about six months, and the twigs encrusted with the secretion are then picked off. A good sized tree yields from 30 seers to 2 maunds of stick lac, the best results being obtained from trees of moderate growth, which do not contain too rich a supply of sap. Two crops are generally obtained in the year, the first

being collected in May and June, the second in October and November. The first crop is largely used for seed, and it is the second which supplies the bulk of the exported lac. Ants and the caterpillars of a small moth sometimes do much damage to the insect, and a heavy storm at the time when they are spreading over the tree will destroy them altogether. Almost all the lac produced is exported in the crude form of stick lac. Shellac, when made, is prepared in the following manner. The stick lac is pounded and sifted, and then repeatedly washed and dried to free it from all tinctorial matter. When the desired result has been obtained the resin is put into a bag and heated over a slow fire. The bag is squeezed till the melted lac is forced through the cloth, and it is then scraped off and is ready for the market. Sometimes the raw product is treated by a much simpler process, and the stick lac is merely boiled for some hours and then pressed into cakes, which contain of course the whole of the colouring matter. A dye is also prepared by pounding the stick lac into a fine powder, mixing it with water in the proportion of one to four and boiling it for two hours. The tinctorial matter is then strained off and the refuse, which is known as *shera*, is exported.

The fishing industry is of considerable importance in Kamrup. There are in the district about 21,000 members of the Nadiyal and Namasudra castes who are allowed by custom to catch fish for sale, and probably more than half of these depend to some extent at any rate upon their nets for their means of livelihood. The Fishing.

right of fishing in the more important rivers and *bils* is every year put up to auction and fetches between twenty and thirty thousand rupees a year. (For details see Table XIV.) There are altogether 145 fisheries in the district, the most valuable mahals being the Brahmaputra, the Chaulkhoa and Bnelengi rivers, and the Jahna, Kukurmara, and Janparia *bils* in Barpeta. Fish is not salted in Kamrup, but there is a certain amount of trade in dried fish which goes from the Barpeta and Chenga mauzas to Bengal, and from the country south of the Brahmaputra to the Garo and Khasi Hills. The lessees of the Brahmaputra fisheries levy a tax of Rs. 2 or Rs. 3 on each net used, and in the case of large nets like the *lanqi*, which are worked by several men, a tax of Rs. 3 per annum on each man. The best eating fish are hilsa (*clupea ilisha*), roe (*labeo rohita*), chital (*notopterus chitala*), ari (*arius*), magur (*clarius magur*), and pufta (*callichrous bimaculatus*).

Nets used.

The following are the nets most commonly in use:—(1) *Ghakata*, a net in the shape of a shovel which is pushed through the water and is generally used to catch *butchua* fish. (2) *Khewali*, a piece of netting to the centre of which a rope is attached while all round the edges there are weights. The net is thrown flat on to the surface of the water, when the weights sink and drag the sides of the net together. It is then drawn by the rope to a boat or bank. The following names are applied to this net as the mesh decreases in size—*sayani*, *pachani*, *afalia*, *angtha*, *ghanjal*. (3) *Langi*, a large net which is stretched right across a river, the bottom being weighted and the

top buoyed. The fish are then driven towards the net and become entangled in its meshes. The *tenga langi* is a smaller variety, the two ends of which are brought round to form a circle as the net is not long enough to reach across the river. (4) *Parangi*, a square net the opposite corners of which are fastened to flexible bamboos. The net thus hangs like a sack from a stout pole to which the bamboos are attached and is lowered into the water and raised at intervals. The *polo* resembles a gigantic wine glass with a short stem made of wicker-work. It is generally used by women, who walk through shallow water and keep pressing the rim of the glass on the mud at the bottom. Any fish that are caught are removed through an opening at the top. The *jutuki* is a smaller kind of *polo*. The *jukai* is a species of wicker-work shovel which like the *polo* is generally used by women. They place the broad end of the shovel on the ground before them, and trample up the mud so as to drive the small fry into it. Conical bamboo traps, which are called *dingaru*, *thupa*, *sepa*, and *gui* and are worked on the principle of the lobster pot, are placed in small streams or running water near the rice fields.

CHAPTER VI.

CONDITION OF PEOPLE—COMMUNICATIONS—TRADE.

Sub-tenancy—Wages—Prices—Food and dress—Dwellings—Economic condition of the people—Conventional restrictions—Development of steam navigation—Railways—Roads—Water communications—Post and telegraph—Trade—Fairs—Towns—Local Boards.

Sub-tenancy. There are large *nisfi-khiraj* and *lakhiraj** estates in Kamrup, and the area of land sublet is considerably larger than it is in the upper districts of the valley. At the last settlement statistics of sub-tenancy were collected for nearly nine-tenths of the total settled area; and it was found that nearly 25 per cent of the land with regard to which information

was recorded, was occupied by tenants. The proportion returned for each of the groups into which the district was divided is shown in the statement in the margin. No rent law has as yet been introduced, as it is thought that in a comparatively sparsely peopled district like Kamrup there is not much danger of rack renting. Rents are paid either in cash or kind, or by a

* *Nisfi-khiraj* estates pay half the ordinary rates of revenue, *lakhiraj* estates are revenue free. The history of these estates will be found in Chapter VII.

combination of the two systems. Of grain rents there are several varieties. Tenants holding land on the *adhi* tenure hand their landlord half the actual produce of the fields; whereas, in the case of *chukti adhi*, a fixed quantity of grain is given irrespective of the total yield. Sometimes the crop is divided before it is threshed (*dal adhi*), sometimes after (*guri adhi*). In the case of cash rents the Government revenue is the rate ordinarily charged, but the land is usually measured up with a rod that is only $7\frac{1}{2}$ or 7 cubits in length instead of the standard measurement of 8 cubits. This in itself gives the landlord a profit of 5 or 30 per cent, and, in addition to this, he often either levies cesses on his tenants, or requires them to work for a certain time in his own fields. Typical cesses are *salumi* from 8 annas to Rs. 2; camp expenditure 6 annas; and contributions towards the cost of weddings or pujas.

The ordinary daily wage is said to be four or five annas Wages. a day. There is no regular landless labouring class, but since the earthquake of 1897 it is not so difficult to obtain labour as it was. Ploughmen are sometimes paid in grain, and sometimes are allowed to use their employers' bullocks in their own fields for one day out of every three. The villagers often combine to help one another to get in the harvest, the owner of the field rewarding his assistants by a good meal. Servants hired by the month receive from Re. 1 to Rs. 7 as wages. In many cases these men are what is known as *bandhas*. A man who is in need of ready cash receives a lump sum down, and enters into an agreement to work for his creditor till the full amount

has been redeemed. He is fed and clothed, and each year's labour is usually set against a certain portion of the advance. Occasionally it is only set against the interest, and, where this is the case, the loan can never be worked off. These *bandhas* are usually very kindly treated, and it is obvious that, if they choose to leave their masters, a civil suit for the balance of the sum due affords a very insufficient remedy, as such a person is not likely to have any property from which it would be possible to satisfy the civil court's decree.

Prices.

subject to striking variations. The average price recorded for each of the four decades ending with 1902 was 17·3 ; 15·5 ; 16 ; and 12·5 seers for a rupee. The high average during the last decade was largely due to famine in India and several poor harvests in Kamrup. The prices obtained by the raiyats for their surplus produce vary very considerably in different parts of the district. At Rangia, the price paid for ordinary white rice seldom falls below Rs. 2 per maund, even at harvest time, but in less accessible localities the price is sometimes very low. In Bajali, unhusked rice sells at about 40 to 45 seers for the rupee on the river bank near the trader's boat ; but the price falls in direct proportion to the distance from which

the boatmen have to carry the grain. In some villages the rate is as low as 60 seers for the rupee and occasionally even less than this, but the owners could always obtain the higher price if they chose to carry their produce down to the boats themselves. Prices such as these are low enough, but the profits of the boatmen, who purchase the rice in the mofussil and sell it again in Barpeta or Gauhati, do not appear to be excessive.

Mustard generally brings the raiyat about Rs. 3 per maund. The price of salt has fallen during the last quarter of a century, and so has that of pulse, though not to a very marked degree. Table X shows the price of common rice, pulse, and salt recorded at Barpeta and Gauhati in 1880, 1890, 1900, and subsequent years.

The staple food of the people is boiled rice, eaten with **Food.** pulse, spices, and fish or vegetable curry. Amongst the well-to-do, pigeon or duck occasionally take the place of fish, but fish is a very common article of diet, and is said to be a substitute for *ghi* which is not very largely used. Goats' flesh is eaten by Muhammadans and members of the Saktist sect, and venison is always acceptable, and is frequently procurable, especially in times of flood, when the deer are driven on to islets of higher land and are ruthlessly slaughtered from boats. Tea drinking is very common, especially in the early morning. Sweetmeats usually consist of powdered grain mixed with milk, sugar, and *ghi*.

The ordinary form of dress for a villager is a cotton **Dress.** *dhoti* or waistcloth, with a big shawl or wrapper, and

sometimes a cotton coat or waistcoat. Women wear a petticoat, a scarf tied round the bust, and a shawl. These clothes used originally to be all home made, but of recent years imported fabrics have been largely coming into favour. Cheap woollen blankets are also worn in the cold weather, a fashion that has much to recommend it as the Assamese are often very lightly clad in winter. Silk is not as generally worn as in Upper Assam, and the women do not seem to have as much jewellery as their sisters in Sibsagar. Boots and shoes are the exception, and in their own homes even well-to-do people wear wooden clogs. Wooden sandals are also used by villagers when travelling or working in jungle ground, where there are tufts of sharp-pointed grass.

Dwellings.

The house of the ordinary villager consists of three or four small and ill-ventilated rooms, built round three sides of a court-yard. The walls are usually made of reeds plastered over with mud, the roof of thatch supported on bamboos, the floor of mud. In Kamrup, the enclosure is often entered through a little room intended for the reception of guests, a refinement which is seldom seen in the homestead of the ordinary villager further up the valley. The materials required for the construction of a house do not, as a rule, cost the proprietor anything but the labour of procuring them ; but the houses are small and generally badly built. The furniture of the cultivating classes is simple, and consists of a few boxes and wicker-work stools, brass and bell-metal cooking utensils, earthen pots and pans, baskets and bottles, and perhaps a loom. The villager sometimes sleeps on a

small bamboo *machan* or platform, sometimes on a mat on the floor, but the middle classes have beds, tables, and chairs in their houses.

The local revenue officials are of opinion that a considerable proportion of the people are in debt ; but it is doubtful whether this indebtedness is serious, as, apart from the standing crop, the poorer raiyats have no security to offer. The rate of interest charged is said to vary from 10 to 75 per cent, but for small loans it is generally either one anna or two pice in the rupee per mensem. The Settlement Officer (Mr. Barnes) seems to be of opinion that there is little genuine poverty in Kamrup. Of the Bajali group, which is certainly not the richest part of the district, he says that, though the ordinary raiyat is poor, he is able to maintain himself on his land in independance and without difficulty. Cash is generally scarce and little grain is stored, but this is hardly matter for surprise as the people seem to take life fairly easily. Of the Barbhag group, which has a density of 521 to the square mile, the Settlement Officer writes as follows:—" The landlords are on the whole fairly well off, though there are very few wealthy men amongst them. They were undoubtedly rather hard hit by the sudden rise in the demand in 1893-94, though they can well afford to pay. The Brahmans and Ganaks have other sources of income besides agriculture. The independent cultivators in the good villages are generally well off but without much money. In the bad villages they are distinctly poor, and have generally come down in the world owing to the deterioration of their land. They spend large sums

Economic condition of the people.

on marriage; a Brahman's marriage is said to cost between Rs. 1,000 and Rs. 1,200 and that of a Sudra not less than Rs. 200. A certain amount of debt is the result." In the south of the Patidarang group the conditions are said to be much the same as those in the Barbhag group, but in the north of Panduri, the south of Kaurbaha, and the north of Pub Kachari Mahal the raiyats are described as "distinctly poor." The people obtain the cash they require to pay their land revenue by the sale of surplus dhan, mustard, and pulse, garden produce, *eri* cloth and thread, and lac. The Brahmans earn considerable sums by going to Bengal as priests, and at the other end of the social scale are the Kacharis, who earn almost as much by working on the tea gardens. A certain number of people work on the roads for the Public Works Department or the Local Board, while others hollow out canoes for sale. The villagers are, however, probably not so well to do as those of Upper Assam, where the tea industry puts an enormous amount of cash into circulation. On the other hand they spend much less on opium. Silk is not as generally worn as in Sibsagar, and the women do not own much valuable jewellery.

Convention-
al restric-
tions.

The inhabitants of Kamrup are not encumbered by many conventional restrictions. All castes catch fish for their own consumption, but only the Doms or Nadiyals, the Charals or Namasudras, and the animistic tribes of Bodo origin will sell it. Brahmans, Ganaks, and Kayasthas decline to cultivate the *eri* worm; but, apart from this, there are few restrictions imposed by caste

which are not common to the rest of India. All over the district, Hindus decline to touch the plough on the last day of the month, the day of the new moon, and the day when the moon is eleven days old; and here and there certain days in the week are considered to be inauspicious. In Rangia tahsil, for instance, a Tuesday or a Saturday is thought to be the appropriate day on which to begin ploughing or to sow summer rice; but they are the only two days in the week on which *sali* dhan must not be sown, and in the Nalbari tahsil they are close days as far as house building is concerned. In the Bajali tahsil the restrictions seem to be vexatiously minute. *Sali* dhan must not be sold on Mondays and Thursdays, and revenue is not paid on those days. *Ahu* dhan is not sold, or even given away, on Saturdays and Tuesdays; and Sunday and Monday are days on which no prudent person would plough his fields or sow the seed.

At the time when we first came into possession of the Province, the difficulty of communications proved a most serious obstacle to its development. The Brahmaputra was the great highway which connected this portion of the Company's dominions with Bengal, but the journey up the river for any boat of ordinary size was a very lengthy business. McCosh, writing in 1837, stated that a large boat took from six to seven weeks to come from Calcutta to Gauhati, though the post, which was conveyed in small canoes rowed by two men, who were relieved every fifteen or twenty miles, reached Gauhati in ten days.*

* Topography of Assam—pages 9 & 82.

**Beginning of
steam
navigation.**

This was the state of things for twenty-two years after our annexation of the valley, but in 1848, the Government steamers were deputed to ply between Calcutta and Gauhati. Three years later, the Commissioner, Major Jenkins, made the not unreasonable proposal that three or four times a year they should be allowed to proceed right up the valley to Dibrugarh. His suggestions were negatived by the Marine Department, on the ground that the voyages would be financially a failure, but his views were strongly urged on Government by Mr. Mills, when he visited the Province in 1853. The proposal met with the approval of the Lieutenant-Governor, instructions were issued for the despatch of a steamer in that year, and several voyages were made, with results that were not unsatisfactory even from the financial point of view. The journey from Gauhati to Dibrugarh and back occupied no more than fifteen days, an extraordinary contrast to the interminable delay of the same voyage in a country boat. The cargo tendered soon exceeded the carrying capacity of the steamers, and in 1855 Lieutenant-Colonel Jenkins complained that the vessels reached Gauhati fully laden with goods shipped in Upper Assam, so that Gauhati and the ports below derived practically no advantage from the downward service of the steamers.

As was only to be expected, the rates at first charged were fairly high, and a ticket from Calcutta to Gauhati cost no less than Rs. 150. On the other hand, the accommodation was designed on a very liberal scale. The regulations issued in 1851 expressly authorised

passengers to carry pianos in their cabins free of freight, provided that they were required for use during the voyage and were not in packing cases ; a proviso which suggests a very deliberate voyage as compared with the speedier travelling of the twentieth century. Freight on ordinary stores seems to have been charged at the rate of one rupee per cubic foot between Calcutta and Gauhati, but for some time longer a great part of the trade of the Province continued to go by country boat. The planters could never count on being able to despatch their tea by steamer, and were thus compelled to keep up an establishment of country boats, and having got the boats to use them, and the same objection held good in the case of native merchants.* The cost of working the line was heavy, but, in spite of this, it showed a fair profit, and it was evident that there would be a great development of the traffic if only facilities were provided for it.

In 1860, the Indian General Steam Navigation Company entered into a contract to run a pair of vessels every six weeks, provided that the Government boats were taken from the line. Since that date the steam navigation of the Assam Valley has been in the hands of this Company, and the River Steam Navigation Company, with whom they are associated. But in spite of the existence of a regular service, and the quickening effects of private enterprise, travelling still continued to be very slow. The steamers did not profess to run to scheduled time, the delay at the larger ports for the

Private
steamers
put on the
river.

* Memorandum by the Director of Public Instruction, Bengal, dated the 7th February 1867.

loading and unloading of cargo was considerable, and the passenger no doubt often required his piano to beguile the tedium of the way. In 1861, the Commissioner, Colonel Hopkinson, was disposed to take a gloomy view of the condition of affairs, and, in a letter to Government, openly gave expression to the opinion that it would be better to compensate the planters for any loss they might sustain, and abandon the Province, unless Government were prepared to enter upon a course of vigorous material improvement. In the same letter, he drew the following dreary picture of the isolation of Assam :—

“ With the furious current of the Brahmaputra, still unconquered by steam, opposing a barrier to all access from without, and not a single road fit for wheeled carriage, or even passable at all for a great portion of the year, there is such an absence of the full tide of life running through Assam, such a want of intercourse between man and man, as does and must result in apathy, stagnation, and torpidity, and a terrible sense of isolation, by which enterprise is chilled and capital and adventurers scared away. The profits of tea cultivation should attract hundreds where tens now come, but the capitalist is not always to be found who will venture his money in a country to which access is so difficult as it is to Assam, through which his correspondence travels at the rate of a mile and a half an hour, and in which it may take a month to accomplish a journey of two or three hundred miles; nor, on the other hand, is it every spirit, however bold, that cares to encounter so dreary a banishment, and to be so entirely cut off from his fellows in a place from which exit is only possible at rare intervals, and must be so literally a prison or tomb to him. ”

The daily
mail service.

Matters, however, gradually improved, and in 1884, a daily service of mail steamers was started between Dibrugarh and Dhubri, connecting with a steamer which plied between the latter place and Jatrapur.

Here the traveller who was pressed for time could take the train to Calcutta, though the line was not of the most comfortable, as more than one river had to be crossed in boats before the capital of Bengal was reached.

The introduction of a daily steamer service represented an enormous advance in the facilities for communication between Assam and the outer world. The large steamers were not uncomfortable, but progress was slow, and not only the hour, but the date on which they left any given port was far from certain. The would-be traveller could not choose his own time for starting on his journey, but had to select a date on which a steamer was expected at the nearest ghat, and even then he not unfrequently had to endure a weary period of waiting by the river bank. The daily service changed all that and combined the advantages of regularity with a speed which, in comparison with that attained by the large cargo boats, was most commendable.

The ports of call in Kamrup are Kholabanda for Barpeta, Palasbari, Soalkuchi, and Gauhati itself.

At the present day (1905) two steamers ply daily between Gauhati and Dhubri. One, which carries the mails, does not call at any of the intermediate ports and is supposed to do the up journey in twenty hours and the down in eleven. The other belongs to the service which runs between Goalundo and Dibrugarh and calls at each of the ghats mentioned above.

The Gauhati branch of the Assam-Bengal Railway runs ^{The Rail-} for a distance of $33\frac{1}{2}$ miles through the district, eastward ^{way.}

to the boundary of Nowgong. There are stations at Panikhaiti, Digru, and Khetri, but, as this portion of the district consists to a great extent of hills and marshes, it has not been much affected by the opening of the line. A line is now (1905) under construction from the north bank of the Brahmaputra opposite Pandughat, which will connect with the Eastern Bengal State Railway. On its completion there will be through railway communication, not only between Calcutta and Gauhati, but between Calcutta and Dibrugarh, though the Ganges and the Brahmaputra will still have to be crossed by ferries.

**The roads
on the south
bank.**

South of the Brahmaputra, the main artery of communication is the great trunk road, which runs the whole length of the valley from Fakirganj opposite Dhubri to Saikhoa opposite Sadiya. It enters Kamrup from Goalpara at the 48th mile and runs northward and eastward till it reaches the river at Palasbari. From Gauhati it turns southwards, and for eleven miles is a section of the Gauhati-Shillong road, but it then bends again sharply to the east, and enters the Nowgong district near Nakhola. There are inspection bungalows at Dhupdara (in the Goalpara district) 49 miles, Boko 37 miles, Chaygaon 26 miles, and Palasbari 15 miles west of Gauhati, and at Amrigog 9 and Sonapur 19 miles east of that town.

The only other roads of any importance south of the Brahmaputra are the road which runs eastward from Gauhati to Sonapur, and the roads connecting Barduar with Chaygaon, Palasbari (13½ miles), and the trunk road at a point 9 miles from Gauhati (19 miles).

The north trunk road enters the district from Goalpara at Raha, and leaves it at Dumnichauki, where the Barnadi forms the boundary between Kamrup and Mangaldai. There are inspection bungalows at the following places, going from west to east; the figures in brackets indicate the length of the stage. Raha, Halapakri ($6\frac{1}{2}$ miles), Bhawanipur ($9\frac{1}{4}$ miles), Patacharkuchi (13 miles), Barama ($7\frac{1}{2}$ miles), Nalbari ($8\frac{1}{2}$ miles), Rangia ($11\frac{1}{2}$ miles), Kamalpur (8 miles), Dumnichauki ($8\frac{3}{4}$ miles). From North Gauhati three roads run, to Dumnichauki, to Naokata, and to Nalbari. On the Naokata road there are inspection bungalows at Chutiapara (9 miles), Sutargao (10 miles), and Naokata (15 miles). On the Nalbari road there is an inspection bungalow at Hajo (14 miles), from which point it is 18 miles to Nalbari. The section between Hajo and Nalbari was injured by the earthquake of 1897, and there are places which are at present (1905) unfit for wheeled traffic in the rains. From Rangia a road runs to Darranga (26 miles), and from there there is a difficult footpath to the frontier village of Dewangiri, and a rough driving track to Subankhata. From Barama a road runs eastward to the boundary of Mangaldai, 29 miles away, passing Tamulpur, where there is an inspection bungalow, on the 17th mile. The Chapaguri mauza is tapped by a road which runs from Patacharkuchi to Kakilabari, where there is an inspection bungalow on the 16th mile. The roads and tracks in the western portion of the district can best be understood by a reference to the map which accompanies this volume. Most of the minor streams are

The roads on the north bank.

spanned by bridges, but there are no less than 45 ferries in the district which are still maintained across the larger rivers. With the exception of a section of the trunk road west and south of Gauhati, all of these roads are unmetalled, and are liable to be much cut up if asked to carry heavy traffic in the rainy season. In 1903-04 there were altogether 547 miles of cart road and tracks maintained either by the Local Boards or the Public Works Department in Kamrup.

**Navigable
rivers.**

In the rainy season the rivers of the district are largely used for the removal of grain and other produce from the interior. The following statement shows in a concise form the principal rivers used as trade routes, and the extent to which they can be so used in the wet and dry season: —

Names of rivers.	Highest point to which a boat of 4 tons burthen can proceed in the

The mails from Calcutta are at present carried by steamer from Dhubri, and are dropped at Kholabanda ghat for Barpeta, and at Gauhati. A list of the post and telegraph offices in the district will be found in the appendix (Statement B).

The wealthiest and most important traders in Kamrup are the shrewd Marwari merchants, locally known as Kaiyas. Most of the import trade is in their hands, and they bring up from Calcutta piece goods, clothes and blankets, grain and pulse of various kinds, salt, oil, ghi, cement, corrugated iron, metal utensils, and thread. The chief exports of the district are mustard seed, lac, unhusked rice, hides, and timber. The Kaiyas are the principal exporters of the district, but in the Barpeta subdivision, the wits of the people seem to have been sharpened by the unpleasant character of their surroundings.

Commerce and Trade.

The Assamese traders of this quarter are not content with buying up the mustard crop in the vicinity, but they extend their operations to Upper Assam, and in the rains their boats are to be found as far east as the Majuli.

Gauhati and Barpeta are the most important trading centres. The number of shops owned by Marwaris in the interior is not so large as it is in Upper Assam; and the village shopkeeper, who retails salt and oil from a small grass hut, is generally a much less important person than the Kaiya. The principal trading villages are Palasbari, Nalbari, Hajo, and Rangia. A list of all the villages in which there are three or more permanent shops will be found in the appendix (Statement C). A good deal of business is also transacted at the *hats* or markets where the raiyats meet on certain days in the week to exchange the products of their farms. A list of these markets will be found in the appendix (Statement D).

Bhutila fairs. Trans-frontier trade is carried on with Bhutan at Dar-ranga and Subankhata. The sites of these frontier fairs are picturesque enough. Immediately to the north are the tumbled masses of the Bhutan Hills, whose outer ranges, unlike the mountains of Upper Assam, are singularly destitute of forest. The plain is for the most part covered with short turf, dotted over here and there with patches of high grass and an occasional khair tree. There are no villages in the vicinity, but every winter grass huts are built for the occupation of the Marwari merchants and the traders from Barpeta who fre-

quent the place. The Bhutias come down in considerable numbers with lac, wax, chillies, blankets, ponies, donkeys, and goats. They sell these things to the traders, and with the proceeds buy cotton thread and cloth, rice, *eri* cloth and thread, and brass vessels. In the latter articles there is a considerable trade, and Morias come from Gauhati to manufacture the large brass cans which the Bhutias use to distil their country spirit. The trade is generally transacted on a cash basis, though the hillmen sometimes barter salt and chillies for rice; the usual rate of exchange being three or four baskets of rice for one of salt, and two of rice for one of chillies. Starting from these centres, the Bhutias travel about the country and traffic with the villagers and the traders in the interior. The big stout men, with their dirty rather insolent looking faces, and their layers of filthy clothing, are a common sight in Kamrup in the cold weather, as they march about the roads with huge baskets of merchandise on their backs, and strings of shaggy little mules, donkeys, and ponies.

The other fairs held in the district are not at present of very much importance. A list of the places where these fairs are held will be found in the appendix (Statement E). Most of them are connected with some religious festival.

Gauhati town (Goa-hathi=high land covered with areca-nut trees) is situated on the left bank of the Brahmaputra river in $26^{\circ}11'$ N. and $91^{\circ}45'$ E. It lies on the trunk road from Bengal to Sadiya, and is at present the terminus of the Assam Valley Branch of the Assam-

Municipal-
ties. Gau-
hati.

Bengal Railway, though a line is under construction along the north bank of the Brahmaputra, which will connect it by rail with Calcutta. An excellent metalled road runs from the steamer ghat to Shillong, the headquarters of the Local Administration.

A steam ferry crosses the Brahmaputra at this point, and the place is a port of call for the river steamers. The town is growing very slowly, and the population in 1872, 1881, 1891, and 1901 was 11,492, 11,695, 8,283, and 11,661 respectively. The figures for the two earlier years include the population of North Gauhati. The population of North and South Gauhati in 1901 was 14,244. The bulk of the population, as in most of the towns of Assam, is composed of foreigners. Modern Gauhati is identified with Pragjyotishpur, the capital of king Bhagadatta, who is mentioned in the Mahabharata; and when Kamrup was conquered by the Ahoms it became the residence of the viceroy of Lower Assam. The extensive earthworks which protect it on the land side, the numerous large tanks, and the brick and masonry remains which are found in every direction beneath the soil, all clearly show that the place was originally an important city with a considerable population, which occupied both banks of the Brahmaputra. The town which lies on the north of the river is said to have been built by the Koch king Parikshit, who flourished at the end of the sixteenth century; and at the time of Mir Jumla's invasion Gauhati is described as lying north of the Brahmaputra.* By the end of the eighteenth century it had

* *Vide J. A. S. B. No. I, Part I, 1872, p. 69.*

fallen from its high estate, and Buchanan Hamilton, writing in 1809, describes it as a "very poor place." From 1826, when Assam was ceded to the British, till 1874, when the Province was separated from Bengal, Gauhati was the seat of the Local Government, and it is still the headquarters of the Commissioner and of the Judge of the Assam Valley districts, as well as of the ordinary district staff. The most noteworthy event in its recent history was the earthquake of 1897, which destroyed all the Government offices and wrecked every masonry building in the place. The town has since been re-built, and hardly any traces are now to be seen of this great catastrophe. The situation of Gauhati is extremely picturesque. To the south it is surrounded by a semi-circle of thickly-wooded hills, while in front rolls the mighty Brahmaputra, which during the rains is more than a mile across. In the centre of the stream lies a rocky island, the further bank is fringed with graceful palms, and the view is again shut in by ranges of low hills. Such a site, though beautiful, is far from healthy, and at one time the mortality in the town was very high. Improvements in the drainage and water-supply have done much to remedy this defect, but owing to its sheltered situation and the comparatively low rainfall (67 inches) the climate in summer is rather oppressive.

Gauhati was constituted a municipality, under Act V (B.C.) of 1876, in 1878; and Act III (B.C.) of 1884 was subsequently introduced in 1887. The town has an area of 2.95 square miles, and in addition to the Shillong-Gauhati cart road, which is maintained by the Public

Works Department, there are 14 miles of road kept up by the municipality, of which $9\frac{1}{2}$ are metalled. There are ten members of the Municipal Committee, six of whom are elected, and up to date the Deputy Commissioner has always filled the post of Chairman. The principal taxes are a tax of $7\frac{1}{2}$ per cent on the annual value of holdings, a latrine tax, and a water rate. The average municipal receipts and expenditure in the ten years ending with 1903 were Rs. 43,000, the chief sources of income being taxes on houses and lands (Rs. 6,500), water rate (Rs. 8,200), revenue from markets and slaughter houses (Rs. 5,500), and contribution (Rs. 10,100). The chief items of expenditure were water-supply (Rs. 13,000) conservancy Rs. (11,800), and public works (Rs. 7,400). The water-supply is pumped from the Brahmaputra, passed through filtering beds and distributed through standpipes all over the town. Since the completion of these works in 1887, cholera, which used to be very prevalent, has almost disappeared. The present source of intake is, however, situated in the centre of the town, and in a dry season is liable to be landlocked. A large sum has accordingly been sanctioned for the removal of the pumping station and filtering beds to a point above the town. Gauhati is the principal centre of trade in Lower Assam.

Barpeta.

Barpeta was formed into a municipality under Act V B. C. of 1876 in 1886. The committee consists of seven gentlemen nominated by Government under the presidency of the Subdivisional Officer. The principal tax levied is a cess at the rate of $5\frac{1}{2}$ per cent on the annual value of holdings; but considerably more than half the ordinary

income is derived from a grant made by Government, and from the fees levied on pounds, markets, and ferries. The actual incidence of taxation in 1903-04 was only As. 6-3 per head. The inhabitants of the town resent having to pay even this small sum, and have more than once petitioned for the abolition of the municipality. The area of the town is 1·37 square miles, and there are nearly 15 miles of road within municipal limits, but none of these roads are metalled. There is no attempt made to light the town and, though there are seven masonry wells, the inhabitants for the most part draw their water from small wells sunk inside their compounds. Barpeta is chiefly famous for the great Mahapurushia *sattrā* founded by the Vaishnavite reformer Sankar Deb at the end of the fifteenth century. The ground surrounding the *sattrā* is considered holy, and is crowded with huts huddled together in the most insanitary propinquity. The Mahapurushias have strong religious prejudices against vaccination, and when small-pox breaks out, it rages with exceptional severity, an epidemic which occurred in 1895, causing a mortality of 36 per mile from this disease alone. It is thus no matter for surprise that the population of the town does not increase ; and, though the birth-rate is unusually high, the population, which in 1881 was 11,332, fell at each successive census, and in 1901 was only 8,747. The town was at all times liable to flood, and since the earthquake of 1897, most of it goes under water in the rains. It is the headquarters of the Subdivisional Officer, and the public buildings include a hospital, court

police station, and high school. The manufactures are not of much importance and chiefly consist of 'canoes, earthenware well rings and other pottery, and really artistic gold filigree work. There is, however, a considerable trade in rice, pulse, and mustard, and the merchants of Barpeta extend their operations as far as the Majuli in Sibsagar.

There are no other places in the district which can be dignified by the name of town.

Local
Board's
History.

In the early day of British administration there was little money available for public works of any kind, and what there was was generally expended under the control of the Public Works Department or the District Magistrate.

In 1872, the management of the district roads was entrusted to a committee presided over by the Deputy Commissioner. The funds at their disposal were partly obtained from tolls and ferries on local roads and other miscellaneous sources, but principally from grants made by the Bengal Government from the amalgamated district road fund. In 1874, when Assam was erected into a separate administration, the Government of India assigned one-seventeenth of the net land revenue for local purposes. The district improvement fund was then started, and the administration of its resources was, as before, entrusted to the Deputy Commissioner assisted by a committee. The actual amount placed at their disposal was not large, and in 1875-76 the total income of the district funds of the Province was only Rs. 1,85,000,

which was a small sum in comparison with the twelve and a half lakhs of rupees received by the Local Boards in 1903-04. In 1879, a regulation was passed providing for the levy of a local rate, and the appointment of a committee in each district to control the expenditure on roads, primary education, and the district post. Three years later the district committees were abolished by executive order, and their place was taken by boards established in each subdivision, which are the local authorities in existence at the present day. The Deputy Commissioner is Chairman of the board of the headquarters subdivision ; the Barpeta board is presided over by the Subdivisional Officer.

The Local Boards are entrusted with the main-
Functions.
tenance of all roads within their jurisdiction, with the exception of the two trunk roads and the road from Barpeta to the steamer ghat, the provision and maintenance of local staging bungalows and dispensaries, and the supervision of village sanitation, vaccination, and the district post. They are also in charge of primary education, subject to the general control of the Education Department, and are empowered to make grants-in-aid to schools of higher grade, subject to certain rules. For these purposes, they have placed at their disposal the rate which is levied under the Assam Local Rates Regulation of 1879, at the rate of one anna per rupee on the annual value of lands, as well as the surplus income of pounds and ferries, and some minor receipts. The principal heads of income and expenditure are shown in Table XVII. The annual budgets of

the Boards are submitted to the Commissioner for sanction. The estimates for all works costing Rs. 500 or over must be submitted to the Public Works Department for approval, and important works, requiring much professional skill, are made over for execution to that department. Less important works are entrusted to the board overseers.

The following statement shows the constitution of the Local Boards in the district, and the mileage of cart roads maintained by them in 1901.

Name.	Area in square miles.	Population.	MEMBERS.					Mileage of cart roads.
			Total number.	European.	Native.	Official.	Elected.

CHAPTER VII.

GENERAL ADMINISTRATION.

Land revenue—Native system—Early British settlements—The settlement of 1893—The settlement of 1903—Established and fluctuating cultivation—Annual and periodic leases—Settlement staff—Land tenures—Collection of land revenue—Unsettled waste—Excise—Opium—Country spirit—Laopani—Ganja—Income tax—Stamps—Public Works—Administration of justice—Volunteering—Police—Jail—Education—Medical aspects—Surveys.

The system in force under the Ahom kings was one of personal service. The whole of the adult male population was divided into bodies of three men called *gots*, each individual being styled a *paik*. One *paik* out of the three was always engaged on labour for the state, and while so employed was supported by the remaining members of his *got*. In return for his labour each *paik* was allowed 8 *bighas* * of rupit land, and the land occupied by his house and garden, which is now called *basti*, free of revenue. Any land taken up in excess of this amount was assessed at Re. 0-4-0 a *bigha*. In addition to this each house seems to have given about one rupee's worth of silk to the Raja and to have paid a tax of one rupee per plough. Buchanan Hamilton, writing in 1809, states that each parganna was let for a term of years to a Chaudri, who made what profit he could out

Land Revenue. Native system.

* One acre=3.025 bighas.

of land held in excess of the *paiks*' free grants. The Chaudris are said to have retained for their own use three-fifths of the gross collections, and to have treated the raiyats in a very oppressive manner. The nominal rent per plough of land in Kamrup was Rs. 2, but the exactions of the chaudri raised it from Rs. 5 to Rs. 7. The yield of a plough was said to be 79 maunds of "rough rice" and 16 maunds of mustard seed. Estimates of yield prior to the era of crop experiments were generally too high, so that the area of a plough was probably between four and five acres, and the rates exacted by the Chaudri must at that time have seemed oppressive. Permission to export mustard was only given on payment of five baskets of rice. North of the Brahmaputra, the whole of the profits of agriculture were, according to the same authority, absorbed by the Government or the hill tribes, each power sending a force, which took as much as possible from the cultivators.

Early
British set-
tlements.

On the occupation of the country by the British the system of compulsory labour was abolished, and the *paik* land was assessed to revenue. A regular land-tax was then introduced in place of the poll-tax, and the country divided into mahals. Annual settlements of these mahals were made with men who were simply collectors of revenue, selected from the more respectable but impoverished Assamese families. In 1834-35, a further change was made, and leases for terms of years began to be introduced. At the same time the collector of revenue was partially transformed into the present mauzadar, by being made a contractor for the amount of the assessment, and paid

by any extension of cultivation which might occur during the continuance of his lease. In 1861, a slight enhancement was imposed, and the revenue rates per *bigha* were raised to 6 annas for *rupit* and 4 annas for other land.

In 1865, the Commissioner, Lieutenant-Colonel Colonel Hopkinson's settlement. Hopkinson, proposed to discriminate between *basti* or garden and other land, and to raise the *bigha* rates to Re. 1 for *basti*, 10 annas for *rupit*, and 8 annas for other land. No detailed enquiries were made; there was no attempt to estimate the comparative value of the three different classes of land; there was no discrimination between good and bad land in the same class or even between district and district. The revised rates were, however, so moderate that it was never seriously contended that they would have an oppressive incidence even on the worst land on which they were imposed. Colonel Hopkinson was of opinion that the existing assessment was ridiculously low, and, in support of his opinion, pointed out that in 1864-65 the receipts from opium were about four lakhs of rupees more than the total land revenue of his division, an excess which in those days represented a difference of about 40 per cent. The new assessment was successfully introduced in 1868-69, and in spite of the enormous enhancement the revenue was collected without difficulty.

The next settlement was made in 1893. The three-fold The settlement of 1893. division of land was retained, but instead of imposing the same rate on all land of the same class throughout the district, the villages were divided into four grades and

the rates assessed varied with the grade of the village. * The villages were provisionally graded by the Director of Land Records and Agriculture, the class in which each village was placed being determined by the demand for land, and not by any intrinsic considerations of the value of the produce, the fertility of the soil, or the profits of cultivation. The demand for land was estimated by ascertaining the density of the population, the proportion of settled to unsettled land, and the proportion of fluctuating cultivation. These lists were sent to local officers for examination, and were modified by them in view of the fertility of the soil, the facilities for bringing the produce to market, and the rents paid by sub-tenants where ascertainable. This enquiry was carried out by the ordinary district staff within the space of a single cold weather, and the results obtained made no pretensions to scientific accuracy. Such accuracy was considered to be unnecessary, as it was not intended to impose anything like the maximum assessment on the land. The Government had no desire to assess up to its fair share of the value of the produce of the soil, and under these circumstances it was contended that it would be waste of time and money to have recourse to any minute and

* The following rates per bigha were imposed.

Class.	Basti.		Rupit.		Faringati.	
	Rs.	as.	Rs.	as.	Rs.	as.
1st	1	6	1	0	0	12
2nd	1	4	0	14	0	10
3rd	1	2	0	12	0	9
4th	1	0	0	10	0	8

elaborate classification of the soils, to crop experiments on a large scale, or to a close examination of all the elements that affect the net profits of the cultivator. The theory on which the settlement was based, was that the worst lands were capable of bearing the assessment imposed, and that Government alone was a loser by its inequalities. Subsequently the idea gained ground that the assessment was not as low as had been at first supposed. The earthquake of 1897 seriously injured a considerable tract of land, either by covering it with sand or by rendering it liable to flood. The total land revenue demand of the district was, accordingly, reduced by Rs. 60,000 in 1901-02.

The resettlement which was begun at the close of 1902 was carried out in a much more elaborate and scientific manner than any of its predecessors. While the maps and records were being brought up to date, the Settlement Officer made detailed enquiries with the object of ascertaining the classes into which the land could be most suitably divided, and the relative value to be allotted to each class. The unit of settlement was what is known as the soil unit. Each soil unit pays a certain quantity of revenue, the actual sum assessed per soil unit varying with the village. To every *bigha* of land is assigned a certain number of soil units, the number varying with the class of land concerned. Thus in every *bigha* of first class homestead land, there were 24 soil units, whereas in every *bigha* of badly flooded land there were only 5, and whatever revenue might be assessed on badly flooded land in the village, first class

The settle-
ment of 1903.
The soil
unit.

homestead land, if there was any, paid nearly five times as much. The data used when determining the number of soil units to be allotted to each class of land were (1) the local enquiries of the Settlement Officer and his Assistants, (2) experiments made with the view of ascertaining the average quality of the crop, (3) the opinions expressed by certain selected persons, and (4) the views of the raiyats, who were consulted as much as possible. Considerable weight was attached to the opinions of the raiyats, as it was thought that they at any rate should know the comparative value of the different kinds of land they held. It will be seen that the process of differentiation was carried much further at the new settlement than at the one which preceded it. In 1893, the maximum rate per *bigha* in a village could never be more than double the minimum. In 1903, the maximum rate might be nearly five times the minimum. In 1893, all land in the village followed the class of the village. In 1903, there was no such restriction, and a small area of poor land in an otherwise rich village could be assessed on its own merits.

Value assigned to each soil unit at the new settlement.

After the maps and records had been brought up to date, a special staff was deputed to determine the class into which each field or homestead fell. The total number of soil units in the block, or group of several mauzas into which for re-assessment purposes the district was divided, was then ascertained,* and the former revenue

* The area falling under each class was known, and all that was required was to multiply the number of *bighas* in each class by the number of soil units in the class.

of the block divided by this figure. The quotient represented the incidence of revenue per soil unit under the former settlement and was known as the *unit incidence*.

The next stage in the proceedings was the determination of the new *unit rate*, the rate which was to be assessed on each soil unit during the current settlement.

The Settlement Officer first decided whether he would raise or lower the unit rate for the block as a whole, and took as his standard in assessing villages the unit rate he had fixed on for the block. This was the rate imposed on the average village, while villages above or below the average had the rate raised or lowered in proportion to the extent to which they seemed to differ from the mean. The general condition of the inhabitants, the prices they could obtain for their produce, and the facilities for trade which they enjoyed were the principal factors taken into consideration when determining the value to be assigned to the soil unit of the village.

Land in Kamrup was divided into no less than 48 Classes of land. different classes. Rice land was first divided into two main heads, good and poor. Each of these heads was further sub-divided into four groups, *i. e.*, *bardhantoli* or land ordinarily fit for the cultivation of *bar dhan*, *laghantoli* or land on which *lahi dhan* could be grown. *Kharmatoli* or land on which transplanted *ahu* or the inferior kinds of *lahi dhan* could be grown, and *ahutoli* or land unfit for transplanted rice of any kind, but fit for broadcast *ahu*. Each of these groups was again sub-divided into five minor heads, *sudharan* or average, *dongto-i* or land irrigated by artificial channels, *banotia* or land exposed to

flood, *olpara* or land which receives the drainage of the village site, and *dakshin chechukia* or shaded land. The area included in the last two classes was, however, very small, and after 1903-04 they were abandoned. In addition to these forty classes of rice land there were two more classes for land growing *bae*, one ordinary (*baotoli*), the other flooded (*ban-tiz baotoli*). Deeply flooded land (*jalatan*) from which a crop can only occasionally be expected formed another class, and there were four classes of homestead land (*ba-ti*). All land which was not included in any of the preceding classes was styled *faringati*. The following statement shows the number of soil units usually assigned to a *bigha* of each class of land in Kamrup:

		<i>Sadharan.</i>	<i>Dongtoli.</i>	<i>Banotia.</i>	<i>Olpara.</i>	<i>Dakshin chechukia.</i>		
1		2	3	4	5	6	7	
<i>Athaletiya</i> or <i>Munialia</i>	<i>Bardhantoli.</i>	20	23	12	25	13	<i>Baotoli</i>	... 9
	<i>Laghantoli.</i>	16	18	12	20	11	<i>Banotia Baotoli</i>	... 5
	<i>Kharmatoli.</i>	13	15	10	16	8	<i>Jalatan</i>	... 5
	<i>Ahutoli.</i>	9	...	7	11	6	<i>Faringati</i>	... 5
<i>Baliniria</i> or <i>Kachua</i>	<i>Bardhantoli.</i>	16	18	10	20	11	<i>Basti, 1st class</i>	... 24
	<i>Laghantoli.</i>	12	14	9	15	8	" 2nd "	... 20
	<i>Kharmatoli.</i>	8	10	6	10	6	" 3rd "	... 16
	<i>Ahutoli.</i>	7	...	5	9	5	" 4th "	... 10

The incidence of revenue on each soil unit differed in the different villages, but was generally about one anna.

At the time of writing (1905) the settlement is still in progress.

The following statement shows the gradual expansion of the land revenue and the settled area since the district first came under our administration:—

A. D.			Rs.	Acres.	Growth of land reve- nue.
1834-35	...	...	2,11,951	324,301	
1852-53	...	...	3,48,017	475,533	
1865-66	...	...	4,25,163	472,510	
1868-69	...	...	7,97,267	not available.	
1892-93	...	...	9,79,347	695,887	
1893-94	...	...	13,33,314	688,029	
1902-03	...	...	12,33,082	647,651	

The figures for years in which a new settlement was introduced are printed in italics.

The system of cultivation in the district falls into two main heads, established and fluctuating. In the established area the staple crop is *sali* or transplanted paddy land is not readily resigned, and frequently possesses a considerable market value. In the fluctuating tracts the staple crops are mustard, pulse, and summer rice *ahu*, and continual change is one of the essential elements of cultivation, the same field being seldom cropped for more than three years in succession. Most of the fluctuating area lies in a belt on either side of the Brahmaputra. In 1903-04, only 9 per cent of the settled area of the *sadr* subdivision was classed as fluctuating, but in the Barpeta subdivision the proportion was no less than 50 per cent.

The bulk of the land on which the staple crops of the district are grown is held direct from Government by the actual cultivators of the soil on annual or periodic lease.

The periodic lease confers a right of re-settlement and a heritable and transferable title. Annual leases merely authorise the occupation of the land for a single year, though in practice the rights of transfer, inheritance, and re-settlement are recognised. The only drawback of the annual lease lies in the fact that if the land happens to be required by Government, it can be resumed without payment of compensation to the occupant. Land held under either form of lease, or any individual field within the holding, can be resigned, on formal notice of the fact being given to the Deputy Commissioner.

The mandal.

The basis of the land revenue system is the mandal, the village accountant and surveyor, who draws a modest stipend ranging from Rs. 8 to Rs. 12 per mensem. In March he proceeds to his circle, inspects the fields which have been formally resigned to see whether they have been actually relinquished, tests the boundaries of fields taken up in recent years to see whether they are in accordance with the map, and surveys land which has been broken up for what is called the regular settlement or for which a formal application has been filed. His two principal registers are the *dagchitha*, in which particulars are entered for each field within the village, and the *jama-bandhi* or rent-roll, which classifies the fields by holdings, and shows the area covered by each lease. During the hot weather he is occupied with the revision of his maps and registers, and the preparation of his leases. When the winter comes, he again proceeds to the field, distributes the leases he has prepared, and surveys the land which

has been broken up since his former tour, and which is included in what is known as the *dariabadi* or supplementary settlement. He is also required to prepare statistics of the area under different crops ; he assists in the collection of the revenue and is often ordered to report on local disputes connected with the land. In most provinces in India a settlement is concluded for a term of years. During its currency no land which is held on lease can be resigned, and there is not as a rule any appreciable quantity of waste land to be taken up. The state of affairs in Kamrup is very different. In 1902-03, the total settled area was 648,000 acres, the area excluded was 32,000 acres and the area of land newly taken up 52,000 acres. It must not, however, be supposed that this kaleidoscopic shifting of the fields is taking place in every portion of the district, and that everywhere may be seen the spectacle of cultivated land becoming jungle and jungle land changing into fields of waving rice. In the established portion land is seldom given up, but in the fluctuating area, as has been already explained, it is less trouble to burn the jungle and break up new land every second or third year, than to clean the fields of the weeds which spring up after the land has been two or three times cropped.

Above the mandal comes the supervisor kanungo, a superior peripatetic officer on pay ranging from Rs. 30 to Rs. 40, ^{a superior settlement staff.} who checks his work both in the field and in the office. The superior revenue officers are called sub-deputy collectors and draw salaries ranging from Rs.100 to Rs.200 per

mensem. The appointments are usually made by selection from candidates who must be of good physique and moral character, of respectable family, under 25 years of age, and must have either taken a university degree or have read up to that standard.

The total sanctioned staff for the Kamrup district is 3 sub-deputy collectors, excluding those employed as tahsildars, 14 supervisor kanungoes, and 296 mandals.*

Land.

The different tenures in the district fall under two main classes—(1) those under which land is held for the cultivation of ordinary crops, and (2) those under which grants have been made for the growth of tea or other crops, which are not included amongst the ordinary staples of the Province, and which require a considerable amount of capital for their production. The bulk of the land included in the first class is settled under the ordinary rules at full rates, but there are also considerable areas of revenue free (*lakhiraj*) land, and land settled at half rates (*nisfi khiraj*). In the time of the Ahom kings the whole of this land is said to have been held rent free, but in 1834 the Government of India ruled that "all rights to hold lands free of assessment founded on grants made by any former Government must be considered to have been cancelled by the British conquest. All claims therefore for restoration to such tenures can rest only on the indulgence of Government

* The sanctioned staff will probably be modified on the re-introduction of the *mauzadari* system.

without any right".* Mr. David Scott, the first British Commissioner of Assam, found that, even under the Ahom Rajas, these revenue free lands had been assessed at the rate of five annas a *pura*,† and he imposed this cess, which was subsequently raised to eight annas, upon them. The Government of India then directed that an enquiry should be instituted into these claims and that all cases in which land was held on *bonâ fide* grants dating from before the time of the Burmese conquest, or on account of services which were still performed, should be reported to them for orders. These instructions were not fully observed by the Commissioner of that time, Captain (subsequently General) Jenkins. This officer, for reasons which have never been ascertained, drew a broad distinction between *debottar* or temple lands, and *brahmottar* and *dharmaottar* lands, *i. e.*, lands which were devoted to some religious purpose but were not actually the property of a temple.‡ The former he released from all claims for revenue; on the latter he imposed the rate assessed by Mr. Scott, which happened to be half the full rates prevailing at

* Letter No. 790, dated 25th August 1834, from the Government of Bengal to the Commissioner of Assam. The history of these estates is discussed at length in the Introduction to the Assam Land Revenue Manual by Sir William Ward, K.C.S.I., page xci.

† A *pura* = 4 bighas. 3.025 bighas = 1 acre.

‡ *Debottar* estates are again of two kinds, *bhogdoni* and *paikan*. The raiyats on the former are bound to supply one daily ration, *bhog*, to the temple for each unit of land. The raiyats on the latter are required to render certain somewhat vague kinds of service. *Bhogdoni* land was generally confirmed, possibly, as the Settlement Officer observes, because claims to *bhog* were easier to determine than somewhat vague and uncertain claims to service.

the time. No report was submitted to the Government of India and no final orders were ever received from them, but the right of the former class of proprietors to hold free of revenue, and of the latter at half the usual rates, has been definitely recognised. The total area of *lakhiraj* land in the district in 1903 was 33,908 acres and of *nisfi khiraj* land 1,47,769 acres. The area settled year by year at full rates is shown in Table XV.

Grant of land
for the culti-
vation of spe-
cial crops.

Two sets of rules were in force for the grant of land for tea prior to 1861. The underlying principle in each case was that the land should be held on long leases at low but progressive rates of revenue, and that precautions should be taken against land speculation by the imposition of clearance conditions. Between 1861 and 1876 the fee simple tenure of waste land grants was put up to auction at an upset price of Rs. 2-8-0 an acre, which in 1874 was raised to Rs. 8. The holders of grants under the earlier rules of 1838 and 1854 were allowed to purchase a fee simple tenure by payment of twenty times the revenue then due, provided that the clearance conditions had been carried out. Advantage was very generally taken of this concession, and there are now only 31 acres of land in the district held under the rules of 1838, and only 457 acres under the rules of 1854, while there are 4,456 acres held on fee simple tenure. The existing rules came into force in 1876. The land is sold at an upset price of Re. 1 per acre, for, though it is nominally put up to auction, there is no case on record in which more than one applicant appeared to bid. For

two years the grant remains revenue free, and the rates gradually rise to 8 annas an acre in the eleventh, and one rupee in the twenty-first year. The lease runs for 30 years, and when it expires the land is liable to re-assessment. The total area settled under these rules will be found in Table XV.

The first settlement was introduced by Captain Bogle in 1833-34.* He divided the district into 76 parganas, each of which was placed under a Chaudri, who was assisted by *patwaris*, *takureahs*, *kakatis* and peons. The cost of collection was heavy, and amounted to 18 per cent of the revenue demand. At the time of Mr. Mills' visit, in 1853, the cost of collection had risen to 20½ per cent, and the fiscal staff consisted of 151 Chaudris, who had under them 89 *patwaris*, 495 *takureahs*, 497 *kakatis* and 993 peons. Settlements were made with the Chaudris either annually or for a term of years. The latter arrangement was not popular, and in 1853, out of 311 mahals, 216 were held on annual lease. As, however, the raiyat was allowed to break up any quantity of land rent free on his agreeing to pay the rent of his entire holding during the whole time of the Chaudri's lease of the parganas, it would appear that the Chaudri had something to lose but very little to gain from a lease for a term of years.†

Collection of
land
revenue.

The general tendency since that date has been to increase the size of the unit of collection. In 1867, the

Larger mau-
zas and tah-
sils.

* Captain Bogle's report will be found at page 65 of File No. 298, Bengal, of 1835.

† *Vide* Mr. Mills' report on Kamrup.

mauzadars, as the collecting officers were called, received 15 per cent of the revenue as commission, and were allowed half the revenue of land reclaimed during the currency of the settlement. Three years later their commission was reduced to 10 per cent, and in 1872 the further restriction was imposed that this 10 per cent could only be drawn on the first Rs. 6,000 of revenue, 5 per cent being allowed on revenue in excess of that sum. In 1883, the idea gained ground that Government would do better by putting the mauzadar aside and employing salaried officials as a collecting agency. Mauzas were accordingly amalgamated, and placed in charge of an official called a tahsildar, who was remunerated by a fixed salary and was exempted from the responsibility imposed upon the mauzadar of paying in the revenue on the due dates, irrespective of the amounts actually collected by him. The first tahsil was opened at Palasbari in April 1883, and two more were established in the same year at Boko and Chaygaon. Then followed Patidarang in 1884, Gauhati and Rangia in 1885, Bajali in the Barpeta subdivision in 1886, Tamulpur and Hajo in 1887, Barama and Nalbari in 1888, and Raha in the Barpeta subdivision in 1891.

**Comparative
advantages
of tahsildars
and mauza-
dars.**

The tahsildari system is cheaper than that of collection through mauzadars, the cost in one case being about 5 per cent, in the other about 7 per cent of the gross amount realised. Serious difficulties are, however, experienced in dealing direct with such a large body of raiyats, and there is no doubt that the tahsil system is

not as popular with the people as the one which it replaced. A mauzadar of experience knows whether delay in payment is due to shortness of funds or to recalcitrancy; he knows the time which is most convenient for payment in individual cases; and, as he is not bound by the *kist* dates, his collection admits of an elasticity which no Government rules can establish. It has the further advantage of providing a body of representative men, who, while regarded by the people as their leaders, are bound to the Government by the facts of their position. It has accordingly been decided to try the experiment of gradually breaking up the tahsils and substituting in their place mauzadars who will be entrusted with the duty of collecting from Rs. 20,000 to Rs. 30,000 of revenue. This policy has already been adopted in the case of the Raha and Boko tahsils, which were resolved into their constituent mauzas in 1903, while the Tamulpur tahsil was abolished in 1904. The revenue demand on account of the regular settlement is due in two instalments, three-fifths on January 15th and two-fifths on the 15th February, except in those villages which meet the Government demand from the sale of mustard and pulse, where it is due in one instalment on March 15th. The demand on account of the supplementary settlement is also due in one instalment on that date. If a raiyat defaults a notice of demand is issued calling upon him to pay up the amount due.* This has usually the desired result, but if further steps are called

* Steps have recently been taken to empower Deputy Commissioners to dispense with the notice of demand and proceed at once to attachment if they think it necessary to do so.

for the defaulter's property is attached. It is very seldom necessary to do more than this, but, as a last resort, the goods and even the lands of the defaulter can be sold. In 1903-04, notice of demand was issued on account of 17 per cent of the total land revenue demand, and property was attached on account of 5 per cent. The number of cases in which it was necessary to have recourse to sale was very small, and the revenue on account of which property was sold only represented 0.1 per cent of the total demand.

Revenue realized in 1830 by release of slaves.

At the present day it seems strange to read that in 1830 orders were issued by the Government of India that if a defaulter possessed no other property, his revenue might be realized by releasing a certain proportion of his slaves, each slave being reckoned as equivalent to from Rs. 50 to Rs. 100. It is, however, clear that the slavery must have been of a very mild and patriarchal character, as the local authorities were warned to satisfy themselves that the emancipated slaves would not nullify the beneficent intentions of Government by placing themselves again in the position of bondsmen to their former masters.

Town land.

In 1893, the town of Gauhati was re-settled for a term of fifteen years. The rate of assessment for trade sites varied from Rs. 300 to Rs. 30 an acre, and that for residential land from Rs. 9 to Rs. 6. Under the rules now in force waste land taken up for the first time within town limits is to be settled ordinarily for a term of thirty years, at a fair rent not exceeding the annual

letting value of the site, and the lease of the land applied for may, if the Deputy Commissioner thinks fit, be put up to auction and knocked down to the highest bidder. These rules do not, however, apply to Barpeta, which is treated like any other village. The greater part of the town is, however, included in a *nisfikkhiraj* grant held by the Barpeta *sattrā*.

In 1903-04, no less than 52 per cent of the total area of the district was classified as unsettled and culturable waste. The expression "culturable" must, however, be received with a certain degree of reserve, and a large proportion of this area is probably unfit for permanent habitation or continuous cultivation. The bulk of this waste land is situated in the Barpeta subdivision, in the Tamulpur tahsil, and in the Boko and Gauhati tahsils, south of the Brahmaputra, which contain large areas of hill and swamp. The total area of each fiscal unit and the area which was waste in 1902-03 will be found in Table XV A.

The excise revenue of Kamrup is not very large, and from Table XIII it will be seen that in 1903-04 it only amounted to Rs. 2,33,000, which was less than a third of the revenue realised under this head in Lakhimpur. About three-fourths of the excise revenue is derived from opium. Full details with regard to the number of shops for the sale of liquor and the different kinds of drugs, and the revenue obtained, will be found in Table XVI.

Prior to 1860 no restriction was placed upon the cultivation of the poppy. The evil effects of unrestrained

indulgence in opium were undeniable, and in that year poppy cultivation was prohibited, and the drug was issued from the treasury, the price charged being Rs. 14 a seer. This was raised to Rs. 20 in 1862, Rs. 22 in 1863, Rs. 23 in 1873, Rs. 24 in 1875, Rs. 26 in 1879, Rs. 32 in 1883, and Rs. 37 in 1890, the price at which it now stands. While Assam was under the Bengal Government licenses for the retail vend of opium were issued free of charge. In 1874, a fee of Rs. 12 per annum was levied on each shop, and in the following year it was raised to Rs. 18. Between 1877 and 1883 the right to sell opium in a particular mahal was put up to auction, but this system was found to be unsatisfactory, and in the latter year the individual shops were sold, as is done at the present day. The general result of the Government policy has been to enormously reduce the facilities for obtaining the drug. In 1873-74, there were in Kamrup 845 shops for the retail vend of opium; thirty years later there were only 112. The opium habit was never as prevalent in Lower as in Upper Assam, and in Kamrup it appears to be gradually dying out. In 1873-74, 290 maunds of opium were consumed, in 1899-1900 only 121. Ganja and cigarettes are said to be taking its place to some extent, and it is evidently not popular with the rising generation.

The drug is generally swallowed in the form of pills, or mixed with water and drunk. Madak is made by mixing boiled opium with pieces of dried pan leaf and stirring it over the fire. The compound is then rolled up

into pills and smoked. Chandu is made out of opium boiled with water till the water has all evaporated, and is smoked like madak in the form of pills. Opium is not generally smoked in Assam, and this form of taking the drug is usually supposed to be more injurious than when it is simply swallowed.

The outstill system of excise is in force in Kamrup, ^{Country} that is to say, the right to manufacture and sell liquor ^{spirit.} at a given spot is every year put up to auction.

From the statement in the margin it will be seen that though there has been a large decrease in the number of shops since 1880 there has been a considerable expansion of the revenue.

Year.	No. of shops.	Revenue.
		Rs.
1873-74	10	3,473
1879-80	27	5,870
1889-90	11	6,364
1899-1900	12	14,320

This is due to the increase in the number of foreigners and to greater competition at the auction sales. The natives of Assam, who form the bulk of the population of Kamrup, drink, when they drink at all, home made beer or spirit, for though the unlicensed distillation of spirit is illegal, the process is so simple that it is not easy to detect and punish the evasion of the law. The result is that the revenue from country spirit in Kamrup is very low, and in 1899-1900 was only a tenth of that obtained in Sibsagar, though the total population of the two districts was about the same. The explanation is to be found in the fact that in Sibsagar the number of foreigners is ten times as numerous as in Kamrup.

The still.

Country spirit is manufactured by native methods, and generally in what is known as the open still. The apparatus employed consists of a large brass or copper retort which is placed over the fire, to the top of which is fitted the still head, a compound vessel, part of which is made of earthenware and part of brass. The wash is placed in the retort, and, as it boils, rises in the form of vapour into the still head, over the outer surface of which a stream of cold water is continually kept flowing. As the vapour cools, it is precipitated in the form of liquid, and is carried off by a bamboo tube into a vessel placed at the side. The mouth of this tube is open, and the spirit trickles from it into the vessel beneath, so that the outer air has access by this channel into the still head and retort in which the process of distillation is going on. In the closed still, the vapour passes down two tubes into two receivers, where it is cooled and condenses into liquid. These tubes are so fixed to the receivers that the air cannot have access to the spirit, and, though distillation does not proceed so rapidly, the liquor produced is stronger than that obtained from the open still.

Material employed.

The material employed is generally the flower of the mohwa tree (*bassia latifolia*), which contains a very large proportion of sugar, but its place is sometimes taken by molasses and rice. The following are the proportions in which these ingredients are generally mixed—mohwa 30 seers and water 60 seers, or mohwa 25 seers, molasses 5 seers, and water 60 seers, or boiled rice 20 seers, molasses 10 seers, and water 80 seers. *Bakhar*, a substance composed of leaves, roots and spices, whose actual

ingredients are not divulged by the villagers who manufacture it, is occasionally added to the wash, which is put to ferment in barrels. Fermentation takes three or four days in summer and a week in the cold weather, and the wash is then considered to be ready for the still.

The process of distillation takes about three hours. A retort of 40 gallons yields two gallons of spirit in an hour and three quarters, three gallons in two hours and a quarter, and four gallons in three hours. The best and strongest spirit comes off first, and in the case of a brew of 30 seers of mohwa the first $3\frac{1}{2}$ gallons will be classed as *phul*, if they are at once drawn off from the receiver. If they are allowed to remain while two more gallons are distilled, the whole $5\frac{1}{2}$ gallons will be classed as *bangla*. The exact proportions vary, however, at the different shops, some distillers taking $4\frac{1}{4}$ gallons of *phul* or $5\frac{1}{4}$ gallons of *bangla* from 30 seers of mohwa. Occasionally only two gallons of spirit are distilled from 30 seers of mohwa, and the liquor is then called *thul*, is very strong, and is sold for one or two rupees a quart. *Thul* is also sometimes made by re-distilling *bangla*. Only one kind of liquor is generally taken from each distillation, as, if the *thul* or *phul* were removed, the spirit subsequently distilled would be not only weak but impure. Strong liquor watered to reduce it to a lower strength is not considered palatable, and it seems to be the usual practice to distil the liquor at the actual strength at which it will be sold. One disadvantage of the cheaper kind of liquor is that it will not keep, and in four or five weeks it is said to lose all its spirituous qualities.

Laopani.

Laopani, or rice beer, is the national drink of the unconverted tribes, and a special name, *modahi*, is applied to those who have to some extent attained to Hinduism but have not yet abandoned their ancestral liquor. It is also taken by some of the humble Hindu castes, and is largely used by garden coolies if facilities are not afforded to them for obtaining country spirit. The following is the usual system of manufacture followed. The rice is boiled and spread on a mat, and *bakhar* is powdered and sprinkled over it. After about twelve hours it is transferred to an earthen jar, the mouth of which is closed, and left to ferment for three or four days. Water is then added and allowed to stand for a few hours, and the beer is at last considered to be ready. The usual proportions are 5 seers of rice and 3 chattaks of *bakhar* to half a *kulsi* of water, and the liquor produced is said to be much stronger than most European beers. Liquor is often illicitly distilled from *laopani* or boiled rice, by the following simple method. An earthen pot with a hole in the bottom is placed on the top of the vessel containing the *laopani* or rice and the whole is set on the fire. The mouth of the upper pot is closed by a cone-shaped vessel filled with cold water, and a saucer is placed at the bottom of the pot over the hole. The vapour rises into the upper of the two jars, condenses against the cold cone, with which the mouth is closed, and falls in the form of spirit on to the saucer beneath. Care must of course be taken to see that the various cracks are closed against the passage of the spirituous vapour, but this can easily be done with strips of cloth. No attempt is made to restrict the manufacture

of rice beer in moderate quantities for home use, as any attempt to do so would certainly lead to corruption and oppression. In a matter of this kind the influence of the Hindu gosains, and the pressure of local village opinion, has more effect than any direct action of the Government.

Ganja is usually mixed with water, kneaded till it becomes soft, cut into small strips and smoked. Wild ganja grows very freely in Kamrup, but it is doubtful whether it is much used except as a medicine for cattle. It does not produce such strong effects as the ganja of Rajshahi, but the leaves are sometimes dried and mixed with milk, water, and sugar to form a beverage.

The revenue raised from income tax in Kamrup is lower than that obtained from any other district in the Province except Nowgong, and in 1903-04 only amounted to Rs. 11,600. The receipts, moreover, show no tendency to increase. As far back as 1888 they amounted to Rs. 15,500, and the maximum was reached in 1893-94 with Rs. 17,200. The marked decrease that occurred in 1904 was due to the exemption of incomes between Rs. 500 and Rs. 1,000 from taxation. The condition of the people has, however, been far from satisfactory. Public health was for a time extraordinarily bad; agriculture was seriously affected by the earthquake of 1897 and the subsequent floods, and during the last years of the century the taxable income must have been appreciably diminished. The great majority of the assesseses under Part IV (Other sources of income) were shopkeepers, persons engaged in the mustard trade, boat-

builders, and professional graziers. Several of the most prosperous Marwari merchants are assessed in Calcutta on the profits made by them in Assam.

Stamps.

The receipts under the head of judicial stamps in 1903-04 amounted to Rs. 51,078. Kamrup stood second in the list of districts in the Assam Valley, but the revenue obtained was barely one-eighth of that realised in Sylhet. Non-judicial stamps brought in Rs. 16,369, a sum which was exceeded by Sibsagar and largely exceeded by Lakhimpur.

Public works.

Public works are in charge of the Executive Engineer who is stationed at Shillong and is entrusted with the construction and maintenance of all the larger public buildings. The most important are the jail, the public offices, schools and telegraph offices at district headquarters, circuit houses, dâk bungalows, and inspection bungalows on provincial roads. Inspection bungalows on other roads are maintained by the Local Boards. The roads which are directly under the Department are the south trunk road (80 miles), the north trunk road from Raha to Dumunichauki (72 miles), and the road from Barpeta to Kholabanda (18 miles).

It has already been explained that Local Board works that require professional skill or engineering knowledge are usually made over to the Executive Engineer for execution.

Government.

For general administrative purposes the district is divided into two subdivisions. Gauhati is under the immediate charge of the Deputy Commissioner; Bar-

peta is entrusted to an assistant magistrate, who is usually a native of the country. The Deputy Commissioner is allowed three subordinate magistrates and two sub-deputy-collectors as his immediate assistants and a second magistrate and a sub-deputy-collector are usually posted at Barpeta. The unit of police administration is the thana, of which there are 16 in the district, and of revenue administration the mauza or the tahsil.

Appeals lie to the Deputy Commissioner from orders Criminal and Civil Justice. passed by magistrates of the second or third class, and from the orders of first class magistrates to the Judge of the Assam Valley. Appeals from the Judge lie to the High Court of Fort William in Calcutta. In 1902, there were seven stipendiary and two honorary magistrates in the district, and the former decided 1,520 and the later 17 original criminal cases. In the course of these proceedings 3,884 witnesses were examined. Altogether there were 1,334 cases under the Indian Penal Code returned as true, the immense majority of which were either offences against property or against the human body. There is little serious crime in Kamrup, and most of these offences were either petty assaults or thefts of small sums of money. Civil work is not heavy, and the Deputy Commissioner acts as sub-judge, while one of the assistant magistrates in each subdivision discharges the functions of a munsif. In 1902, the sub-judge heard 12 original cases and 25 appeals, while 1,630 original suits were disposed of by the munsifs. A large proportion of the cases were simple money suits, nearly four-fifths of which were disposed of without contest.

Registration. The Deputy Commissioner is also the registrar of the district, and one of the assistant magistrates in each division acts as sub-registrar. Only 817 documents were registered in 1903.

**Volunteer-
ing.** A Volunteer Corps was formed at Gauhati in 1885, with 39 members on the rolls, but was disbanded in 1891 as it was found impossible to keep it up to strength. A new company was formed in 1894, and was, at first, amalgamated with the Shillong Volunteer Rifles, but, in 1901, it was united with the Assam-Bengal Railway Volunteer Corps.

Police. The civil police are in charge of a District or Assistant Superintendent of Police. The sanctioned strength consisted in 1904 of two inspectors, 24 sub-inspectors, and 310 constables. One hundred and forty-four smooth-bore martinis are allotted to Kamrup, and a reserve of men is kept up at the district and subdivisional headquarters who are armed with these weapons and are employed on guard and escort duty. Up-country men, Nepalese, and members of the aboriginal tribes are usually deputed to this work, though attempts are made to put all the constables through an annual course of musketry.

The district is fairly free from serious crime and rural police are not employed; such assistance as is necessary being given by the village elders or *gaoburas*. In addition to their regular duties in connection with the prevention and detection of crime, the police are required to check the returns of vital statistics, manage pounds, enquire into cases in which death has not been due to natural causes, to furnish guards and escorts, and to serve

all processes in warrant cases. There is very little organised crime, and the actual police duties are comparatively light. Table XIX shows the strength and cost of the police in 1881, 1891, and 1901; Table XX the names of the different police stations and out posts, and the force quartered at each.

During the cold weather, the frontier is protected by detachments from the Garo Hills military police battalion. **Military Police.** Thirty men, under a native officer, are stationed at Suban-khata, and ten men under a non-commissioned officer at Darranga, a little to the east. At the end of March these outposts are withdrawn as the Bhutias then begin to retire to the hills.

There is a large jail at Gauhati, which has accommoda- **Jail.**

tion for 297 prisoners. The sleeping wards are raised some distance from the ground on masonry pillars, and are thus well ventilated and dry, and every care is taken of the prisoner's health. In spite of this the mortality is generally high. From the statement in the margin it appears that in the twenty years ending with 1900 the annual death-rate on no less than eight occasions exceeded 70 per mille.

Years in which the number of deaths was less than ten are excluded from the statement. In the three years in which the mortality was highest the prisoners were attacked by cholera, and bowel complaints are at all times troublesome. Very few prisoners are now employed on

extra-mural labour as this form of work was found to be incompatible with a satisfactory standard of discipline. The prison manufactures include oil pressing, cane and bamboo work, weaving of durries, cloth and net bags, dhan husking, and brick making. At Barpeta there is a Magistrate's lock-up. Prisoners on conviction are transferred to Gauhati.

Education.

In 1841, Mr. Robinson of the Gauhati College described the state of education in the Assam Valley as being "deplorable in the extreme."* He pointed out that, unlike the Province of Bengal, where every village had its teacher supported by general contribution, provincial schools had only recently been introduced in Assam. In 1847-48 there were 24 primary schools in the district. The next few years witnessed very little progress, as on the occasion of Mr. Mills' visit in 1853 there were only 26 schools of all grades. 1874-75 is the first year for which complete statistics are available, and the following abstract shows the progress of education since that year. Figures for years subsequent to 1900-01 will be found in Table XXII.

Year.	No. of secondary schools.	Pupils.	No. of primary schools.	Pupils.	Total No. of pupils.	No. of persons in district to each pupil.	Percentage under instruction to those of school-going age.	
							Males.	Females

* A descriptive account of Assam, page 277.

Kamrup is the only district in the Assam Valley in which there is a college. In 1901, a Government second grade college was opened at Gauhati. The buildings have been designed on liberal lines, and it is equipped with an excellent library and laboratory, and with separate hostels for Hindus and Muhammadans. **College.**

High schools are those institutions which are recognised by the Calcutta University as capable of affording suitable preparation for the Entrance Examination. The boys are taught from the earliest stage of their education up to the Entrance course as prescribed by the University of Calcutta, but many leave school without completing the course. Till recently English was taught in all the classes. The boys in the lowest class no longer learn that language, but the standard of instruction is higher than that prevailing in lower secondary (middle) schools. English is the medium of instruction in the first four classes of high schools ; in the lower classes and in other schools the vernacular is employed. There are three high schools in the district, two at Gauhati, one maintained by Government and one a private institution, and one at Barpeta. **Secondary Education.**

The course of instruction at middle English and middle vernacular schools is the same, with the exception that English is taught in the former and not in the latter. The following are the subjects taught in the middle vernacular course :—(1) Bengali or Assamese, comprising Literature, Grammar, and Composition, (2) History of India, (3) Geography, (4) Arithmetic, (5) Elements of

Euclid (Book 1), Mensuration of plane surfaces and surveying, (6) Botany and Agriculture.

The middle schools are situated at Kahara, North Gauhati, Gauhati, Palasbari, Chaygaon, Nalbari, Kamalpur, Tamulpur, Chakchaka, Bajali, and Chenga. There is a survey school at Gauhati, and law classes are regularly held.

**Primary
education.**

Primary education is again divided into upper and lower, but the proportion of boys in upper primary schools is less than 4 per cent of the total, and this class of school, like the middle vernacular, is slowly dying out. The course of study in lower primary schools includes Reading, Writing, Dictation, Simple Arithmetic, and the Geography of Assam. In upper primary schools the course is somewhat more advanced and includes part of the first book of Euclid, Mensuration, and a little History. The standard of instruction given still leaves much to be desired, but efforts have been recently made to improve it, by raising the rates of pay given to the masters. Fixed pay is now awarded at average rates of Rs. 8 per mensem for certificated and Rs. 5 per mensem for uncertificated teachers, supplemented by capitation grants at rates ranging from 3 annas to 6 annas for pupils in the three highest classes. The number of schools of each grade, and the number of pupils reading in them, will be found in Table XXII. Sixty-eight per mille of the male population of Kamrup were returned as literate in 1901, a proportion which was higher than that recorded in

any other district in the Assam Valley. The proportion of literate females was only two per mile.

In 1903-04, there were three presses, in Gauhati. A weekly paper and monthly magazine are occasionally published.

**Printing
Presses.**

The district is in the medical charge of the Civil Surgeon who is stationed at Gauhati. It contains seven dispensaries, and the supervision of the work done at these institutions is one of the most important of his duties. He also acts as Superintendent of the jail, controls and inspects the vaccination department, and is required to visit and report on all tea gardens on which the death-rate for the previous year has exceeded 7 per cent.

**Medical
Staff.**

It has already been suggested in the chapter on population that there may be something in the climate, the sub-soil level of the water, or some other factor which for the present remains obscure, which is prejudicial to life and health, but there can be no doubt that the conditions under which the people pass their days are not conducive to a long mean duration of life. Their houses are small, dark, and ill ventilated, and the rooms in summer must be exceedingly close and oppressive. They are built upon low mud plinths, and are in consequence extremely damp, and the inmates, instead of sleeping on beds or bamboo platforms, which would cost them nothing to provide, often pass the night on a mat on the cold floor. Their attire, which is suitable enough for the warm weather, offers but a poor resistance to the cold and fogs of winter, and many lives are annually lost from chills, which might have been prevented by the

**Complete
absence of
rural sanitation.**

purchase of a cheap woollen jersey. The houses are buried in groves of fruit trees and bamboos, which afford indeed a pleasant shade, but act as an effective barrier to the circulation of the air, and increase the humidity of the already over-humid atmosphere. Sanitary arrangements there are none, the rubbish is swept up into a corner and allowed to rot with masses of decaying vegetation, and the complete absence of latrines renders the neighbourhood of the village a most unsavoury place. The water supply is generally bad, and is drawn either from shallow holes, from rivers, or from tanks in which the villagers wash their clothes and persons. All of these are undoubtedly factors which contribute to produce a high mortality, and nearly every one of them could be eliminated.

Vital Statistics.

Vital statistics are reported by the *gaobura* or village headman to the mandal of the circle, this report being in theory submitted every second week. In practice they were received at much longer intervals, as the *gaobura* was an unpaid servant of Government and not very amenable to discipline. It has recently been decided to allot to each headman $2\frac{3}{4}$ acres of land revenue free, and it will now be possible to enforce a stricter adherence to the rules. Between 1891 and 1901, the mean recorded birth-rate was 27 per mille, the death-rate was 32 per mille, and it is certain that both of these figures were much below the truth. The statistics of age recorded at the census are, however, so unreliable that it is not possible to fix a normal birth and death-rate for the district.

Fever and bowel complaints are the forms which death			most often takes in Kamrup, at any rate according to the official returns. These returns are, however, so inaccurate, and so little reliance can be placed on the diagnosis of the reporting agency, that the figures hardly repay examina-	Causes of mortality. Cholera.

1900	...	7.4		
Death-rate all causes England.				
1901	...	16.9		

tion. Most fatal illnesses are accompanied by a rise in temperature, and the villagers are in consequence very prone to ascribe every death to fever. Epidemics of cholera from time to time produce a high mortality, for though it is apparently endemic in the district, it occasionally breaks out with quite exceptional violence. The abstract in the margin shows the recorded death-rate from this cause in the years when cholera was most prevalent, and for the purposes of comparison the death-rate in England from all causes in 1901 is added. In 1897, the recorded death-rate from this disease alone exceeded the death-rate from all causes in England in 1901.

The disease appears in every part of the district, but is especially common near Palasbari and Rani. The bacillus thrives in the muddy banks of tanks and rivers when they are warmed by the sun and moistened by the rains of April and May, and cholera is thus most prevalent in the spring before the floods rise, and in the autumn when the water level is falling. When the disease appears in an aggravated form hospital assistants are sent with medicine amongst the people, but it is difficult to do much for their relief.

**Small-pox
and fevers.**

Small-pox is especially common amongst the Mahapurushias, who are opposed to vaccination on religious grounds. Barpeta town is the great stronghold of these people, and in 1895 the mortality in that place from small-pox alone was no less than 36 per mille. Soalkuchi and Barduar are also often visited by this disease. The highest death-rates per mille recorded from this cause during recent years were 1·1 in 1895, 2·9 in 1896 and 2·1 in 1897. Fevers are generally of a mixed type and do not differ materially from the malarial fevers of other parts of India. They are most prevalent in May and June and again in October and November, when they are particularly severe, and sink to a minimum in February. The Civil Surgeon has never seen any cases of fever associated with hæmoglobinuria, which is generally known as black water fever, though according to Manson it is found in Assam. Cases of enteric fever have occurred in Gauhati.

**Other
diseases.**

Diphtheria does not usually occur in a virulent form, and neither dysentery nor tuberculosis are common amongst the Assamese. Cases of goitre are frequently found in the neighbourhood of Gauhati, and tetanus and anthrax are met with in every part of the district. Human beings suffer from the latter disease, but it does not as a rule have a fatal termination. The villagers as a whole are fairly free from venereal disease in all its forms. Skin diseases and worms are ailments which are constantly brought for treatment to the dispensaries. The commonest form of worm is the round worm (*ascaris*), and after

that the thread worm (*oxyaris*). Tape worm is not common, and the guinea worm is practically unknown.

The native methods of midwifery leave much to be desired, and it is feared that the mortality in childbirth from puerperal fever and other causes is considerable.

The most deadly lethal agent in the district has, however, been the mysterious form of fever known as *kala-azar*. The following account of this disease is extracted from the Report on the Census of Assam in 1901 :—

“ When first referred to in the Sanitary Reports of the Province it is described as an intense form of malarial poisoning, which was popularly supposed to be contagious. The Civil Surgeon of Goalpara rejected the theory of contagion, and in 1884 expressed the opinion that *kala-azar* was simply a local name for malarial fever and its consequences. In 1889-90 a specialist (Surgeon-Captain Giles) was appointed to investigate both *kala-azar* and the so-called beri-beri of coolies, and he rapidly came to the conclusion that *kala-azar* and beri-beri were merely different names for anchylostomiasis, and that the mortality was due to the ravages of the *dochmius duodenalis*, a worm which lives in the small intestine. This theory corresponded with the observed facts to the extent that it admitted, what at that stage of the enquiry could hardly be denied, that *kala-azar* was communicable, the uncleanly habits of the natives of the Province affording every facility for the transfer of the ova of the parasite from the sick to the healthy. But the support which was given to Dr. Giles' views by local medical opinion was withdrawn, when Major Dobson proved by a series of experiments that anchylostoma were present, in varying numbers, in no less than 620 out of 797 healthy persons examined by him. In 1896, Captain Rogers was placed on special duty to make further investigations, and, in addition to demonstrating various differences of a more or less technical character in the symptomatology of the two diseases, he pointed out that whereas *kala-azar* was extremely inimical to life, the number of cases of anchylostomiasis that terminated fatally was by no means large. The conclusion to which this specialist came, after a very careful enquiry, was that the original view was correct, and that *kala-azar* was nothing but a very intense form of malarial fever, which

could be communicated from the sick to the healthy. This opinion was to a great extent endorsed by the profession in Assam, successive Principal Medical Officers declaring that, whatever *kala-azar* was, it had been abundantly proved that it was not ancylostomiasis. The suggestion that malaria could be communicated did not, however, commend itself to the entire medical world, and was criticised with some severity, Dr. Giles writing as recently as 1898 'Dr. Rogers, like a medical Alexander, cuts his Gordian knot by announcing that Assamese malaria is infectious. In this he places himself at variance with not only the scientific but the popular opinion of the entire world.'

A complete change in popular and scientific opinion was, however, brought about by the development of Manson's mosquito theory, and Major Ross, who visited Assam, in the course of his enquiry into the manner in which infection by malaria takes place, confirmed Rogers' conclusions, and in 1899 placed on record his opinion that, as stated by Rogers, *kala-azar* was malarial fever. Externally the chief point of difference between *kala-azar* and ordinary malarial fever lies in the rapidity with which the former produces a condition of severe cachexia, and the ease with which it can be communicated from the sick to the healthy. Recent investigations have, however, thrown some doubt on the malarial theory. Certain parasites called Leishman-Donovan bodies have been discovered in the spleens of fever patients, and it is thought possible that they may be the cause of the complaint. The origin of the disease is obviously a matter which must always be open to doubt. Captain Rogers is of opinion that *kala-azar* was imported from Rangpur, where malarial fever was extraordinarily virulent in the early seventies, but this is still a matter of conjecture. As to its effects there can unhappily be no question. The

disease appears to have entered Kamrup in 1888 and very soon produced a marked increase in the total number of deaths attributed to fever. It was especially virulent in the Boko and Chaygaon tahsils, in the Rani and Dakhin Sarubangshar mauzas in the Palasbari tahsil, and in the Ramdia, Beltala and Dimaria mauzas in the Gauhati tahsil. These places all lie south of the Brahmaputra, and the effects of the epidemic can be judged from the fact that the population of that part of Kamrup which lies south of the river decreased by nearly 12 per cent between 1881 and 1891. Serious mortality was also caused in the southern mauzas of the Barpeta subdivision, i. e., Barpeta, Chenga, Bagribari, and Bhawanipur. It is a characteristic of the disease that it gradually burns itself out in the localities which it attacks, and in 1892 it began to die down in Kamrup, though the district is not yet entirely free from this appalling scourge.

Though there can be little doubt that many lives are annually sacrificed which could be saved by proper treatment, it is satisfactory to know that of recent years there has been some increase in the facilities for obtaining medical aid, and in the extent to which the people avail themselves of the advantages now offered to them. The first dispensary was opened at Gauhati over thirty years ago. From the statement in the margin it appears that for every patient treated in 1881 there were 13 in 1901, while the number of operations performed rose from 161 to 982.

Year.	Dispensaries.	Patients treated.
	No.	No.
1881 ...	2	3,887
1891 ...	7	18,981
1901 ...	10	51,754

Increase in facilities for obtaining medical aid.

The principal dispensaries are those situated at Gauhati and Barpeta, which had a daily average attendance in 1903 of 102 and 72 patients respectively. The diseases for which treatment is most commonly applied are malarial fevers, worms, cutaneous disorders, dysentery and diarrhoea, dyspepsia and rheumatic affections. The number of patients treated at each dispensary in 1900 and the succeeding years will be found in Table XXV.

Survey.

A professional revenue survey of the district was made at the time when Assam was still a division of Bengal and the maps were published in 1872 and 1874. They are on the scale of one inch to the mile, and, in addition to topographical features, show sites of villages and the physical features of the country. A smaller map on the scale of four miles to the inch was published in 1888 and brought up to date in 1893. An area of 1,570 square miles which included the more densely populated portions of the district was cadastrally surveyed in the seasons of 1883—86, and 1890—93. The maps are on the scale of 16 inches to the mile, and, in addition to topographical features, show the boundaries of each field. Certain areas* which were excluded from the operations of the professional party were subsequently surveyed by local agency on the basis of a theodolite traverse, and the results obtained from the professional and the local agency have been utilised in the revision of the one-inch map.

* The area so surveyed in Kamrup up to 30th September 1900 was 432 square miles.

PREFACE.

The Gazetteer of Darrang lacks what is generally associated with works of this nature *i. e.* a directory. There is, however, only one town in the district, and that town has been described at length. The great bulk of the population live on tea gardens or in villages which do not lend themselves to a detailed description, and a directory of these villages would be entirely out of place. A list of all the tea gardens and of all villages that are centres of trade has, however, been appended to the volume, and reference has, been made in the text to all villages which are noted for any special industry. It is hardly necessary to add that whenever the Province is referred to it is to the old Province of Assam as constituted in 1904 that reference is made. My acknowledgments are due to the Deputy Commissioner, Mr. Lees, for his kindness in examining the work in proof.

August 1905.

B. C. ALLEN.

CONTENTS.

CHAPTER I.—PHYSICAL ASPECTS.

	Page.
Area and boundaries—General appearance of district— Hills—Rivers—Geology—Climate—Earthquakes— —Fauna	1 to 14

CHAPTER II.—HISTORY.

Summary—The Kingdom of Kamarupa—Ban Raja— Pratapa and Arimatta—Identity of Tezpur with capital of Pala kings—The Koch kings—History of Darrang Rajas—The Ahoms—Koch and Muhammadan invasions— The Ahom kings—The Moamaria insurrection—An- nexation of Assam by the British—Ahom government and social life—Frontier relations—History of the district under British administration—The Patharughat riots—Archæological remains—Chronological Table ..	15 to 71

CHAPTER I.

PHYSICAL ASPECTS.

Area and boundaries—General appearance of district—Hills—Rivers
—Geology—Climate—Earthquakes—Fauna.

The district of Darrang consists of a narrow strip of plain lying between the Himalayas and the Brahmaputra. It lies between $26^{\circ} 12'$ and $27^{\circ} 0' N.$ and $91^{\circ} 42'$ and $93^{\circ} 47' E.$, and is about 130 miles in length. At its eastern extremity the district is only about 12 miles broad. But, in its course towards the sea, the Brahmaputra gradually recedes further from the hills, and at Tezpur it is 28 miles as the crow flies from the northern boundary, while on the extreme west the plain is about 43 miles wide. The total area of the district is thus some 3,418 square miles. To the north, Darrang is bounded by Bhutan, Towang, a province of Thibet, and the hills occupied by the Aka and Dafia tribes. On the east, it adjoins Lakhimpur; on the south, it is separated by the Brahmaputra from Nowgong; and on the west it is bounded by Kamrup.

The Gohpur and Behali mauzas, at the eastern end of the district, are very sparsely peopled. Near the Brahmaputra, there is, as a rule, a belt of marshy country two or three miles in width, where sandy flats are covered with a dense growth of reeds and grass some ten to fifteen feet in height. There is very little tree growth in this region, though an occasional simul (*bombax malabaricum*) is to be seen; but here and there

Dimensions
and bound-
aries.

The eastern
end of the
district.

amongst the jungle are to be found *bils*, and stretches of rich grazing ground (*dolonis*) in which the cattle can wade knee deep in luscious grass. Near the trunk road, there are patches of cultivation, but there are places where for a considerable distance this great thoroughfare is shut in on either side by a wall of jungle. Further north the level rises, and the country lying at the foot of the hills is covered with dense ever-green forest.

The Bishnath plain.

West of Behali comes the Bishnath plain, an elevated region which is of older geological formation than the other parts of the district. The high bank reaches right down to the Brahmaputra, without the intervening belt of inundated land, and the plain itself is too high for the growth of transplanted rice, so that most of it is covered with short turf. The forest still stretches along the foot of the hills, but a portion of it has been cleared and planted out with tea, and the lower land is green with waving rice.

The country between Chutia and Orang.

Between Chutia and the Bhareli there is a good deal of cultivation, and the typical scenery of Assam is to be seen. Rice is grown in great stretches or *pathars*, round which are placed the houses of the cultivators; though it is not houses that one sees but the groves of feathery bamboos, slender palms, and broad-leaved plantains in which they are embedded. West of the Bhareli there is little but jungle till Tezpur itself is reached. Between Tezpur and the Gabharu civilization again reasserts itself, and near the town the country is one stretch of rice fields. Further north the forest has been felled and magnificent tea gardens

opened on the higher land, but west of the Gabharu population again falls off. Here and there are patches of cultivation, but there are wide stretches of jungle—forest near the hills, high reeds and elephant grass along the Brahmaputra, and shorter grass in the centre of the plain.

In Mangaldai the country falls into three natural divisions. Near the Brahmaputra there are jungle covered flats, on which the villagers raise crops of summer rice, pulse, and mustard. Further inland as the level rises, there is a rich expanse of rice land dotted over with groves of bamboos and palm trees; while to the north there is the high land inhabited by Kacharis, and now, to some extent, planted out with tea. It is a pleasant country which the Kacharis have selected for their home. The plain is covered with short springy turf, and, if in places the jungle is too high to allow a horseman to ride through it, it at any rate serves the useful purpose of affording cover to the partridge and the florican. A few miles to the north the mountains rise like a wall from the dead level of the plain, and in the winter time, the tops of the highest peaks are often flecked with snow. The soil is light and sandy, the roads are generally covered with short grass, and the traveller, as he makes his way along this upland country, frequently finds himself splashing through the fords which cross the numerous rivers that come hurrying from the hills. The Kachari villages are situated on the higher ground, but the pig-keeping propensities of their occupants are fatal to the

growth of trees, and, instead of being buried like the houses of the Assamese in a dense dankery of foliage, they stand up sharp and clear against the sky.

The whole of the district has much to appeal to the lover of the picturesque. To the south flows the mighty Brahmaputra, which, when rolling along in flood, seems more like a lake than a mere river. On the further bank the view is bounded by the Mikir Hills and the outlying portions of the Assam Range whose forest-clad sides shut in the plain with a soft blue wall. Along the north there is a wall of mountains. On the extreme east the outer range is but some 3,000 feet in height, but north of Tezpur, there is a hill not far beyond the frontier, whose summit is nearly 12,000 feet above the level of the sea. This, however, is as nothing in comparison with three mountains, ranging from 21,000 to 23,000 feet in height, whose snowy peaks stand out sharply in the cold blue sky of a winter's day, and make a fitting background to a charming scene.

**Mountain
system.**

Though in most parts of the district the view on a clear day is bounded on either side by hills, there are no hills or mountains of any size within the actual frontiers of Darrang. The most considerable range is a small spur projecting from the Himalayas into the north of the Balipara mauza, round which the Bhareli makes its way into the plains. Two low hills in this range, Bhalukpang and Gosainloga, will be referred to in the following chapter, as the ruins of old forts have been found here buried in the jungle. Along the river front, near the station of Tezpur, there is a range of low hills

whose summits are from 300 to 450 feet above sea level. West of the steamer ghat is the Auguri Parbat, at whose foot is the small shrine of Bhairab Pod, and beyond it is the Dhenukhana hill, on which there are the ruins of stone buildings. East of Tezpur, there is the Bamuni hill on which are the remains of the magnificent stone temple described in the following chapter, while beyond it is the Bhairabi hill, where there is a small shrine sacred to Bhairabi Debi. Close by is a hillock which bears the ominous name of Manukata, for here, tradition has it, human sacrifices were offered in the days of native rule. A little to the east are the Bhomoraguri hills, and beyond them the Rudrapod, so called because in the bed of the Brahmaputra close by there is a rock bearing the imprint of Siva's (Rudra's) footprint. North of the Rudrapod is the Samdhara hill, on which, in Ahom days, there was a temple. At the south-east corner of the Barchola mauza is the Singri hill, famous for a temple revered by Hindus and Buddhists alike, and, near the Brahmaputra in the Patharughat tahsil, there are eight or nine low hills, on one of which there is a shrine sacred to Ganesh. The only other hills which are found within the district are a few low spurs right on the northern frontier of Mangaldai.

The principal river of Darrang is the Brahmaputra, which flows right along its southern boundary. Even at this distance from its mouth, the Brahmaputra is an enormous river, and, during the rains, there is an unbroken stretch of water, about four miles in width, from Tezpur to the main bank of Nowgong. This is, however,

Rivers : the
Brahma-
putra.

partly due to the fact that to see the main bank it is necessary to turn to some extent upstream, as a huge sand bank, or *chur*, has formed opposite the town. These *churs* are a peculiar and somewhat objectionable feature in the river. Its waters come down loaded with sand and other matter in suspension, and a slight obstruction in the channel is sufficient to cause the sand to be deposited. In an incredibly short space of time an almond-shaped bank appears, which sometimes is washed away by the next flood, sometimes remains to form a considerable island. After a short time these islands are covered by a dense growth of jungle grass, and the main stream of the river not unfrequently changes its course, and shifts from side to side of the broad and sandy strath through which it makes its way.

The Bhare-
li.

The largest river in Darrang itself is the Bhareli, which rises in the Aka Hills and enters the district just to the north of Bhalukpang. It first flows east between two ranges of hills, and then turns sharply to the south, and flows a tortuous course to the Brahmaputra, which it joins about seven miles east of Tezpur town. The gorge through which the river makes its way is of great natural beauty. The hills covered with forest rise steeply from the water's edge, and the noble river hurries on over its rocky bed, now dashing down a rapid and foaming and boiling round a sunken rock, and anon lingering in still deep pools where the mahseer love to lie.

In its course through the plains the Bhareli, not unfrequently, overtops its banks, and, for the greater part of its way, it flows through jungle land. Its principal

tributaries are, on the left bank, the Upper, Khari, and Bar Dikrai, all of which come to it from the hills, and none of which flow for any distance through British territory. On the right bank there are the Upper and Lower Sonai and the Mansiri, which has numerous feeders from the Bhalukpang range. The Bhareli used originally to fall into the Brahmaputra close by the town of Tezpur, but some time prior to our occupation of the Province, it changed its course and shifted about five miles further east.

In addition to the Bhareli there are numerous other ^{other} rivers which carry off the drainage of the hills into the Brahmaputra. In the Gohpur mauza the principal stream is the Dubia or Kharo, which flows a southerly and westerly course down to the great river. Its largest tributary is the Balijan. The Behali mauza is watered by the Burai and the Bargang, both of which are considerable rivers; and between the two there is a large number of small streams, or jans, which unite and fall into the Brahmaputra near Behali. In the Chutia tahsil there are no rivers of great size, and the largest streams are the Sadharu, the Ghiladhari, and the Dikrai. West of Tezpur the drainage south of the hills is collected in a small stream called the Dipota, then comes the Sonarupa or Gabharu, the Pachnai, the Dhansiri and the Mangal-dai river with its tributary the Noanadi; while on the extreme west, the Barnadi forms for a considerable part of its course the boundary between Darrang and Kamrup. All of these rivers flow a tortuous southerly course from the hills towards the Brahmaputra, and all of them are

fed by numerous minor streams, most of which rise inside the district boundary and collect the local drainage. The banks of all these rivers are alternately abrupt and sloping, as the current sets from one side to the other and cuts away the bank where it impinges. The channels are usually sandy, and, during the dry season, all except the Bhareli, the Dhansiri and the Barnadi are fordable. Care must, however, be exercised in essaying the passage, as quicksands occasionally form in the river bed. Like most hill streams they are subject to strong freshets, and after heavy rain the traveller is liable to be stopped by a sudden rise in the river. The Barnadi, Dhansiri, and Noanadi have all, like the Bhareli, changed their courses of recent years, and the villagers do not, as a rule, care to settle in the immediate proximity of the river. The result is that the banks are generally covered with high jungle grass. In the north of Mangaldai, some of the streams which issue from the Himalayas disappear for a time in the light sandy soil, and do not develop a regular channel till they have advanced some distance into the plain. The extent to which these rivers are used as trade routes is described in the section on communications.

**Bils and
marshes.**

There is a steady fall in the level of the district towards the Brahmaputra, and there is thus but little tendency for the drainage of the country to collect in lakes and marshes. In the whole of the *sadr* subdivision there are only three *bils* of sufficient size to justify their being sold as public fisheries, and in Mangaldai there are but six. These *bils* are shallow pools of no great extent which

form in depressions in the lower parts of the district, generally near the Brahmaputra. In the cold weather they are usually surrounded by a belt of rich green grass which affords the most splendid grazing, and the whole is shut in by a wall of high reeds and elephant grass some ten or fifteen feet in height.

Almost the whole of the district consists of an alluvial **Geology.** deposit of clay and sand in varying proportions, ranging from pure sand near the Brahmaputra to a clay so stiff that it is quite unfit for cultivation. The Bishnath plain and an elevated tract of land north of Tezpur known as the high bank are, apparently, the remains of an older alluvium which elsewhere has disappeared. The soil is here distinguished from that of the rest of the plain by its closer texture and reddish colour. The low hills near the Brahmaputra are of gneissic origin, and are largely composed of rocks which make an excellent building stone. Limestone of an inferior quality is found in the Barnadi, and travertine, containing as much as 90 per cent of lime, has been discovered just beyond the British frontier in the beds of the Nanai and Dhansiri rivers. Coal, also, is known to exist outside the northern boundary, in the gorges of the Bargang and the Dikal, but not, it is believed, in valuable quantities or of good quality*. In the days of native rule gold used to be washed from the sands of the Bhareli, the Burai, and the Dhansiri, and it is said that each man would obtain about one ounce of gold in the three months, November to

* Statistical Account of Assam, Vol. I, p. 103.

January, during which the work was carried on. Almost as soon as the district came under British rule, the gold washers abandoned this special work, which had been entrusted to them by the Ahom Rajas, and it is said that even in 1835 very little gold was washed for, in pite of a strong demand for the precious metal*. At the beginning of the nineteenth century, the Bhutias are said to have brought down as much as 200 ounces of gold every cold weather, but practically no gold is exported from the hills along the north at the present day.

Climate.

The climate of Darrang does not differ materially from that of the rest of Assam Proper. From the middle of November till the end of February the weather is all that could be desired. The total rainfall during that period is only about two inches, the sky is clear, the sun, though bright, has little power, and the air is cool and pleasant. In March the temperature begins to rise, but the copious showers of April, when six or seven inches of rain are usually recorded, effectually prevent the development of anything in any way resembling the hot weather of Upper India. Between May and September the rainfall is fairly heavy, the air becomes surcharged with moisture, and the damp heat is trying alike to Europeans and to natives. The average maximum shade temperature of these five months ranges from 86 to 90 degrees Fahrenheit, but, in an excessively humid atmosphere, even such a moderate degree of heat has a relaxing effect upon the constitution. In October, the temperature begins to fall and the nights are fairly cool, but

* Lieutenant Mathie's report, para. 72. Ditto, para. 33.

the winter does not actually set in till the middle of November. The average maximum and minimum temperature in each month will be found in Table I.

The average monthly rainfall at certain stations will be found in Table II. Near the hills, at Kherkheria on the west and at Gohpur on the east of the district, it is over 100 inches, while at Mangaldai it is only 70 and at Tezpur 73 inches. About two-thirds of the total rainfall of the year falls in the four months, May to August.

Darrang suffers little from destructive storms and floods. The Brahmaputra and many of its tributaries occasionally overflow their banks, but the area subject to inundation is well known, and the villagers do not attempt to cultivate anything more than summer rice or cold weather crops in these flooded tracts. Hail storms occasionally do damage, especially on tea gardens, but destructive cyclones are quite unknown. Thunder storms are common in the rains, but they afford a welcome relief by cooling the overheated atmosphere. Dust storms never occur, as the country is so completely clothed in fresh green vegetation, that dust, the material of these unpleasing phenomena of nature, is not forthcoming.

But Darrang, like the rest of Assam, is a seismic area, and the crust of the earth from time to time gives evidence of its instability. The Ahom chronicles not unfrequently refer to serious earthquakes; and the army advancing under Mir Jumla to the invasion of Assam was much alarmed by the occurrence of one of these cataclysms of nature.

**The earth-
quake of
1897.**

The most serious earthquake on record was, however, the one which occurred on June 12th, 1897. This earthquake was felt over an area of 1,750,000 square miles, from Rangoon in the south-east to Kangra in the north-west, from the Himalayas to Masulipatam, and serious damage was done to masonry buildings over an area of 145,000 square miles*. The area of maximum disturbance was a tract of country of the shape of a cocked hat, whose base line ran from Rangpur to Jaintiapur, while the top of the crown was near Barpeta. The effects of the shock in Mangaldai were serious. The dak bungalow and the residence of the Subdivisional Officer were wrecked, the walls of the cutchery and the treasury collapsed, and serious damage was done to the raised roads, which in places were shaken down to the level of the neighbouring fields. In Tezpur itself the dak bungalow, the Deputy Commissioner's bungalow, and the Planters Club were all seriously injured. The greater part of the northern and western walls of the jail were thrown down, the eastern wall of the church collapsed, and the treasury and cutchery both were injured. On the Tezpur-Balipara Railway the permanent way between Sessa and Rangapara was in places shaken level with the plain, and the rails were bent and twisted out of position. Fortunately, however, no loss of life occurred, and the actual damage done was small in comparison with the terrible ruin wrought in Gauhati and Shillong.

Fauna.

The wild animals of the district include elephants, rhinoceros, bison (*bos gaurus*), buffalo, tigers, leopards,

* Memoirs of the Geological Survey of India, Vol. XXIX, p. 52.

bears, wild pig and different kinds of deer, of which the principal varieties are the sambar (*cervus unicolor*), the *barasingha* or swamp deer (*cervus duraucei*), the hog deer (*cervus porcinus*), the barking deer (*cervulus muntjac*) and the spotted deer (*cervus axis*).

Elephants are fairly common, especially near the hills, **Elephants.** and when the crops are ripening do much damage unless the numbers of the herds are regularly kept down. For this purpose the district is divided into seven mahals or tracts. The right to hunt in each mahal is sold by auction and the lessee is required to pay a royalty of Rs. 100 on every animal captured. The method usually employed is that known as *mela shikar*. Mahouts mounted on staunch and well-trained elephants pursue the herd which generally takes to flight. The chase is of a most arduous and exciting character. The great animals go crashing through the thickest jungle and over rough and treacherous ground at a surprising pace, and the hunter is liable to be torn by the beautiful but thorny cane brake, or, were he not very agile, to be swept from his seat by the boughs of an overhanging tree. After a time the younger animals begin to flag and lag behind, and it is then that the opportunity of the pursuer comes. Two hunters single out a likely beast, drive their elephants on either side, and deftly throw a noose over its neck. The two ends of the noose are firmly fastened to the *kunkis*, as the hunting elephants are called, and as they close in on either side, the captured animal is unable to escape, or to do much injury to his captors

who are generally considerably larger than their victim. The wild elephant is then brought back to camp where it is tied up for a time and gradually tamed.

Forty-six animals were caught in 1902-03, the last year in which the mahals were sold by the Deputy Commissioner. Rhinoceros live in the swamps that fringe the Brahmaputra, or near the hills, and are now extremely scarce. They breed slowly, and, as the horn is worth more than its weight in silver, and the flesh is prized as food, they present a tempting mark to the native hunter. Wild buffaloes are occasionally found in the same locality, and wild bulls sometimes serve the tame cows that are kept by the Nepalese on the Brahmaputra *churs*. Bison are generally found near the hills and in the neighbourhood of tree forest; tigers, leopards and bears are met with in almost every part of the district. Wild animals cause little loss of human life, but, in 1903, are said to have accounted for over four thousand head of cattle. The number of human beings killed in that year by different animals was as follows:—Elephants 2, tigers 12, bears 9, wild buffaloes 6, wild pigs 5, snakes 14, total 48. Rewards were at the same time paid for the destruction of 30 tigers, 66 leopards, and 17 bears.

Small game include wild geese and duck, snipe, florican (*sypheotis bengalensis*), black and marsh partridge, pheasants, jungle fowl, and hares.

CHAPTER II.

HISTORY.

Summary—The Kingdom of Kamarupa—Ban Raja—Pratapa and Arimatta—Identity of Tezpur with capital of Pala kings—The Koch kings—History of Darrang Rajas—The Ahoms—Koch and Muhammadan invasions—The Ahom kings—The Moamaria insurrection—Annexation of Assam by the British—Ahom government and social life—Frontier relations—History of the district under British administration—The Patharughat riots—Archæological remains—Chronological table.

It is doubtful whether at any period the whole of the **Summary.** country, which is now known as the district of Darrang, was a separate polity under its own ruler, and its history has to be considered in connection with that of the various States of which from time to time it formed a part. It was originally included in the ancient Hindu kingdom of Kamarupa, which is mentioned in the Mahabharata, and which at one time occupied North-Eastern Bengal, and a great part of what is now known as the Province of Assam. The story of this kingdom dating, as it presumably does, from about the twelfth century B. C. is largely a matter of doubtful and fragmentary tradition, and we can hardly be said to know much of the history of Darrang before the beginning of the sixteenth century A. D., when it was incorporated in the territories of the Koch princes. The decline of the Koch kingdom was, however, as rapid as its rise, and at the beginning of the

seventeenth century the Ahoms, who had been called in to assist the Koch Raja against the Muhammadans, began to strengthen their hold upon the district. It is doubtful, moreover, whether at any time the sovereignty of the Koch kings extended to the east of the Bhareli, since, as far back as 1523, the Ahoms established a colony of Chutiyas on the left bank of that river. The Bhareli at this time seems to have been the western boundary of the Ahom territories on the north bank, as, in 1529, the Ahom king is said to have taken up his headquarters at Bishnath, and to have ordered his generals to plunder the country on the west of the Bhareli. The historian of Mir Jumla's invasion in 1661 refers to the Koch Raja of Darrang as a tributary of the Ahom king, and, in 1725, his territories only consisted of that portion of the Mangaldai subdivision which lies south of the Gohain Kamala Ali. When the Ahom power was shaken to its very foundations by the Moamaria insurrection, the Raja of that time, Krishna Narayan, endeavoured to assert his independence; but he was defeated in 1792 by Captain Welsh, and reduced again to the position of a tributary chief. From that time forward, Darrang continued under the rule of the Ahoms, as far as any form of rule can be said to have existed in that period of anarchy and confusion, and passed, with the rest of Assam, into the hands of the British when the Burmese were driven out of the valley in 1825.

The kingdom of Kamarupa. According to the *Yogini Tantra*, the kingdom of Kamarupa extended from the Karatoya river, on the 1200 B. C. western boundaries of Rangpur, to the Dikrai in the 1000 A.D.

east of the Darrang district. It was divided into four portions, *i. e.*, Kamapith from the Karatoya to the Sankosh; Ratnapith from the Sankosh to the Rupahi; Suvarnapith from the Rupahi to the Bhareli; and Saumarpith from the Bhareli to the Dikrai. The earliest king of Kamarupa of whom anything in particular is recorded is Narak, who is said to have been the son of the earth by Vishnu, and who defeated and slew his predecessor Ghatak. He established his capital at Pragjyotishpura, the modern Gauhati, and seems to have been a powerful and prosperous, though somewhat headstrong, prince. He was appointed the guardian of Kamakhya, and his name still lives amongst the people as the builder of the causeway up the southern face of the hill Nilachal, on which the temple of Kamakhya stands. He was succeeded by his son Bhagadatta, who is mentioned in the Mahabharata as fighting on the side of the Kauravas at the great battle of Kurukshetra; and we thus seem justified in assuming that fully a thousand years before Christ, Darrang formed part of a powerful kingdom ruled by a line of non-Aryan princes.

It is not Narak, however, but Ban Raja whose name **Ban Raja.** is most frequently in the mouths of the people of Darrang. Tradition says that his fortress stood on the site now occupied by the Deputy Commissioner's office, and that he built the magnificent temples, the ruins of which are still to be seen in the immediate vicinity of the town. His daughter was beloved by Anirudha, son of Krishna, and when Ban seized the amorous prince, he was

rescued by his father, who fought a bloody battle on the plain to the west of Tezpur.

Two large tanks in the neighbourhood are said to have been constructed by Ban, and one of them still bears the name of his prime minister Kumbhanda. The Akas to this day claim descent from this mighty prince, through his grandson Bhaluka, the remains of whose capital are still to be seen in the gorge of the Bhareli at Bhalukpang. Tezpur is not, however, the only town that claims to have been Ban Raja's capital. Similar pretensions are put forward for a place called Ban Raja's garh, a little to the south of Dinajpur. Local tradition, which in a matter of this kind is of very little value, is the only authority for connecting Ban Raja with the magnificent temple ruins near Tezpur; and local tradition in this particular instance would seem to contradict itself, as it seems fairly clear that the fort at Bhalukpang and the temple at Tezpur cannot have been erected by the same dynasty or at the same period.

The copper plates of the eleventh century.

Further information with regard to the rulers of Kamarupa is given in certain copper plates which on palaeographical grounds have been assigned to the eleventh century A. D.* These plates are valuable evidence as to the state of the country at the time at which they were engraved, but their account of the genealogy of the reigning king must obviously be received with some degree of caution. The dynasty of Narak is said to have been displaced by Cala Stambha, a Mleccha or foreign con-

* For a description of these plates see J. A. S. B., Vol. LXVI, pp. 113 and 285, and Vol. LXVII, Pt. I, No. 1, p. 99.

queror, whose line ended in the person of Sri Harisa. Another family of foreign princes then came to the throne, the first of whom was Pralambha and the last Tyaga Singh. The dynasty of Narak was then restored in the person of Brahmapala. The invasion of the Mlecchas and their subsequent expulsion not improbably corresponds with the great irruption of the Bodos, who, according to their own traditions, were at one time ruling at Gauhati and were subsequently driven eastwards to Dimapur, but the whole of this period is involved in great obscurity.

In 640 A. D. Hiuen Tsiang visited Assam, and the record of his travels affords a momentary glimpse of the conditions of the country; a glimpse which is not unlike the view afforded by a flash of lightening on a dark and stormy night. The landscape, which has been shrouded in impenetrable gloom, is suddenly disclosed to view, and with equal rapidity is engulfed again in the blackest darkness; and nothing definite is known of the fortunes of Assam and its inhabitants either immediately before or after the visit of the great Chinese traveller. The country seems to have advanced some distance on the path of civilization. The soil was deep and fertile, the towns surrounded by moats, the people fierce in appearance but upright and studious. Hinduism was the national religion, and, though Buddhism was not prohibited, its milder tenets had comparatively few followers.

Two other names, those of Pratapa and Arimatta, are connected with the legendary history of Darrang.

**The visit of
Hiuen
Tsiang, 640
A. D.**

**Pratapa
and
Arimatta.**

Pratapa is said to have belonged to the Nagsankar dynasty, who reigned between the third and seventh centuries A. D., though, as will subsequently be shown, very little reliance can be placed upon these dates. Pratapa's capital was situated at Ratnapur, which was subsequently engulfed by the Brahmaputra when it changed its course to form the Majuli; but he built a great fort at Pratapgarh, the remains of which are to be seen at the present day. Another story says that Pratapa and Bhaluka were the same, and that he received the latter name because he was begotten by Siva, in the form of a bear (*bhaluk*), on the daughter of a Kachari prime minister, who had fled to the north bank of the Brahmaputra to escape from the oppressions of his royal mistress. The girl was afterwards married by Somapal, the king of the country, who made her son his heir.

Arimatta. Arimatta is said to have been the grandson of Pratapa, or, according to another account, the son of Pratapa's wife who had been raped by the Brahmaputra. He seems to have been a powerful prince, and is said to have thrown up the huge entrenchment which is still to be seen near Betna in Kamrup. The Majuligarh, in the Chutia mauza, is also attributed to him. He killed his father either accidentally out hunting, or in open war in ignorance of his identity, and attempted to make atonement by offering gold and jewels at Jagannath and also to the Ganges. His offerings were rejected, and he finally threw them into the waters of the Dikho and then drowned himself. According to another legend, he

was accidentally shot by his son Jangal, whose capital was situated in Nowgong. The obscurity in which the history of this time is veiled can, however, be measured from the fact that, while Pratapa's dynasty is said to have ended in the seventh century A. D., Arimatta is said to have lived in the thirteenth.

We are, however, treading upon more certain ground when dealing with the Bargaon plate, which on the evidence of palæography has been assigned to the earlier half of the eleventh century A. D. It records the grant of a piece of land on the north bank of the Brahmaputra to a Brahman, and extols the virtues and magnificence of the donor, King Ratnapala, the son of the Brahmapala, in whose person the line of Narak had been restored to the sovereignty of Kamrup.

The Bargaon plate of the eleventh century.

Ratnapala seems to have been a powerful prince, and his capital Durjaya on the Luhit is described in glowing terms. It was crowded with soldiers and merchants, and adorned with learned men, priests, and poets. A thousand plastered turrets hid the sun, and the strength of its ramparts were a source of mortification, or, as the inscription quaintly puts it, "pulmonary consumption," to various other mighty chiefs. The king studded the earth with his whitewashed temples and the pillar monuments of his victories. He was evidently no mere local princeling, as he obtained great wealth from his copper mines; and there are no copper mines anywhere in the neighbourhood of Tezpur. Considerable allowance has to be made for the exuberance of the oriental imagination, but the precise injunctions issued to

the "people of the Brahman and other castes, headed by the *district revenue officers and their clerks*," with regard to the actual grant of land, suggest a systematic and well-organized Government. Similar conclusions are to be drawn from the following description of the land itself and of its easements. "Be it known to you that this land, together with its houses, paddy-fields, dry land, water, cattle-pastures, refuse-lands, etc., of whatever kind it may be, inclusive of any place within its borders, and freed from all nuisances on account of the fastening of elephants, the fastening of boats, the searching for thieves, the inflicting of punishments, the tenants' taxes, the imposts of various causes, and the pasturing of animals, such as elephants, horses, camels, cattle, buffaloes, goats and sheep, as set forth in this charter, is given to him for the sake of the good and the glory of my father and myself."

**Durjaya
possibly
identical
with
Tezpur.**

It seems far from improbable that Durjaya was located on the site of the present station of Tezpur. It was situated on the banks of the Brahmaputra, and the number of places in which a city could be built in the neighbourhood of that treacherous and shifting river is not large. The town was evidently not identical with Gauhati, as Ratnapala is distinctly described as being the lord of Pragjyotisha (Gauhati) but as living at Durjaya; and it seems much more likely that Durjaya was situated at Tezpur than at Silghat or Bishnath, two of the few places in the valley where the rocks come down to the river's edge. If this is so, the magnificent stone temple, east of Tezpur, was probably constructed

by one of these Pala kings about the eleventh century A. D., and to this dynasty must be assigned the fine masonry remains which are still lying about the station in great profusion. These pillars and blocks of massive stone, which are enriched with fine carving, must evidently have been executed under the orders of a powerful prince, in whose capital the arts of civilization had made considerable progress, and this is a description which could not unsuitably be applied to the Pala kings.* It is a somewhat humiliating reflection that a thousand years ago the material civilization of Tezpur seems to have been in many respects much in advance of that in existence at the present day, when neither artisans, merchants, or learned men are to be found amongst the Assamese. But the Pala princes, with their power and magnificence, passed away many centuries before the British obtained possession of Assam, and Darrang became for a time a sort of debatable land partly under Koch and partly under Ahom rule.

Little or nothing is known of the decline of the Pala **The Koch** kings of Durjaya, and it is doubtful whether Darrang **kings.** ever formed part of the territories of the Khyen kings of Kamatapur in Kuch Bihar, the last of whose line, Nilambar, was conquered by the Muhammadans in 1498 A. D. In the sixteenth century, the eastern portion of

* Pala is a common title and it should be noted that these princes were not necessarily connected with the Pala kings of Bengal. An anonymous writer in the *Calcutta Review*, Vol. XLV, p. 521, suggests that the Tezpur temple may have been erected by Lalitaditya, a king of Kashmir, who, he says, invaded Assam in the middle of the eighth century A. D. This is, however, a mere hypothesis, which *prima facie* seems to be most improbable.

the district seems to have passed under the influence of the Ahoms, while west of the Bhareli the Koches were the dominant power.

The founder of the Koch kingdom was a Mech named Viswa Singh, who according to tradition was the son of Hira, the wife of one Haria Mandal, by Siva, who assumed the shape of her husband, and thus induced her to admit him to her embraces.* Viswa Singh subdued the petty princes, who surrounded him, founded a magnificent city in Kuch Bihar and reduced his state to order. The whole population was divided up into different corps under officers of increasing dignity, a *thakuria* being appointed over every 20 coolies, a *saikia* over every 100, a *hazari* over 1,000, an *umra* over 3,000, and a *nawab* over 66,000. He took a census of his subjects and found that the number capable of bearing arms was 5,225,000, an obvious exaggeration. He is said to have marched against the Ahoms, but to have abandoned the expedition owing to the collapse of his commissariat, but the Ahom version which states that he was defeated and made tributary seems a more probable explanation of the failure of the expedition.

War
Narayan,
1534-1584
A. D.

Viswa Singh died after a reign of 25 years, and was succeeded in 1534 A. D. by his son Malla Deva, who assumed the name of Nar Narayan. The reign of this prince represents the zenith of the Koch power, and his armies, which were led by his brother Sukladwaj or

* The following account of the Koch kingdom and the Darrang Rajas is taken from an interesting paper on the Koch kings of Kamarupa by Mr. E. A. Gait, C. S., Journal of the Asiatic Society of Bengal, Volume LXII, Part I, No. 4 of 1893.

Silarai, met with almost unvarying success. He first attacked the Ahoms, but, mindful of his father's failure, commenced his operations by building a great military road along the north bank of the Brahmaputra, and constructing tanks at regular intervals along it. The work was entrusted to his brother Gohain Kamala, and the road, much of which is still in existence, bears the name of Gohain Kamala Ali to the present day. Nar Narayan entered the Ahom capital Gargaon (the modern Nazira) and did not leave till he had received the submission of the Ahom king. The Kachari Raja and the Raja of Manipur were then reduced to the position of feudatory chiefs, and the kings of Jaintia, Tippera, and Sylhet conquered and slain. Further successes were obtained over the rulers of Khairam and Dimuria, but the tide of fortune turned when an attack was made on the kingdom of Gaur. The Koch army was routed and Silarai himself made prisoner. Nar Narayan would not, however, accept this defeat as final, and a few years later joined with the Emperor Akbar in a second attack upon the Pasha of Gaur. This enterprise was crowned with success, and Gaur was divided between the Emperor of Delhi and the Koch king.

Within the space of two generations the Koch kingdom had attained to an extraordinary height of power and prosperity, but its decline was as rapid as its rise. For a long time Nar Narayan had no male offspring, and Silarai's son, Raghu Rai, was regarded as his heir. When this boy was approaching manhood, one of his uncle's wives gave birth to a son called Lakshmi Narayan,

**Decline of
Koch King-
dom,
Raghu Rai,
1581-1593
A. D.**

and Raghu Rai, realizing that he had now no hope of succeeding to the throne, withdrew from the capital to Barnagar in the Barpeta subdivision of Kamrup. Nar Narayan endeavoured to compel him to return, but his soldiers were defeated and the king weakly resolved to divide his kingdom.* The territory east of the Sankosh was made over to Raghu Rai, while Lakshmi Narayan received the part that lay west of that river. Raghu Rai continued to reside at Barnagar, and seems to have been much devoted to religious exercises.

**Parikshit,
1593-1614
A. D.**

He was succeeded by his son Parikshit in 1593 A. D. who built a town at North Gauhati, and mounted cannon at Pandunath. War then broke out between Parikshit and his cousin Lakshmi Narayan † The latter was defeated but called in the Muhammadans to his aid, and on their arrival the situation was reversed. Mukarram Khan advanced with 6,000 horse, 12,000 foot, and 500 ships and took Parikshit's fort at Dhubri. The Koch king then essayed a naval engagement on the Gadadhar river, but was defeated, and retreated to Barnagar, where he surrendered in 1614 A.D., and was sent to the court of the Mughal Emperor.

His brother Bali Narayan, or Baldeo as he is called by the Muhammadan historians, fled to the Ahoms, and the struggle between the two powers continued for some

* According to Buchanan Hamilton, the kingdom was founded by Hajo, father of Hira and grandfather of Viswa Singh, and divided by Viswa Singh who allotted the portion east of the Sankosh to Sukladwaj or Silasai, and that west of the river to Nar Narayan. On general grounds, however, this account seems to be less probable than that given in the body of the text.

† According to one version the quarrel dated from the time of Raghu Rai who declined to pay tribute after the death of Nar Narayan, and set up his own mint, Buranji No. 6, p. 123.

years with varying success. Ultimately the Koch king was completely crushed and he died at Singri in 1637 A.D.

From this time onward the power of the Darrang* **Bali Narayan, 1614-1637. Subsequent history of Darrang Rajas.** Rajas steadily declined. Bali Narayan was succeeded by his son, Mahendra Narayan, who died in 1643. His son, Chandra Narayan, reigned till 1660, and was followed by his son, Surya Narayan, who is said to have been defeated by the Muhammadans in 1682, and taken captive to Delhi. The Raja's minor brother, Indra Narayan, was placed upon the throne, and during his reign the Ahoms strengthened their hold upon the district. At the beginning of the eighteenth century, the country was surveyed under the orders of Sib Singh, with a view, no doubt, to the more precise assessment of tribute. When Indra Narayan's son, Aditya Narayan, succeeded in 1725, his kingdom had been reduced to the portion of the Mangaldai subdivision which lay south of the Gohain Kamala Ali, and a considerable part even of this small principality was wrested from him by his younger brother.

In 1792 A.D., when the Ahom kingdom was dis- **Krishna Narayan revolts and is deposed.** tracted by the bloody insurrection of the Moamarias, and when the king, Gaurinath, had been driven to Gauhati and was, as he himself expressed it, "like a laden boat in the act of sinking," Krishna Narayan, the Raja of Darrang, endeavoured to assert his independence. He hired sepoys from Bengal, and took up a position on the

* This is the name by which they are generally known, but as a matter of fact the Darrang Rajas never seem to have ruled over the eastern part of the Darrang district.

north bank of the Brahmaputra in the neighbourhood of Gauhati. He was, however, easily defeated by Captain Welsh, who had been sent to the assistance of the Ahom Raja, and in 1805 was deposed by Kamaleswar Singh, Gaurinath's successor, at a ceremony for which he seems to have been somewhat unfairly required to pay a fee of Rs. 120.* Samudra Narayan, a descendant of the same family, was appointed in his place, and was warned by the Ahom Raja that he must cherish the people entrusted to him, assist them in their troubles, and not look upon them as the mere instruments of his pleasure and the sources from which his revenue was drawn. He was also ordered to protect his frontier against the aggressions of the Bhutias, and was told to apply to the Ahom ministers for assistance, if he found himself unequal to the task imposed upon him.

**Darrang
Rajas sink
to the posi-
tion of
samindars.**

Later on, the position of the Darrang Rajas was still further reduced, and instead of being tributaries, they were merely the agents of the Ahom king. In lieu of salary they were allowed the lands cultivated by their personal slaves and servants, which were confirmed to them at half the ordinary rates of revenue when the British came into occupation of the country. This privilege attached, however, to the Raja, and not to the land itself, and if he alienated any portion of his estates it became at once liable to assessment at full rates.

The Ahoms. In the preceding paragraphs it has been shown that the power of the Koches was not at any time firmly established in the east of Darrang, and it is doubtful

* Buranji No. 9.

whether, even in Mangaldai, they could properly be described as independent princes after the death of Bali Narayan in 1637 A. D. It is, in fact, to the Ahoms that we must look for the seat of real sovereignty, during the three hundred years that preceded the cession of the Brahmaputra Valley to the British in 1826. These people were a Shan tribe from the kingdom of Pong in the upper valley of the Irawadi, who, at the beginning of the thirteenth century, crossed the Patkai and settled in the south of the territory which has since been formed into the districts of Sibsagar and Lakhimpur. The country at the foot of the hills was occupied by tribes of Morans and Borahis whom they easily subdued, and who were absorbed by intermarriage with their conquerors. To the west and north, however, they were confronted by far more powerful nations. Upper Assam was ruled by the Chutiyas, a tribe of Bodo origin, who are believed to have entered the valley from the north-east and to have conquered the Hindu kings whom they found in possession of the country. On the west there was the strong Kachari kingdom, with its capital at Dimapur. Early in the fourteenth century, the Ahoms became involved in war with the Chutiyas, but their final victory did not come till 1523 A. D., when the Chutiya king was defeated and his country annexed by Suhunmung, the "Dihingia Raja," who reigned from 1497—1539 A. D. This prince was successful in the west as well as in the north, and in 1536, he sacked Dimapur, killed the Kachari king, and compelled his successor to remove his capital to Maibang, on the northern slopes of the North Cachar Hills.

**Koch and
Muhamma-
dan inva-
sions.**

The Ahoms were now supreme in Upper Assam, and it is evident that the eastern portion of Darrang was included in their territory, as in 1523 a large number of Chutiya families were deported to a place a little to the east of the Bhareli river, which bears the name Sootea or Chutia to the present day. They were still, however, exposed to danger from the Koch and Muhammadan powers in the west. In 1532, they defeated with great slaughter a Muhammadan invader named Turbuk on the banks of the Bhareli river ; but a few years later they were conquered by the Koch king, Nar Narayan, who occupied their capital Gargaon, the modern Nazira, and exacted tribute from the Ahom prince.

At the beginning of the seventeenth century, they were again involved in war with the Muhammadans, as their king Pratap Singh declined to surrender Bali Narayan, the Koch prince, who had fled to him for protection, and who sagaciously pointed out that in their own interests it was most desirable that they should maintain a buffer state between themselves and the Muhammadans. Most of the fighting took place in Lower Assam, but in 1615 A. D., a Musalman army under Satrajit advanced as far as the Bhareli to avenge a Muhammadan trader, who had been put to death by the Ahom king. The Muhammadans, though at first successful, were subsequently defeated both on land and water with great slaughter. The Ahoms are said to have crossed the Bhareli by a bridge and to have turned the flank of their opponents. The bulk of the invaders were killed, and the few prisoners who were taken were subsequently put to death

by the Ahom generals, much to the indignation of their ruler, who degraded his officers for this cold blooded murder.

The war then dragged on in Lower Assam, but in 1637 A. D., on the death of Bali Narayan, the Barnadi, which at present forms the western boundary of Darrang, was fixed as the frontier between the Muhammadan and Ahom territory. In 1658, the Ahoms took advantage of the confusion that ensued after the death of Shah Jehan to extend their arms to the Sankosh ; but three years later they were driven back by Mir Jumla, the Nawab of Dacca, who occupied Gargaon, and there concluded a treaty with the Ahom Raja, Sutumla, otherwise known as Jaiyadwaj Singh. In the course of their march up the valley the Muhammadans took the strong fort at Simlaghor*, which seems to have been situated near Silghat, whereupon the Assamese evacuated the fort of Chamdara on the opposite bank of the Brahmaputra. A hill a little to the east of Tezpur is known as Chamdara at the present day, and there are the remains of a fine embankment running northwards from it to the Bhareli. The stars in their courses fought, however, on the Ahom side. The rains set in with a severity exceptional even in that rainy land ; the country was converted into a swamp, and disease made havoc of the Muhammadans crowded together in their water-logged camp. A large number of men were lost in the retreat down the valley, and by 1667, the Ahoms had again established themselves at

*Blochman in J. A. S. B., Vol. XI.1, Part 1, p. 71, places Simlaghor north of the Brahmaputra, but in this he is evidently mistaken.

Gauhati. A few years later this town was retaken by the Muhammadans, but it was captured again by the Ahoms during the reign of Gadadhar Singh (1681—1695), and from that time onward Goalpara remained the frontier outpost of the Muhammadan dominions.

**Rudra
Singh,
1695—1714
A. D.**

The zenith of the Ahom power was reached in the reign of Rudra Singh, who founded a new capital at Rangpur, and waged successful war against the Rajas of Cachar and Jaintia. Two large forces marched, the one through the North Cachar Hills, the other through the Jaintia Hills to Jaintiapur, and the general in command succeeded in arresting the Jaintia Raja and deported him to the Assam Valley. The Ahoms were, however, unable to impose their yoke upon the free and savage highlanders, who rose as one man and butchered the garrisons who had been left in a chain of forts across the Jaintia Hills. Rudra Singh was the first of the Ahom kings to publicly become the disciple of a Hindu priest, and after his death the power of the Ahom kingdom began steadily to decline.

**Sib Singh,
1714—1744
A. D.**

His son Sib Singh was a weak prince much under the influence of his wives, whose name has come down to posterity as excavator of the great tank near which the present station of Sibsagar (Sib's tank) stands.

Both he and his two successors were ardent Saktists and erected numerous temples and made liberal grants of land and *paiks* for the maintenance of their special form of Hinduism.

The reign of his successor Pramatta Singh was uneventful, and during the incumbency of the next prince, Rajeswar Singh, the signs of the decay of the Ahom power became all too clear. The Raja of Manipur was driven from his home and applied to the Ahom king for aid. Orders were issued for the despatch of an expedition, but the nobles, to whom the command was entrusted, excused themselves on various grounds and declined the proffered honour. The army lost its way when endeavouring to cross the Patkai, a large number of men perished, and though ultimately the Manipur Raja succeeded in regaining his dominions, it does not appear that the assistance of the Ahoms materially contributed towards his success.

Pramatta Singh, 1744-1751.
Rajeswar Singh, 1751-1769.

Lakshmi Singh's reign was signalized by the outbreak of the Moamaria insurrection. The causes of this insurrection are not quite clear. According to the chroniclers, a certain Hathidharia Chungi with one Nahor Kachari came to offer their annual tribute of elephants to the king. The elephant which they tendered to the Borborua was a lean and sorry animal, and, as an expression of his disapproval, he cut off their hair and noses, flogged them, and drove them away. Boiling with indignation at this outrage, Nahor proceeded to the house of a Hari woman, whose daughter he espoused, and from whom he received a set of metal plates, covered with mystical incantations to confound the enemy. He then applied to the Moamaria gosain for help, which was readily afforded him, and the standard of revolt was raised. This is the account given by the Ahom chroniclers, and

Lakshmi Singh, 1769-1780.
The Moamaria insurrection.

it differs to some extent from the story as told by the Moamaria gosain at the present day. According to this authority, the leaders of the rebellion were two Moamarias named Nahor and Ragho Neogay, who, after they had been punished for failing to deliver the elephants required, went for assistance to their gosain. The gosain himself declined to listen to their proposals, but they succeeded in winning over his son Gagini Bardekha, who gave them a weapon consecrated with the magic plates of the Kalpataru. The Kalpataru was a sacred book which Anirudha is said to have obtained from Sankar Deb, though the Ahom chroniclers contemptuously assert that it was the property of a sweeper woman.

**Success and
subsequent
defeat of
Moamarias.**

From the very first the rebels carried all before them. The royal armies were defeated under circumstances which suggest that men and officers alike were guilty of gross incompetence and cowardice ; and Lakshmi Singh was driven from his capital and captured. The insurgents then proceeded to appoint Ramakanta, the son of Nahor, to be their Raja. Marauding parties harried the country on every side, and the misery of the common people was extreme. A report at last gained ground that orders had been issued for the execution of all the former officers of state, and this incited the adherents of the king to make one final effort. The signal for the attack is said to have been given by one of the wives of Lakshmi Singh. Ragho, who was one of the most influential men amongst the Moamarias, had forcibly taken her to wife, and, as he was bending down at the Bihu to offer his

largess to a dancing boy, she cut him down with a sword. On the death of their leader, the rebel forces were surprised and scattered, and a pitiless vengeance taken that spared neither age nor sex.* The house of the Moamaria mahunt was surrounded, and almost the whole of his family was killed before his eyes, while all the officers appointed by the Moamaris were seized and beaten to death. The wives of the rebel prince were treated with savage cruelty. One of them was flogged to death, while two others had their ears and noses cut off and their eyes put out.

In 1780, Lakshmi Singh died and was succeeded by his son Gaurinath, in whose reign the Moamaria insurrection broke out anew, and with increased violence. At first, the king's troops met with some measure of success, and orders were issued outlawing the rebels and authorizing any person to kill any Moamaria he might meet, regardless of time, place, sex, or age. Such orders seem to have been only too well adapted to the temper of the people, and, according to the Ahom chronicler, "the villagers thereupon massacred the Moamaris with their wives and children without mercy." The rebels in their turn were not slow to make reprisals; they plundered the country on every side, and "the burning villages appeared like a wall of fire." The ordinary operations of agriculture were suspended, no harvests could be raised, and famine killed those whom the sword had spared. "The price of a katha of rice rose to one gold mohur, and men starved in crowds under the trees forsaking their wives and children."

**Gaurinath
Singh,
1780-
1795.
Moamaris
again vic-
torious.**

* The Moamaris say that 790,000 members of their sect were killed, which is, no doubt, an oriental exaggeration.

The highest Hindu castes are said to have eaten the flesh of cows, and dogs and jackals were devoured by the common people.

In 1786, the rebels under Bharat Singh inflicted a decisive defeat upon the royal troops, and took Rangpur, the capital, by storm. The king fled to Gauhati, and in his terror left even his wives behind him. His generals remained behind in Upper Assam and carried on the contest with varying success. Troops were despatched to their assistance from Manipur, but most of them were ambushed and cut up, and the survivors had no heart to carry on the struggle. The desolation of the country is thus described by the Ahom chronicler. "The Matakhs harried the temples and the idols of the gods, and put to death all the sons and daughters of our people. For a great length of time our countrymen had no home, some took shelter in Bengal, some in Burma, some in the Daffa Hills and others in the fort of the Buragohain, who was fighting with the Matakhs for years and months together." Bharat Singh ruled at Rangpur for upwards of six years and coins are extant which bear his name; but in 1792, a small British force was sent to the assistance of the Ahom king under the command of Captain Welsh. Gauhati, which had been captured by a mob of Doms under a Bairagi, was retaken, Krishna Narayan, the rebellious Raja of Mangaldai, was subdued, and in March 1794, Rangpur was re-occupied after a decisive victory over the insurgents. Captain Welsh was then recalled, but the Ahom king was able to keep his enemies in check by the help of sepoy trained on the English system.

A few months after the departure of Captain Welsh, Gaurinath died, and was succeeded by his son Kamaleswar Singh. The country was still in a state of great disorder. The Daflas, not content with harrying the villages on the north bank, crossed the Brahmaputra and attacked the royal troops near Silghat, but were repulsed with considerable loss. Even Europeans were not safe, and a Mr. Raush*, a merchant of Goalpara, who had extended his business operations to Darrang, was robbed and murdered by "naked Bengalis." These freebooters then occupied North Gauhati, but when they attempted to make good their position on the south bank, they were defeated with heavy loss by the royal troops near Pandughat. The Daflas again harried the Darrang district, and even enlisted Bengali sepoys in their service, but were ultimately conquered and dispersed. Victories were also obtained over the Moamarias and the Khamtis at the eastern end of the valley.

In 1809, Kamaleswar Singh was succeeded by his brother Chandra Kanta Singh. The Bor Phukan or viceroy of Gauhati incurred the suspicion of the Buragohain or prime minister, and fled to Calcutta and thence to Burma. At the beginning of 1816, a Burmese army crossed the Patkai and re-instated the Bor Phukan; but shortly after their withdrawal Chandra Kanta was deposed and Purandar Singh appointed in his stead. The banished monarch appealed to the Burmese, who, in 1818, returned

*This Mr. Raush was the first European to interfere in the affairs of Assam. He sent 700 burkandazes to Gaurinath's assistance, but they were cut up to a man. A mass of masonry, the size of a small cottage, covers the remains of Mr. Raush's infant children at Goalpara.

**Kamal-
eswar

-1809 A.D.**

**Final col-
lapse of the
Ahom king-
dom.**

with a large force, and replaced him on the throne. They soon, however, made it clear that they intended to retain their hold upon Assam, and in 1820, Chandra Kanta fled to Goalpara, and from British territory began a series of abortive attempts to recover his lost kingdom. The Burmese were guilty of gross atrocities during their occupation of the country. The villages were plundered and burnt, and the people were compelled to seek shelter in the jungle. Women who fell into their hands were violated, with every circumstance of brutality, and the misery of the unfortunate Assamese was extreme. Fortunately for them, causes of quarrel had by this time arisen between the British and the Burmese. In 1824, war was declared by the British Government, and a force was sent up the valley of the Brahmaputra, which occupied Rangpur in January 1825, and compelled the Burmese to retire to their own territories, while in the following year, by the treaty of Yandaboo, Assam was ceded to the East India Company.

**Ahom
administra-
tion : the
paik
system.**

The above is but a brief account of the rise and fall of the Ahoms, but their history is more intimately connected with the Sibsagar district. It now remains to consider what is known of their social institutions, and the conditions under which those subject to them passed their lives.

The most striking feature in the economy of the Ahom state, and one which (to judge from their conduct since they came under our rule) must have been extremely repugnant to the people, was the system of enforced compulsory labour. The lower orders were divided up

into groups of three or four called *gots*, each individual being styled a *poua paik*. Over every twenty *gots* was placed an officer called *bara*, over every five *baras* a *sai-kia*, and over every ten *sai-kias* a *hazarika*. In theory one *paik* from each *got* was always employed on duty with the state, and, while so engaged, was supported by the other members. The Raja and his ministers had thus at their disposal a vast army of labourers to whom they paid no wages, and for whose maintenance they did not even have to make provision. It was this system which enabled the Ahom Rajas to construct the enormous tanks and great embankments, which remain to excite the envy of a generation, which has been compelled to import from other parts of India almost all the labour required for the development of the Province and its industries. Many of the works constructed were of undoubted utility, but many, on the other hand, were chiefly intended for the glorification of their designers. Few objects are more worthy of the attention of an enlightened Government than the supply of wholesome drinking water to the people. But the huge reservoirs, constructed by the Ahom kings, were out of all proportion to the population which could by any possibility have made use of them, while the close proximity in which these enormous tanks are placed is ample evidence that practical utility was not the object of their construction. On the other hand, embankments which were thrown up along the sides of some of the rivers near the capital, protected land which has become unculturable since they have fallen into disrepair. The duty of providing the various articles

required for the use of the king and the nobility was assigned to different groups, which were gradually beginning to assume the form of functional castes. The rapidity with which these groups abandoned their special occupations, as soon as the pressure of necessity was removed, is a clear indication of the reluctance with which they must have undertaken the duties entrusted to them.*

War.

But though the common people seem to have been compelled to supply an unnecessary amount of labour in times of peace, it was when war was declared that their sufferings were most pronounced. Certain clans of *paiks* were called out, and called out, it would seem, in numbers that were in excess of the actual requirements of the case; an error which entails the most disastrous consequences when the campaign is carried on in a country where supplies are scarce and communications difficult.

According to the Ahom chronicler, nearly 40,000 troops were despatched during the reign of Rajeswar Singh to reinstate the Manipuri Raja on the *gadi*. Their guides, however, failed them, they lost their way in the Naga Hills, and about two-thirds of the soldiers perished, the mortality being chiefly due to famine and disease. The military dispositions even of Rudra Singh, one of their greatest princes, suggest a want of due deliberation in design and a feebleness and lack of method in execution.

* The system of enforced labour was no doubt unpopular, but it had much to recommend it. It taxed the people in the one commodity of which they had enough and to spare, *i.e.*, labour. It also developed them on the industrial side, and the material comfort of the Assamese would possibly have been greater at the present day if they had not all of them been allowed to devote themselves exclusively to agriculture.

In his expeditions against the Kachari and Jaintia Rajas, the Ahoms lost 3,243 persons, and the practical results obtained seem to have been insignificant. The descriptions of the campaigns against the Moamarias, given by the Ahom chroniclers, clearly show that the generals were often guilty of incompetence and cowardice, while the rank and file do not seem to have fully realized the dangers that beset a defeated army. Conditions such as these must of necessity have been disastrous to the private soldier.

The Muhammadan historians of the invasion of Mir Jumla give, however, a more favourable account of the Ahom military dispositions.* Their resources seem to have been considerable, and, in the course of the expedition, the Muhammadans captured 675 guns, one of which threw a ball three "mans" in weight, besides a large number of matchlocks and other field pieces. No less than 1,000 ships were taken, many of which could accommodate three or four score sailors; and in the naval engagement which took place above Silghat in March 1662 A.D., the Assamese are said to have brought seven or eight hundred ships into action. The Ahoms are described as strongly built, quarrelsome, blood-thirsty, and courageous, but at the same time merciless, mean, and treacherous. They were more than equal to the Muhammadans in a foot encounter, but were much afraid of cavalry. This *corps d'élite* did not, however, exceed some 20,000 men, and

the ordinary villagers, who were pressed into the service, were ready to fling away their arms and take to flight at the slightest provocation.

**Uncertainty
and arbit-
rary
character
of Govern-
ment.**

Another factor, which cannot but have re-acted unfavourably upon the common people, was the uncertainty of tenure under which both the ministers and king held office. A perusal of the Ahom chronicles leaves the reader with the impression that the ministers were continually being deprived of their portfolios and not unfrequently of life itself. Hardly less precarious was the position of the king, and in the short space of 33 years, between 1648 and 1681, no less than two monarchs were deposed, and seven came to a violent end. Good government, as we understand the term, must have been impossible under such conditions, and we may be sure that the people suffered from this constant change of rulers. Buchanan Hamilton, writing at the beginning of the nineteenth century, states that the administration of justice under Ahom rule was fairly liberal. Important trials were conducted in open court, the opinion of assessors was consulted, the evidence was recorded, and capital punishment was only inflicted under a written warrant from the king. It is true, no doubt, that few persons possessed the power of imposing the death sentence. But they were allowed to inflict punishments which the victim could hardly be expected to survive, and his position was not unlike that of the heretic delivered by the inquisition to the civil arm, with the request that "blood may not be shed."

Abundant evidence is available in the Ahom chronicles to show the arbitrary way in which the royal authority was exercised. The following instances are quoted from the reign of Pratap Singh (1611—1649 A. D.) A Kataki, or envoy charged with diplomatic relations with foreign powers, asked the Muhammadan commander on his frontier to supply him with two jars. His conduct was reported to the king, who immediately ordered him to be put to death. Another Kataki reported that he had heard from a down-country man that a Muhammadan force was advancing up the valley. The king enquired of the Kataki responsible for watching the movements of the enemy, whether this information was correct. This man declared that he was unable to obtain any confirmation of the rumour, whereupon the first Kataki was executed for presuming to meddle in matters with which he had no concern ; a proceeding which seems to have been hardly calculated to ensure the supply of timely and accurate information. Three merchants then endeavoured to establish friendly relations between the Nawab of Dacca and the Ahom king. The latter prince took umbrage at such unwarrantable interference in affairs of state, and ordered the merchants to be put to death. It subsequently appeared that the facts had not been correctly represented and the Bor Phukan and two other men responsible were promptly killed. A few years later, the king transported a large number of persons from the north to the south bank of the Brahmaputra, warning them that any one who attempted to revisit his former home would suffer the penalty of death

Instances
of this.

with all his family "even to the child in the womb." Five hundred men attempted to return, as they wished, the chronicler informs us, to rear a brood of silkworms. The king had them arrested, and 300 were put to death, the remainder escaping in the darkness of the night.

**Savage punishments :
an official
blinded
for not dis-
mounting
before his
official
superior.**

The following incident that occurred in the reign of Lakshmi Singh (1769—1780) is typical of the uncertainties of the time. One Ramnath Bhorali Borua, an officer of state, had the presumption to appear mounted in the presence of his official superior the Borborua. A complaint was promptly laid before the king, who directed that both Ramnath and his brother should be deprived of sight. The injured man was not, however, destitute of friends, and came with his complaint to the Kalita Phukan, who had his private reasons for desiring the downfall of the Borborua. The Phukan went to the king, poisoned his mind against his minister with the suggestion that a conspiracy was on foot, a suggestion which in those days must always have seemed plausible enough, and, in a short time, the heads of the haughty Borborua, his two uncles, and his brother, were rolling in the dust. It is needless to multiply instances of the savage violence of the times, but the different forms of punishment in vogue call for some remark. Where life was spared, the ears, nose, and hair were cut off, the eyes put out, or the knee pans torn from the legs, the last named penalty generally proving fatal. Persons sentenced to death were hung, impaled, hewn in pieces, crushed between two wooden cylinders like sugarcane in a mill, sawn asunder, burnt alive, fried in oil,

or, if the element of indignity was desired, shorn of their hands and feet and placed in holes, which were then utilized as latrines.

In the seventeenth century, it was no uncommon thing to compel conspirators to eat their own flesh, and more than one case is quoted, in which the father was forced to eat the liver of his son, a meal that was usually his last in this world. Punishment, too, was not restricted to the actual offender, but his wretched wife was liable to be handed over to the embraces of a Hari. Methods such as these could hardly fail to have a terrifying effect on much more hardened criminals than the Assamese.

The Ahoms, even after they became a powerful nation, seem to have adhered to a simple style of life, in which there was little of extravagance or luxury. They have left few masonry memorials of their rule; the Raja's palace is almost invariably referred to as a "planked house," and, according to Buchanan Hamilton, the king alone was allowed to erect an edifice of brick. Shoes might not be worn except by the special license of the king, bedsteads and curtains were only to be found in the houses of the rich, and all but the most important visitors to a noble's house sat on the bare ground. The account given of the Raja's palace at Gargaon by the historian of Mir Jumla's invasion is pitched in a more exalted key. Twelve thousand workmen had been engaged on its construction for a year, and the audience hall was 120 cubits long by 30 wide. "The ornaments and curiosities with which the whole woodwork of the house was filled defy all description: nowhere in the

**Social life
amongst
Ahoms.**

whole inhabited world would you find a house equal to it in strength, ornamentation, and pictures." The absence of all references to these wonders in the Ahom histories suggests, however, that the Muhammadans were anxious to magnify the power and majesty of the prince they had subdued.

The native chroniclers are naturally most concerned with the wars and religious festivals which bulked so largely in the eyes of the historians of the day, and with the rise and fall of successive families of ministers. It is only incidentally that light is thrown on the social conditions of the people. The kings seem to have indulged in frequent tours about their territories, the itinerary usually followed being Rangpur, Sonarinagar, Tengabari, Dergaon, Jaliarang, Bornagar, Bishnath, and Kaliabar. They were fond of fishing and shooting and fully appreciated the excitement to be obtained from the hunting of wild elephants. On the occasion of coronations and royal weddings, a week was generally devoted to the festivities, which seem, however, to have consisted for the most part of prolonged feasts, accompanied by much unmelodious music. Towards the end of the eighteenth century, acrobats and jugglers were imported from Bengal, who amused their royal patrons with tricks which are still shown to the tourist on the P. & O. Kamaleswar Singh visited in state the two principal *sattras* of Auniati and Dakhinpat, and was entertained with all his retinue by the gosains. The chronicler quaintly tells us that the lunch at Dakhinpat gave greater satisfaction

than the one at Auniati ; but does not say whether this was due to the superior skill of the Dakhinpatia cook or to the greater beauty of the *sattra* precincts.

The first Hindus to influence the Ahom kings were Saktists, and Pratap Singh (1611—1649) persecuted the Vaishnavites, one of whose leaders had converted his son to Hinduism. The disciples of the gosains were seized, human ordure was placed on their foreheads, and they were degraded to the sweeper caste. To be found in the possession of religious books meant death, not only to the actual owner, but to every member of his family. Even Pratap Singh's spiritual pastors were not spared, and he denounced the new religion which, in spite of the adherence of the Raja, had not been able to save from death his own beloved son. He then assembled 700 Brahmans, ostensibly to perform a festival, and, as a punishment for their incompetency, degraded them to the status of *paiks*. These persecutions were continued by Gadadhar Singh, who, in 1692, plundered the treasure houses of the Vaishnavite gosains, and cast the idols into the water. No respect was shown even to the sacred head of the Auniati *sattra*, and he was driven from his home to Tejikhat. He fared, however, better than the gosain of Dakhinpat, who had his eyes put out and his nose cut off, while many Hindu priests were put to death. A policy of extermination seems in fact to have been inaugurated, and, according to one chronicler, orders were issued for the destruction of every Hindu child regardless of sex and age. The king had large quantities of pork, beef, and

**Attitude of
Ahoms to-
wards Hin-
duism.
Savage per-
secution
of Vaishna-
vism.**

fowls, cooked by men of the Dom caste, and compelled Kewats, Koches, Doms, and Haris to partake of this unholy food.

This policy of oppression was reversed during the reign of Rudra Singh, his son, who was publicly admitted as a disciple of the Auniatigosain; and, from this time forward, the influence of the priests seems to have increased.

During the Moamaria insurrection the religious orders again fell upon evil times. The rebel king confined the persons of the four principal gosains and extorted Rs. 8,000 each from Auniati and Dakhinpat, and Rs. 4,000 each from Garamur and Kamalabari. Religion was degraded by the promulgation of an order that any person could be initiated on payment of a betel-nut, and the common people availed themselves in crowds of this indulgence. Subsequently, in the reign of Gaurinath Singh, the Moamarias attacked the Garamur *sattr*a, burned it to the ground, slew a large number of the disciples and nearly killed the gosain himself. His successor Kamaleswar Singh (1795—1809) found himself unable to pay the sepoys whose services were indispensable for the maintenance of some sort of order in the kingdom. Following the example of other monarchs, he called upon the church to supply the funds for the support of the temporal power. Contributions were levied on all the mahunts and the demands of the soldiers were satisfied.

**Laziness of
Ahom Hinduism.**

But, though converted to Hinduism, the Ahoms found the restrictions of their new religion irksome; and their

gosains, with the tact which they display towards their converts of the present day, allowed their new disciples a considerable degree of latitude. Rudra Singh, though he had been publicly admitted to the church by the Auniati gosain, feasted his followers on buffaloes and pigs on the occasion of his father's funeral ; while not only buffaloes but even cows found a place in the menu of his coronation banquet. At the time of the first Moamaria insurrection, the rebel chief made overtures to Lakshmi Singh, and offered him, apparently in good faith, a pig for supper. A present such as this clearly shows that even towards the end of the eighteenth century, the Hinduism of the Ahom kings was one of the most liberal variants of that catholic creed. Before taking any decisive step, it was the practice to refer, not only to the Brahmans and Ganaks, but also to the old Ahom priests the Deodhais and Bailongs. These venerable men were required to consult the omens, by studying the way in which a dying fowl crossed its legs ; a system of divination which is in vogue amongst many of the hill tribes of Assam to the present day. The restrictions of caste were evidently somewhat lax, as we hear that the Moamaria mahunt had an intrigue with a Hari woman, while at the beginning of the nineteenth century, the viceroy of Gauhati took a fisher girl for his mistress ; a breach of the *convenances* for which, it should be added, he was deposed.

The influence of the Muhammadans in Assam Proper was so slight that the low view they professed to take of the other sex had little or no effect upon the general

The position of women.

population. The Ahoms, like their Burmese ancestors, held their womenfolk in honour, and, even at the present day, the purdah and all that it implies is almost unknown in the country inhabited by the Assamese. The Ahom princesses seem to have taken a prominent part on ceremonial occasions, and not unfrequently exercised considerable influence on affairs of state. In the middle of the seventeenth century, two of the queens almost usurped the reins of government, and, according to the Ahom chronicler, "their words were law." When called to account by the successor of their husband, they proudly stated that they had been of great service to the king at a time when he was ignorant of the way in which he should behave, whether when "eating, drinking, sitting, sleeping, or at council." Sib Singh (1714--1744) is said to have abdicated in favour of his queens, hoping thereby to defeat a prophecy which declared that he would be deposed, and coins have been found bearing the names of four of these princesses. The mother of Lakshmi Singh dug a tank, and Gaurinath entrusted to his stepmother the control of the Khangia mel, and consulted with his mother about affairs of state. It was not, however, only the princesses of royal blood who concerned themselves with public matters. At the time of the Moamaria insurrection, one Luki Rani was sent against the rebels; and the victory over Turbuk in 1532 is partly ascribed to the courageous action of the widow of the Buragohain, who had been killed in a previous engagement by the Muham-madans. Desperate at the loss of her husband, she put

on armour and rode into the ranks of the enemy to avenge his death. No mercy was shown her and she fell, pierced with spears ; but her example emboldened the Ahoms, who at once advanced to the attack and defeated the Musalmans with great slaughter.

In estimating the effects of British rule it is necessary to form a clear idea of the state of the Province at the time when it passed into our possession, and first it must be pointed out that the British did not conquer Assam in the sense which is usually assigned to that word. The native system of government had completely broken down, the valley was in the hands of cruel and barbarous foreigners, and it was not as conquerors, but as protectors and avengers that the English came. They were certainly not inspired by any lust for land. For some time after the expulsion of the Burmese, the East India Company were doubtful whether they would retain their latest acquisition, and an attempt was made to administer the upper portion of the valley through a descendant of the Ahom kings.

**Condition
of Province
at time of
cession to
the British.**

The condition in which we found the country was lamentable in the extreme. For fully fifty years, the Province had been given over to desolation and anarchy. Life, property, honour were no longer safe, and the people in their misery had even abandoned the cultivation of the soil, on which they depended for their very livelihood. Bands of pirates used to raid up the valleys of the Dhansiri and Kakadanga, and return with their boats laden with booty, leaving ruin, death, and desolation in their wake. The hill tribes were no longer

kept in order, and the Daflas descended and harried the submontane tracts, and even extended their depredations to the south of the Brahmaputra. The treatment meted out to the unfortunate villagers can be judged from the protest made by the hillmen to Rajeswar Singh shortly before the collapse of the Ahom government, when they begged him "not to pull out the bones from the mouth of dogs." Buchanan Hamilton, writing in 1808 A. D., states that north of the Brahmaputra "there is no form of justice. Each power sends a force which takes as much as possible from the cultivator."

**Native
testimony
on this
point.**

The memories of this miserable time survived long after it had passed away. In 1853, an Assamese gentleman, Srijut Ananda Ram Dhekial Phukan, wrote as follows to Mr. Moffatt Mills.

"Our countrymen hailed the day on which British supremacy was proclaimed in the Province of Assam, and entertained sanguine expectations of peace and happiness from the rule of Britain. For several years antecedent to the annexation, the Province groaned under the oppression and lawless tyranny of the Burmese, whose barbarous and inhuman policy depopulated the country, and destroyed more than one half of the population, which had already been thinned by intestine commotions and repeated civil wars. We cannot but acknowledge, with feelings of gratitude, that the expectations which the Assamese had formed of the happy and beneficial results of the Government of England, have, in a great measure, been fulfilled; and the people of Assam have now acquired a degree of confidence in the safety of their lives and property which they never had the happiness of feeling for ages past."

Whatever errors have been committed by the British Government, and it is too much to hope that no mistakes of policy have been made during an administration of

nearly eighty years, there can be no question that the introduction of a settled form of government has been of the greatest benefit to the immense mass of the people to whom it has been extended.

The history of the district under British rule has been very uneventful, and, before referring to such incidents as have occurred, it will be desirable to touch briefly on our dealings with the various tribes inhabiting the hills that bound it on the north. The history of these tribes down to the year 1884 will be found in fuller detail in the North-East Frontier of Bengal by Sir Alexander Mackenzie.

The north-
ern frontier
—Bhutan.

On the north-west frontier of the district lie two duars, Khaling and Buriguma, to which claims were laid by the Bhutias at the time when we took over the administration of the Province. These claims dated from the time of the Ahom Rajas. Originally the boundary of this debatable land lay at some distance to the north of the Gohain Kamala Ali, but the Bhutias took advantage of the weakness of the Ahom government, and occupied territory even to the south of that great road. In 1810, they were driven back, and compelled to pay Rs.20,000 worth of goods as compensation. But during the troublous times that followed they advanced again, and, in 1835, were in occupation of villages south of the Gohain Kamala Ali*.

A curious system of dual control was inherited from the days of native rule, under which the Assam Government occupied the two duars from July to November,

* Lieutenant Mathie's report, para 44.

and received from the Bhutias as rent for this tract and for the five duars in North Kamrup a certain quantity of yaks' tails, ponies, musk, gold, etc., of an estimated value of Rs. 4,785 per annum. This arrangement, it need hardly be said, proved most unsatisfactory. The Bhutias oppressed our villagers, and the duars acted as an Alsatia for all the criminals of the district, who could easily retire into the hills during the four months of our occupation. In 1841, the seven duars were definitely annexed, and Rs.10,000 per annum was offered to the Bhutias as compensation for the loss of such rights as they possessed. The conduct of the hillmen still continued to give ground for just complaint, and an expedition had at last to be despatched into their territory. In 1865, on the conclusion of this war, the whole of the Assam and Bengal duars were annexed, but compensation, which now amounts to Rs. 50,000 per annum, is paid to the hillmen, so long as they remain of good behaviour.

Towang.

East of Bhutan, is the province of Towang which owes direct allegiance to the Government of Lhasa. The Kariapara duar, which lies at the foot of this section of the Himalayas, was annexed shortly after our occupation of Assam, and in 1844 the local officials, who are known as Gelengs, agreed to accept Rs. 5,000 per annum as a perpetual quit rent. In 1852, one of these Gelengs asserted his independence, and when troops were sent from Lhasa to arrest him, fled to British territory. The Tibetans demanded his surrender, which was refused, and four hundred men

with two guns were sent up to the frontier to oppose the threatened raid. This in itself was enough to damp the ardour of the hillmen, and it was agreed that the Geleng should be allowed to live in British territory south of the Brahmaputra. In 1861, he returned to the hills, but again embroiled himself with the authorities, and for a second time fled to the plains for refuge. He was allowed to remain in the neighbourhood of the frontier, and, in 1864, was murdered by a party of his enemies. No very decided action was taken on this violation of British territory, as the local officials were of opinion that the stoppage of the yearly payments might only lead to further raids. Since that date no trouble has been experienced on this section of the frontier.

The Charduar Bhutias, who lie further to the east, are a peaceful tribe who have given comparatively little trouble. In 1826, the compensation to be paid to them was fixed at Rs. 2,526, but thirteen years later it was reduced to Rs. 1,740 to punish them for the murder of a British subject. Their country lies between the Rota and the Gabharu rivers. Their neighbours on the east are the Thebengia Bhutias, a small and peaceful clan who receive Rs. 146 per annum.

Between the Bhareli river and the Bhutias live the Akas, a small but warlike tribe, who more than once have caused embarrassment to the Government. They are divided into two sections, the Hazarikhoas, or the people supported by a thousand groups of raiyats, and the Kapaschors or "thieves who lurk in the cotton

fields"; and, in the time of the Assam Rajas, they regularly harried the inhabitants of the plains. For many years the chief of the Kapaschor tribe, Tagi Raja, violated our boundaries, and, in 1829, he was captured and lodged in the Gauhati jail. In 1832, he was released, but immediately resumed his attacks, and, in 1835, massacred all the inhabitants of the police outpost and British village of Balipara. Six years later he surrendered, and an agreement was made by which both sections of the tribe received a yearly allowance, subsequently increased to Rs.668, in consideration of good conduct. In 1883, Medhi, the Kapaschor chief, detained a mauzadar who had visited his village, while his brother carried off from Balipara a clerk and ranger in the employ of the Forest Department. A punitive expedition was despatched which occupied their territory and recovered the captives, with the exception of the mauzadar who had already died. Since that date they have given little trouble, but in 1900, a party of armed Akas forcibly entered the shop of a trader at Balipara, to exact the amount which they alleged was due to them for rubber taken from their hills. A fine was imposed on the tribe, but, in order to minimize the chances of friction, it was decided to discontinue the practice under which coolies had been sent into the hills to tap rubber, and to leave the hillmen to bring down this product themselves.

The Daflas' relation with Ahoms.

The hills which stretch from the Bhareli river to the Sumdiri north of Lakhimpur are inhabited by the Daflas, a people, like their neighbours on the east and west, of Thibeto-Burman origin. In the days of Rudra Singh, they

seem to have owned allegiance to the Ahom Government, and both they and the Miris are said to have served in the expedition sent against the Kachari and Jaintia kings. Rudra Singh's son and successor, Sib Singh, constructed the Daflagarh to check their raids, and a later prince, Rajeswar Singh (1751—1769), seems to have experienced the same difficulties in dealing with them and to have adopted much the same remedies as successive Lieutenant-Governors and Chief Commissioners. The Daflas carried off one Bihoal Dom and his family, whereupon the king closed the duars and established a blockade. A deputation of hillmen then waited upon him, in the hope of coming to some agreement, but he foolishly broke faith and detained them as hostages at Kaliabar. The Daflas promptly retaliated by raiding again and carrying off more captives. An exchange of prisoners was ultimately arranged, and the experiment was then tried of giving each Dafla house a *pura* of rice and four *pans* of cowries in order to encourage them to be of good behaviour. In the period of anarchy that followed the accession of Lakshmi Singh, the hillmen threw off all semblance of control, and even ventured to cross the Brahmaputra in search of booty. It was only natural that they should resist the efforts of the British officers to reduce them again to order, and it was not till 1852 that their claims to collect their dues from the submontane villages were commuted for a money payment of Rs. 2,543.*

* Lieutenant Mathie (para. 77) states that the right to levy blackmail was conceded to the Daflas on the understanding that they in return would serve in the army of the Ahom Raja when called upon to do so. This being so their title to *pura* lapsed on our annexation of Assam, as we had no desire for such auxiliaries.

**Early raids
and ex-
pedition of
1874-75.**

Like the other Himalayan tribes, their tempers are cast in a milder mould than those of the savages who occupy the Assam Range, and in their raids upon the plains they have generally contented themselves with taking prisoners, and have stopped short at murder. In 1835, they carried off a few persons from Balipara, who shortly afterwards were rescued by a small expeditionary force. Similar disturbances occurred in 1870 and 1872. In the latter year the village of Amtolla, near Gohpur, which was inhabited by Daflas who had settled in the plains, was raided by the hillmen, and forty-four persons were carried off, and two, who resisted, murdered. The hillmen had been troubled by an epidemic, which they alleged had been introduced from the plains, and called upon the plains Daflas to compensate them for the loss of life incurred. On their declining to accede to this proposal, the hillmen made good their demands by force. A blockade was at first instituted, but on this proving ineffectual, an expedition was despatched into the hills in 1874-75, and the captives were recovered.

**Misconduct
since 1896.**

For more than 20 years after this demonstration of our power the tribe continued to be of good behaviour ; but in 1896 they detained a party of coolies, who had absconded from the Dikrai tea estate and wandered into the hills. The payment of *posa* was stopped, but the last of the coolies was not recovered till 1900. In 1899, they carried off four persons and three guns from an elephant camp near the frontier, not far from the Rangaghor garden in order to invite attention to their claims against a firm of Kaiyas for the price of rubber

tapped in their territory. The prisoners and most of the property were recovered, the Kaiyas were required to pay what was due, and the Daflas were fined for their violation of our territory, while a liberal deduction was made from the sum paid by the Kaiyas on account of the value of such property as was missing. Four years later the hillmen again carried off four men and seven guns from an elephant stockade in the same locality, as they were discontented with the distribution of a sum of money paid for the right of catching elephants in their territory. The captives were returned and the guns restored, but the other property was not forthcoming. The value of these articles was, accordingly, deducted from the *Dafla posa* and paid over to the owner.

Darrang was separated from Lower Assam and erected into a separate district in 1833, and its history since that date has been uneventful. The headquarters were first established at Mangaldai, but in 1835, were removed to Tezpur, which is situated in the centre of the district and is nearer to the Dafla tribes, who at that time were a source of some anxiety to the Government. For many years the station was considered most unhealthy, and in the eleven years between 1842 and 1853 no less than five European officers died of diseases contracted while they were resident at Tezpur. This unhealthiness is unfortunately not confined to the headquarters town, but seems to be a characteristic of the district as a whole. The development of Darrang has been hampered by the stagnation of the population. In 1853, Mr. Mills stated that the people had been supposed to be decreasing in

**History of
the district
under British
Administration.**

numbers during the four preceding years ; and in the thirty years between 1842 and 1872 the total censused increase was only 27 per cent, a large part of which was, doubtless, due to the superior accuracy of the later enumeration. In the twenty years ending with 1901 the indigenous population decreased considerably in numbers, and, had it not been for the existence of a flourishing tea industry, the district would still have been in a very undeveloped state. The administration of Darrang does not seem to have been hampered by the want of officers. In 1841, a junior assistant, a sub-assistant, a sadr amin and two munsifs were stationed in the district,* and a similar number of officers were employed on judicial work in 1853. In those days there was little of hurry or bustle in Assam, and the administration of justice, if sure, was distinctly slow. Matters seem to have been particularly bad in the court of the joint magistrate, but that officer, when called on for an explanation, protested with some show of indignation that the detention of witnesses seldom exceeded eight days. As a matter of fact, it appears from the returns that, in 1852, no less than 36 unfortunate persons were detained from 16 to 22 days before they could get their evidence recorded !

The Patharughat riots in 1894.

Only once during the past fifty years has the internal peace of the district been seriously disturbed. The population of the Patharughat tahsil is largely composed of Muhammadans, who have more than once shown themselves impatient of control. When the revenue was raised in 1868, the villagers assembled in an unruly mob,

* Robinson's Assam, p. 290.

and besieged the Deputy Commissioner, the Subdivisional Officer and the District Superintendent of Police in the rest-house ; but no extreme measures were resorted to on either side. In January 1894, after the reassessment of the Assam Valley, the villagers in this portion of the district declined to pay their revenue, and collected in tumultuous crowds with the evident intention of overawing the authorities. The Deputy Commissioner accordingly proceeded to Patharughat with twelve military policemen and nineteen members of the armed civil police, in order to lend the weight of his authority to the local revenue officials, who were quite unable to collect the land tax. The people assembled in a dense crowd in the compound of the inspection bungalow, and as they obstinately declined to move they had to be ejected by the police. About half an hour afterwards the mob returned armed with sticks and clods, and the police again advanced and drove them down a road on to an open plain. Here the mob rallied and began to pelt the police with clods and sticks, and gradually to hem them in. The police were compelled to open fire, but even then the rioters did not give way, and the police retired slowly firing all the time, with the crowd continually pressing in upon them. A final volley was then discharged and the police charged the rioters who at last began to yield, though they reformed a little distance off, and the Deputy Commissioner was compelled to retire to the inspection bungalow. Altogether fifteen men were killed and thirty-seven wounded in this unfortunate affair.

Bamuni
hill.**

The most interesting archæological remains in Dar-rang are the ruins of the fine stone temples on the Bamuni hill a little to the east of Tezpur, and the carved pillars, entablatures, and friezes which are still to be seen lying near the cutchery, and are probably the remains of the glories of Durjaya. The Bamuni temples are thus described by Captain Westmacott :—

“The first temple I examined appeared to have faced the north, and to have been provided with a portico supported on three columns of sixteen sides; each shaft, not including the plinth—a pedestal which stands four feet above the ground—measured eight feet high, and five and a half in girth, and was wrought from a single block of fine granite. The shafts have sculptured capitals, while the surbases take the form of an octagon, and the plinths are circular at top, and spread into four feet, making a sort of cross that measured four and three-quarter feet each way. These gigantic stones, with the fragments of a fourth, each hewn from a single block fourteen feet long, and cut into five irregular sides, of which the total showed a circumference of eight feet, seemed to have formed the entablature of the entrance porch, which I judged to have been fifty-six feet long. The frieze has three tiers of carving in basso relievo, representing scrolls of flowers. The apertures, in which iron rivets were introduced, can still be distinctly traced, and it is evident that no cement was employed to unite the materials. The other ruins were too much shattered and dispersed to enable me to conjecture the form of the temple. From a great portion of the surrounding works being in an unfinished state, it affords the presumption that the architect must have met with some unlooked-for interruption; and that this, and the other buildings, were overthrown at the same period by some hostile power opposed to the propagation of Hinduism, assisted perhaps, subsequently, by a convulsion of nature. Had time been the sole agent in overthrowing these structures, it is but fair to suppose, from the great solidity of the materials, that the ruin would have been less complete, and that the fragments would have lain in a narrower compass. The destruction of the temples at this place is ascribed by some to Kala Pahar, the general of Sulaiman, King of Bengal, at whose door the Assamese lay all the sacrilege and mischief that has been consummated in the Province.

From their massive proportions, and the carving and ornaments being so much worn by time and exposure, the fanes are evidently the work of a remote era ; I sought in vain for an inscription, and neither the priests of the district, nor the ancient families whom I consulted, could assist my researches, or point, with any approximation to accuracy, to the date of their origin.

Unconnected with the first temple, and retired some yards deeper in the wood, or rather grove of trees which was in likelihood planted by the priests who ministered at the temples, I found the ruins of six or seven other enormous structures of granite, broken into thousands of fragments, and dispersed over the ground in the same extraordinary manner as those already described. Altars of gigantic proportions were among the most remarkable objects ; one of these, measuring upwards of six feet each way and eighteen inches thick, was elevated from seven to eight feet above the level of the plain, and approached on each side by layers of stone disposed in the form of steps. It was hewn from a single block of granite ; underneath was a sort of cavern ; the top had holes for iron links, and a receptacle to receive flowers and water to bedew the Nandi, or sacred bull of Siva, who was placed, my informants imagined, on the brink of the reservoir. Six or eight other altars, one of them making a square of forty-six feet and eighteen inches thick, are to be seen in other parts of the ruins ; and several square blocks, each measuring from twenty to thirty feet, concave in the centre, and sculptured in imitation of circlets of flowers, must have formed the *bedi* or altar-piece of Siva, as there is a seat for the *linga*, or symbol of the deity, in the middle of each.

The ruins are partly encompassed by walls, which extend in so many directions that it is scarcely possible to guess at the purpose of the architect. The walls have their foundations laid very deep in the earth. They are in an unfinished state, and were evidently constructed at a period long subsequent to the temples ; they are built of massive blocks of cut stone, sometimes disposed in a double row, and exhibit a good deal of carving. The stones are of various shapes, and rise three or four feet from the ground, and were all intended to be united by bands of iron. The entrance of the principal enclosures appears to have been from the south, where lie some pedestals and three or four wedge-shaped stones, about five feet long and three broad, of a flattened pentagonal shape, intended, I presume, to have formed the *voussoirs* of an arch ; the middle of the key-stone is decorated with a handsome diadem or plumed tiara.

A little to the north of the wood, buried in a forest of reeds, I discovered a very interesting fragment: this was a solid mass of granite, of a much finer grain than the kind used in the temples measuring ten and a half feet in length, two and three quarters in breadth, and two in depth. On this were sculptured, in very high relief, eighteen figures of gods, partially mutilated, but generally in a good state of preservation.

Near the images are nine square pedestals of large dimensions, with three carved feet, which must have been intended to give support to as many columns; of these several have almost disappeared in the earth, and it is probable that others are lost altogether. It shows, at all events, that the design of the temple must have been projected on a larger scale. The pedestals do not appear to have been moved from the spot where they were originally carved; and they are so little impaired by time and exposure to the elements that I feel assured they are of modern date compared with the buildings in the plantations and on the adjacent plain. They were, indeed, as fresh to look at as if but recently executed by the mason's chisel. Vast fragments of the epistylum and frieze, carved with beaded drapery, also lie half-buried in the soil.

In the south-west angle of the Pura plains, there is another curious remnant of sculpture, also wrought from a single mass of granite, upwards of ten feet long and two and a half thick at the middle. It appears to have formed the side of a gate, and has a band of carving three inches broad on each side, showing in relief, elephants, tigers, deer, rams, cattle, and swans, encircled by scrolls of flowers.

No quarries were discovered to indicate that the stones were disembowelled from the hills; but quantities of chips were seen in places; and once I came upon pillars and altars in an unfinished state, shaped from blocks of granite, on the surface of the earth. There seems no question that all the material employed on the fabrics was similarly procured from the masses of rock that cover the hills in great abundance. Once or twice only I fell in with well-burnt bricks; they were smooth and thin, of rather a large size, but not badly shaped. Great part of these extensive ruins are buried or have sunk into the earth, and they cover altogether about four or five acres of land.

I have been thus particular in noticing them, because there are not, so far as I know, any architectural remains in Assam that can

challenge a comparison with them for durability of material and magnitude of design ; and it is certain, from the prodigious number of ruinous and deserted temples, all of which appear to be dedicated to Siva, lying within the circuit of a few miles of Pura (I discovered twelve or fifteen in as many days on the hills and high lands at their feet), that this spot must have been the capital of a sovereign prince, or a principal seat of the Hindu religion enjoying a large share of prosperity at some remote period."

One of the largest temples in Darrang is the one sacred to Basudeb, which is situated near the Kharoi *bil* in the Kalabari mauza. It was built in 1758 A. D. and consists of a dome 26 feet in diameter at the base and 62 feet high, and a nave 28 feet long and 15 feet broad. The walls are about four feet thick and are made of thin flat bricks with a good glaze, but the whole structure has been allowed to fall into disrepair, and the idol has been removed to a shed close by. The temple is the property of the Dakhinpat gosain, and steps are now being taken to ensure that the necessary repairs are executed.

The Kalabari temple.

There is a similar temple on the southern slopes of the Singri hill in which there is a well, which is connected by a subterranean conduit with the Brahmaputra, so that the water in the well rises and falls with the water in the river. An image of Siva is supposed to be reposing at the bottom of the well, and the offerings of worshippers are accordingly thrown into the water. The date of the construction of the temple is not known. According to one account it was founded by Singri Rishi in the heroic age. Another legend has it that it was erected to the memory of one Vishnu Puri Swami, and that the Bhutias pay tribute to the temple at the present day as a punishment for having stolen a stone that had been placed upon his grave.

The Singri temple.

This of course is legend and nothing more, but it is an actual fact that this temple, like the one at Hajo in Kamrup, is visited by considerable numbers of Bhutias in the cold weather.

Temples at Bishnath. Bishnath was a great religious centre after the conversion of the Ahom kings to Hinduism, and at one time there were several temples there, which at the present day have fallen into ruins. The Bishnath temple was built by Gadadhar Singh in 1685 A. D., and a copper plate is still extant which records the grant of four Brahman and forty Sudra *paiks*, eight dancing girls, and twenty *puras* of land with various ornaments to the idol. In 1815, a further grant of twenty-four *puras* of land was made by Chandra Kanta Singh; but the temple was long ago swept away by the Brahmaputra, and even the lingam, which is carved on a big rock, is only visible in the dry season. About 1730 A.D., Sib Singh constructed at Bishnath the Sivanath moth, a temple about 40 feet high, which has now fallen into disrepair; but this is not so fine a specimen of Ahom architecture as the Bordol temple which was erected by Gaurinath Singh about 1790 A. D. There are two small temples standing on rocks in the river, and four other places sacred to Basudeb, Kamaleswar; Muktinath, and Surjya Madhub; but worship is here conducted in a miserable thatched hut, and from an archæological point of view they possess but little interest. Local tradition avers that Sati's breast fell near Bishnath when her body was hewn in pieces by Vishnu, and though this tradition is not supported by the *Yogini Tantra*, which is the great authority on the subject, it

possibly accounts for the unusual degree of reverence with which Bishnath was regarded by the Ahom kings.

There are two small temples in the Borbhegia mauza, Other temples. one the Nandikeswar, about three miles east of the Bhareli, and the other the Nagsankar, about six miles distant from that river. They are said to have been built by the kings of Pratappur, but very little is known about their origin. The Mahabhàirab temple is a small brick building of recent date, about one mile due north of the Tezpur catchery. It contains a large lingum which was apparently originally enshrined in a stone temple dating from the time of the Pala kings. The Haleswar temple is said to have been built under the orders of Rudra Singh, at the spot where a lingum was discovered by a man when ploughing (*hal*), and owes its name to that circumstance. A complete list of the temples in the district is appended to the following chapter.

Reference has been already made to the remains of the The Pratappgarh. earthworks at Pratappgarh. The embankment, which is still about 20 feet in width, runs for more than two miles north of the trunk road, and then meets the Majuligarh which is continued right up to the foot of the hills.

The fortress at Bhalukpang is situated on the top of Bhalukpang. a hill, 300 feet high, near the point where the Bhareli issues from the Aka Hills. Three sides of the hill are surrounded by a brick wall, and, on the fourth, the fortifications are carried across to an adjoining hillock which slopes gradually to the plain. Hewn stones and the remains of plinths are to be seen within the ramparts,

and a steep pathway paved with stone runs up the eastern face of the hill.

**The Burai
Walls.**

On either side of the Burai river, just beyond the inner line, there are two masonry walls, one of which is about 300 yards long and 10 feet high. These walls, with a sacred cave in the vicinity, were described by Colonel Dalton in the Calcutta Review and recently by Mr. W. N. Edwards*. From their position it appears that they were erected to protect their occupants from invasion from the south.

Tanks.

The only other memorials of a bygone age are the tanks which are to be found in every portion of the district, many of them in places which are now completely destitute of inhabitants. They thus suggest, what on *a priori* grounds seems only probable, that some centuries ago the population of Darrang was greater than it is at the present day.

* *Vide J. A. S. B., Vol. LXXIII, Pt. I, No. 3, 1904.*

CHRONOLOGICAL TABLE.

AHOM KINGS.	
A. D.	
1228	Sukapha.
1268	Sutenpha.
1281	gubinpha.
1293	Sukangpha.
1332	Sukampha.
1364	Sutupha—treacherously killed by Chutiyas at a regatta held on the Safrai river to celebrate a cessation of hostilities between the two tribes.
1376—1380 Interregnum.	
1380	Sukemthi—a weak and tyrannical prince, assassinated by his ministers.
1389—1398 Interregnum.	
1398	Sudangpha.
1407	Siyangpha.
1422	Suphukph
1439	Susingpha—defeats Nagas.
1488	Suhangpha—defeated by Kacharis in 1490 and murdered by a convict.
1493	Supimpha—a cruel prince, assassinated by his ministers.
1497	Suhunmung <i>alias</i> Sarga Narayan or Dihingia Raja—conquers Chutiyas and annexes their kingdom, 1523. Repulses two Muhammadan invasions, the second being that under Turbuk in 1532 who was routed near Bhareli river. Kills Kachari king and sacks Dimsapur his capital in 1536. Assassinated 1539.
1539	Sukhenmung—built Gargaon (Nazira)
1532	Sukampha.
1611	Suchengpha or Pratap Singh—assists Balli Narayan against Mussalmans—besieges Hajo but is driven back. Barnadi accepted as frontier between Muhammadans and Ahoms in 1637.

MUHAMMADAN INVASION.	
A. D.	
1204	Baktiar Khilji invades Assam.
1220	Ghiyasud din Bahadur Shah—advances to Sadilya but is defeated.
1266	Iktiyarud-din Yuzbak Tughril Khan—invades the Brahmaputra Valley, but is ultimately defeated.
1337	Muhammed Shah—sends a force "of 100,000 horsemen" into Assam, all of whom perish.

KOCH KINGS.	
1509—1534	Viewa Singh—founds Koch kingdom, advances against Ahoms but was apparently defeated.
1534—1584	Nar Narayan—conquers Ahoms and occupies Gargaon, circa 1563 A. D. Subdues Rajas of Cachar, Jaintia, Manipur, Tippera and Sylhet. Kala Fabar invades Assam in 1553 and destroys temples at Kamakhya and Hajo.
1581—1593	Raghu Rai—obtains share of Koch kingdom east of Sankosh.
1593-1614	Parikshit—builds North Gauhati, quarrels with his cousin Lakshmi Narayan who calls in Muhammadans to his aid.
1614—1637	Balli Narayan—invokes aid of Ahoms against Muhammadans. From this date the Koch kings cease to be of any political importance.

CHRONOLOGICAL TABLE—(continued).**AHOM KINGS.**

1649	Surumpba—deposed.
1652	Suchingpha—deposed.
1654	Sutumla or Jaiyadwaj Singh— Ahoms occupy Goalpara 1653. Driven back by Mir Jumla who enters Gargaon 1661.
1663	Chakradwaj—Ahoms r e o c c u p y Gauhati in 1667.
1670	Adayaditya Singh—assassinated.
1672	Suklumpha—poisoned. Musalmans reoccupy Gauhati.
1674	Suhung—assassinated.
1674	Teenkungiya—assassinated.
1674	Suhungpha—blinded and murdered.
1677	Sudinpha—assassinated.
1679	Sulekpha (Lora Raja)—assassinated.
1681	Gadadhar Singh—Ahoms recover possession of Gauhati.
1695	Rudra Singh—founds Rangpur, defeats Kachari and Jaintia Rajas, publicly adopts Hinduism as his religion. This period represents the height of the Ahom power. Dies at Gauhati.
1714	Sib Singh—a weak prince who re- signed in favour of his wives. Excavated tank at Sibesar.
1744	Framatta Singh.
1751	Rajeswar Singh—decline of Ahom power.
1769	Lakshmi Singh—outbreak of Mo- maria rebellion—king deposed for a time, but subsequently reinstated.
1780	Gaurinath Singh—driven to Gau- hati by Moemarias. Reinstated by Captain Welsh in 1792, who is, however, recalled in 1794.
	Krishna Narayan, Darrang Raja— asserts his independence in 1792, but is defeated by Captain Welsh.
1798	Kamaleswar Singh—deposes Krish- na Narayan.

CHRONOLOGICAL TABLE—(concluded).**AHOM KINGS.**

1809	Chandra Kanta Singh—Burmese are invited into Assam by Bor Phukan. Deposed 1816.
1816	Purandar Singh—Burmese again enter Assam. Deposed 1818.
1818	Chandra Kanta Singh—Burmese decline to leave—Chandra Kanta driven from Assam in 1820.
1824	War declared between British and Burmese Governments.
1825	Rangpur taken.
1826	Treaty of Yandaboo by which Assam was ceded to the East India Company.

CHAPTER III. POPULATION.

Density of population—Town and villages—Growth of population—Variations by subdivisions—Migration—Sex and marriage—Infirmities—Language—Castes—Religion—Hindu sects—Gosains and sattras—Muhammadanism—Animism—Minor religions—Christianity—Occupations—Marriage customs—Amusements and festivals.

**Density of
population.**

The district covers an area of 3,418 square miles and is comparatively sparsely peopled, except in the central portion of Mangaldai. Roughly speaking, this tract is included in the tahsils of Kalaigaon and Patharughat, which, in 1901, covered an area of 422 square miles and supported a population of 209 to the square mile, and in the Mangaldai tahsil, which had a density of 162 to the square mile. Population is also fairly dense in the belt of land which runs northward from Tezpur town towards the hills and is included in the Tezpur tahsil and the Bali-para mauza. East and west of Tezpur the submontane tracts are very sparsely peopled ; and the Gohpur mauza, which lies in the east of the district and covered an area of 508 square miles, had only 49 persons to the square mile in 1901. There are also wide stretches of waste land between the Gabharu river and Odalguri. The Bargaon, Orang, Dalgaon, Rangapani, and Sonaigaon mauzas, which are included in this tract, had a population, in 1901, of only 34 persons to the square mile, over

a total area of 900 square miles. Much of this waste land is undoubtedly well adapted for cultivation, and it is allowed to remain under jungle, not because it is intrinsically undesirable, but because there is no one in the district to till it. The area and population of each tahsil and mauza in 1901 will be found in Table III.

Darrang contains one town, Tezpur, which in 1901, had a population of 5,047 souls, and 1,275 villages. Town and villages. The villages are not, however, well defined units, clusters of huts which stand out clearly in the centre of the fields tilled by their inhabitants. Rice, the staple crop, is grown in wide plains, dotted over with clumps of bamboos and fruit trees in which are buried the houses of the cultivators. It is groves and not villages that the traveller sees when riding through the more densely populated portions of the district, and not a house can usually be discerned till he has penetrated this jungle of plantains, betelnut trees, and bamboos. There is generally no dearth of building sites, there are no communal lands, and there is nothing to keep the population together. Except on the grassy plains inhabited by the Kacharis, it is difficult to tell where one village ends and another begins, or to which of the larger clumps of trees should be assigned the smaller clumps which are freely dotted about amongst the rice fields. The result is that the statistics of villages are of little practical importance; but, taking them for what they are worth, it appears that villages run small, as, in 1901, nearly two-thirds of the population of the district were living in hamlets with less than 500 inhabitants.

**Growth of
population.**

The earliest estimate of the population was made in 1835, and was evidently much below the mark. The Bhutan Duars were excluded from the calculation, and in the remainder of the district there were said to be 89,519 persons. In 1841-42, a more accurate enumeration showed 185,569 people living within the district as at present constituted, but the first regular census was not taken till 1872.

		Population.	Percentage of increase in decade.
1872	...	235,720	
1881	...	273,012	+ 16·8
1891	...	307,440	+ 12·6
1901	...	337,313	+ 9·7

The abstract in the margin shows the population recorded at the last four enumerations and the percentage of increase in each decade.

At first sight it would appear that the people were growing in numbers in a satisfactory manner, but further investigation shows that this is not the case. The whole of the increase is due to immigration, and not to, what is generally expected, an excess of births over deaths. There was no increase in the number of persons born and censused in the district between 1881 and 1891, and, as the latter enumeration was the more accurate of the two, it is only reasonable to suppose that they actually declined in numbers. The results disclosed by the last census were even more unsatisfactory. The decrease in the indigenous population was no less than 8 per cent, and the total population enumerated outside the tea gardens was more than 2,000 less than it had been ten years before.

These unsatisfactory results are partly due to the spread of *kala-azar*, an acute and very contagious form of fever, which is described at greater length in the section dealing with the medical aspects of the district. But apart from special causes of this nature, it seems possible that there may be something connected with the tract of country lying between the Brahmaputra and the Himalayas which is unfavourable to the rapid growth of population. The census of 1872 was non-synchronous, and accurate statistics are only available for the purposes of comparison for the last twenty years. During this period there has been no material growth in Goalpara, Kamrup, or Darrang, but it is possible that this is due to the existence of the special cause to which reference has been already made, *i. e.*, *kala-azar*. It is, however, a significant fact that the population of the Kuch Bihar State, which is not known to have suffered from this fever, steadily decreased between 1881 and 1901. Again, in the neighbouring district of Rangpur, the population in 1901 was only a few hundreds more than that returned in 1872; and, as there was a great improvement in the accuracy of the enumeration, it is evident that during these twenty-nine years the total population declined in numbers.

Are the
Himalayan
plains
inimical to
human life?

There is nothing in the Assam terai to suggest to the casual visitor that it is specially unhealthy. The land lies high, is fairly free from jungle, and rolls in grassy plains, covered with short springy turf, to the foot of the Himalayas. It is, however, an undoubted fact that the detachment of sepoy who used to garrison the fort at

Odalguri, returned each year to their regiment broken in health and saturated with malaria. Yet they were only stationed at this outpost in the cold weather, and, at that season of the year, Odalguri fort is, to all outward seeming, far from an unhealthy place of residence. The cause of the unhealthiness of the locality is most obscure. Possibly it may be, in some way, connected with the high subsoil level of the water, due to the disappearance of some of the rivers into the soil in the northern portion of the plain, a phenomenon which is common to all the Bhutan Duars. This stagnation of the population is, moreover, not a thing of yesterday. In 1853, Mr. Moffatt Mills was informed by the local officers that the population had been decreasing during the four preceding years, and severe charges were brought by the civil surgeon against the salubrity of Tezpur, the headquarters station.* He pointed out that during the preceding eleven years no less than five European officers had died of diseases contracted while they were in charge of that town; but, in common fairness, it must be admitted that this exceptional mortality was in all probability largely due to special disadvantages of site, which have since been partially remedied.

Variation
by sub-
divisions.

	Population.		Percentage variation.	
	1901.	1891-1901.	1881-1891.	
Tezpur ...	166,733	+39.5	+37.5	
Mangaldai ...	170,680	-9.2	+0.08	

The abstract in the margin shows the distribution of the population by subdivisions and the percentage of variation that took place in the last two decades.

* Report on the Province of Assam by A. J. Moffatt Mills. Calcutta, 1854. 'Darrang.'

The contrast between the eastern and western portions of the district is most marked, as, while the population of Tezpur was advancing by leaps and bounds, that of Mangaldai was at first stationary and then positively receding. There is, however, a most complete difference between the conditions prevailing in the two subdivisions. In 1881, Tezpur was very sparsely peopled, there being only 42 persons to the square mile, whereas in Mangaldai there were 146, and most of the good rice land south of the Kachari mauzas was already taken up. In the latter subdivision the general health has been extremely bad, the soil has not proved very suitable for the cultivation of tea, and the overflow from the plantations has not been enough to make good the deficiencies occurring in the ranks of the village population. In Tezpur there are numerous flourishing tea gardens, to which large quantities of coolies are imported every year. Many of these persons save money and settle down as independent cultivators. The extent to which this process of colonization has been carried on can be judged from the fact that, in 1901, it was found that no less than 13 per cent. of the villagers of Tezpur had been born in the Provinces and States which supply Assam with its garden coolies. *Kala-azar* has appeared near Bishnath and Tezpur town, but the mortality from this disease in the *sadr* subdivision has been insignificant in comparison with the havoc wrought in Mangaldai, and the general condition of this portion of the district may be considered to be distinctly satisfactory. In Tezpur, there was, in 1901, in each tahsil and mauza, a

large increase of population, which was most pronounced in Gohpur and Bargaon, two extensive tracts at the eastern and western ends of the subdivision, where there is a great quantity of excellent land available for settlement. On the other hand, Sekhar and Jhaprabari, two mauzas in the north-west corner of Mangaldai, were the only portions of that subdivision where there was any appreciable increase of population, and this was almost entirely due to the importation of garden coolies. Everywhere else there was a decrease, which was most pronounced in the Patharughat and Mangaldai tahsils in the south-west corner, and in the Harisinga, Ambagaon, Sonaigaon, and Rangapani mauzas, which lie between Bengbari and Orang at the foot of the Bhutan Hills. Further details with regard to the density and variation in the population of each tahsil and mauza in the district will be found in Table III.

Migration. Reference has been already made to the extent to which Darrang has relied on immigration to keep up its population, and the statistics of birthplace show that, in 1901, more than one-fourth of the persons censused in the district were foreigners who had been born outside the boundaries of the Province. In Tezpur, these foreigners formed nearly 42 per cent of the total population, but in Mangaldai, where the tea industry is of less importance, they were only 9 per cent of the whole. The total number of persons censused in the district in 1901 who had been born outside Assam was 84,749, more than two-thirds of whom came from the Province

of Bengal. The immense mass of these immigrants were garden coolies, but Bengalis also find employment in Darrang as clerks and shop-keepers, while practically all the wholesale trade is in the hands of Marwari merchants from Rajputana. The Bhutias who were censused in the plains were only temporary visitors who descend from the hills in the cold weather, but the Nepalese are settling in Darrang in considerable numbers. Many of them are graziers, sawyers, and rubber tappers, but they are also taking to cultivation, especially in the Gohpur and Behali mauzas. Darrang gains largely by inter-district migration, as comparatively few people leave the district, and there is a considerable influx from Kamrup and Nowgong. About 4,000 of the immigrants from Kamrup were probably Kachari coolies working on the tea gardens, but the great bulk of the remainder must have been ordinary cultivators attracted by the broad stretches of culturable waste land still available for settlement.

At each of the last four enumerations there has been a great disparity between the sexes, and, in 1901, there were only 916 females to every 1,000 males. This is, however, principally due to the large foreign element in the population, in which women are always in a minority, and amongst those born and enumerated in Darrang the proportion rises to 984. Infant marriage is quite the exception, as will be seen from the statement in the margin, which shows the percentage of Hindu girls under 10, and between 10 and 15, who have performed the marriage

**Sex and
marriage.**

Percentage of Hindu girls married and widowed.			ceremony ; and the percentage of girls between 15 and 20, who, even according to western ideas, would be considered <i>aptæ viro</i> , who were still unwed. For the purposes of comparison similar figures have been inserted for Goalpara, as that district has been infected with the singular idea, that is unfortunately so general in Bengal, that social status can in some way be obtained by submitting an immature child to the responsibilities of matrimony. In an equal number of girls under ten there are seven who have been married in Goalpara, for everyone who has performed the ceremony in Darrang ; and in the latter district more than a third of the girls, even between 15 and 20, were still unwed.
Age.	Goalpara.	Darrang.	
0 10	4·8	0·7	
10 15	62·4	14·7	
	Percentage.	Unmarried.	
15 20	7·2	36·5	

The growth of the population depends to some extent upon the number of potential mothers. Assuming that this class is represented by married women between 15 and 40, it appears that the reproductive section form 164 per mille of the total population, which is 7 per mille more than the proportion for the Province as a whole.

Infirmities. Darrang as a whole is fairly free from three out of the four special infirmities recorded at each census. The number of persons returned as insane in 1901 was below the Provincial average, after allowing for the lunatics censused in the Tezpur Asylum who had been born outside the district. Deaf-mutism is, however, fairly common,

and the proportion afflicted not only exceeds the Provincial average but is more than 50 per cent higher than that prevailing in India as a whole. The percentage of lepers is considerably lower than that returned from most of the districts of the Province, but is much in excess of the average for the whole of India.

The abstract in the margin shows the number out of

	Darrang. Assam. India.			10,000 males afflicted in
Insane ...	7	5	3	Darrang, Assam, and the
Lepers ...	8	13	5	Indian Empire as a whole.
Deaf-mutes...	10	9	6	
Blind ...	6	10	12	

The figures for males only have been given, as the return for females, especially in the case of leprosy, is probably not so accurate.

Assamese and Bodo or Kachari are the forms of speech **Language.** natural to the indigenous inhabitants of the district, and the former was used by 51 per cent of the population in 1901, the latter by 16 per cent. The bulk of the Kachari speakers are found in Mangaldai, in the grassy plains at the foot of the Himalayas, but, though faithful to their tribal form of speech in their own homes, most of the villagers understand and speak Assamese as well. Bengali was returned by 19 per cent of the population, but it is doubtful whether in many cases the term indicates more than a foreign language, Bengali and foreigner being almost interchangeable expressions amongst the Assamese. Hindi was used by nearly 4 per cent, and Mundari by nearly 2 per cent of the people censused in Darrang in 1901. Assamese is described by Dr Grierson as the sister not the daughter of Bengali.* It comes from

* Report on Census of India, 1901, Vol. I, p. 324.

Bihar through Northern Bengal and not from Bengal Proper. The plural and feminine gender are formed in a different way from that in use in Bengali, and there is a considerable difference in the conjugation of the verb, in the idiom, the syntax, and even in the vocabulary. The pronunciation is also different, the Bengali sh being converted into h by the Assamese, and ch into s. Kachari, or Bodo as it is more properly called, is a fairly rich language remarkable for the ease with which roots can be compounded together. A grammar of this language has been published by the Reverend S. Endle.*

Caste.

A complete absence of distinction is the dominant note in the caste organization of Darrang. Brahmans, Baidyas, and Kayasthas are the aristocracy of Eastern India, and each of these three castes is very poorly represented in the district. The Ganak would rank after the Kayastha in ordinary estimation in Assam, but unfortunately in Mangaldai, where the majority of the Darrang Ganaks are found, they have fallen from their high estate and have sunk to a very low position in the social scale. Next to the high class Ganak come the Kalita and Kewat, but these two castes, though numerous in the neighbouring district of Kamrup, barely total 31,000 in Darrang. Other castes conspicuous by their absence are the two great race castes of Sibsagar and Lakhimpur, the Ahom and the Chutiya, who between them number less than 7,000 souls. The bulk of the indigenous inhabitants were probably originally Kacharis who, with their kinsmen the Rabhas, reached a total in 1901 of nearly 79,000

* Shillong Secretariat Press, 1884.

persons, six-sevenths of whom were found in Mangaldai. The Kachari, on conversion to Hinduism, is admitted into the ranks of the Koch, and it is only natural that these Koches (47,000) should be numerically the strongest section of the Hindus in the district. The Jugis and Nadiyals, both of whom come low in the social scale, are fairly strongly represented, and in the Tezpur subdivision the cooly castes, such as the Munda, Santal, Bhuiya, and Oraon are found in considerable numbers. Two hundred and three Europeans were censused in the district in 1901, 167 of whom were living in the *sadr* subdivision. Brief notes are appended describing the principal features of each of the indigenous castes, of whom there were 5,000 or more in the district in 1901 *

A certain proportion of the Brahmans are foreigners, **Brahmans.**

Males	...	3,634
Females	...	2,798

either natives of Bengal acting in some ministerial capacity, or Nepalese who have settled in the district,

but the great majority are natives of Assam. Most of them subsist on the profits of their farms, which they either plough with hired labour, or, if they are too poor to engage a servant, cultivate with the hoe, as a Brahman is not allowed to touch the plough with his own hands. Of the remainder some take service as cooks, some act as priests; though the number of the latter is not large, as few of the Brahmans of Darrang are sufficiently well versed in the *shastra* to be qualified for the priest-

* An alphabetical glossary of all castes censused in the Province will be found in Ch. XI of the Assam Census Report for 1901.

hood. The majority of the Brahmans in the district live near Mangaldai town and in the Patharughat tahsil.

Ganaks.

The origin of the Ganaks is obscure, and, though they claim to be Brahmans, they are regarded with much contempt in Bengal and the Surma Valley. This may possibly be due to their traditional occupation, astrology, as there is a tendency to look down on Brahmans who act as priests or take any practical part in the business of religion. In Assam Proper, the better class of Ganaks occupy a much more dignified position, and are regarded by the common people as ranking second only to the Brahmans. This difference in social estimation is no doubt partly due to the fact that the number of really high caste Hindus amongst the Assamese is comparatively small. Both the Koch and Ahom kings were members of non-Aryan races, and the Ganaks were held in high favour by the rulers of those tribes, a factor which counts for much in Assamese society. Most of the Ganaks of Darrang were censused in Mangaldai, and many of the Mangaldai Ganaks are said to be degraded. They are divided into five classes—(1) Raj Ganaks, who enjoyed the favour of the native rulers, (2) Deori Ganaks, who were employed in temples, (3) Biah Ganaks, who were professional singers, (4) Natoa Ganaks, who were professional dancers, and (5) Bilati Ganaks, who were cultivators. The first three classes do not intermarry with the other two, whose customs are apparently those of the ordinary low caste Assamese.

Males	...	2,963
Females	...	3,283

The Jugis are a low caste, whose traditional occupation **Jugis.** is weaving, and who are looked down upon by their superiors in the social scale ; but, like other humble castes, they lay claim to a high origin. According to one account, they are the offspring of Brahman widows and ascetics, while others assert that they are descended from Gorakshanath, who was an incarnation of Siva. Very few Jugis now earn their living as weavers, and the caste as a whole has taken to agriculture as a means of livelihood.

In the Otolā and Punia mauzas of Mangaldai there is a section of the caste known as the Kankuruli Jugis. Their social position is extremely low, they bury their dead, have no religious ceremony at marriage or death, and have only recently obtained gosains. The Katani Jugis emphatically deny that they were ever in any way connected with the Kankurulis. The Katanis are said to have entered the Province in the days of Ballal Sen, and till the time of the Darrang Raja Madho Narayan (1728—1778 A. D.) their position was extremely low. Under his patronage they made considerable advances in the social scale, and they now enjoy a better position in Darrang than in any other part of the Assam Valley. They claim to rank with the Koch, and several gosains have certified that the higher castes may take water from their hands.

The Kacharis or Bara (mispronounced Bodo), as they **Kacharis.** call themselves, belong to the great Bodo tribe, which is found, not only in the Brahmaputra Valley, but in

Kacharis.		
Males	...	33,422
Females	...	29,804

the Garo Hills and in Hill Tippera, south of the Surma Valley. It is generally supposed that they are a section of the Indo-Chinese race, whose original habitat was somewhere between the upper waters of the Yang-tse-kiang and the Hoang-ho, and that they gradually spread in successive waves of immigration over the greater part of what is now the Province of Assam. This theory has much to recommend it, though, as a matter of fact, apart from the southward movement of the Miris and Chutiyas, most of the tribal migrations of which we have actual knowledge have been from the south towards the north. This was the direction of the Ahom invasion in the thirteenth century, the traditions of the Nagas all represent them as coming from the south, and the northward movement of the Kuki tribes was only stopped by the intervention of the British Government. On the other hand, Mr. Dundas quotes a prayer used by the Dimasa in the North Cachar Hills, which supports the view that the tribe came from the north-east. It refers to a huge peepul tree growing near the confluence of the Dilao (Brahmaputra) and the Sagi. There the Kacharis were born and increased greatly in numbers, and thence they travelled by land and water till they reached Nilachal, the hill near Gauhati on which the temple of Kamakhya stands. From Gauhati they migrated to Halali, and finally settled in Dimapur. The inscriptions recorded on copper plates in the tenth and eleventh centuries A. D. refer to the conquest of Kamarupa by a foreign dynasty, which was subsequently replaced by a king of the line of Narak.* It is possible that the Kacharis

* *Vide J. A. S. B. Vol., LXVII, Part I, No. 1, 1898, page 99.*

were the invading force, and that they were afterwards dislodged from Gauhati, when they might not unnaturally have retreated towards the Dhansiri valley.

The Kachari kingdom was one of the strongest powers with which the Ahoms were confronted when they entered the valley of the Brahmaputra. Their capital was located at Dimapur on the Dhansiri river, and at one time they were in possession of the western part of Sib-sagar, and the greater part of Nowgong. Dimapur was sacked by the Ahoms in 1536, and the Kachari king was compelled to move his capital to Maibang. Subsequently they migrated to the plains of Cachar, and the last representative of the line was assassinated there in 1830. It seems, however, doubtful whether the Kacharis who live on the north bank of the Brahmaputra were ever in any way connected with the king of Dimapur. The one tribe style themselves Bara, the other Dimasa; and, though both use languages of Bodo origin, the difference between plains Kachari and Dimasa is greater than that between French and Spanish. The two tribes sprang no doubt from the same stock, but there is no evidence to show that they were ever united by the tie of a common nationality, or that the Kacharis of Darrang were more closely connected with the Kacharis of North Cachar, than are the Rabhas or Lalungs.

The following legend, which is prevalent amongst the Dimasa, has been reported by Mr. Dundas. It would account for the separation of the Bodo and Dimasa, but no traces of the story have been found amongst the Kacharis of Darrang:—

**Difference
between
Dimasa and
Bodo.**

"Long ago the Dimasa fought against a powerful tribe and were beaten in a pitched battle. They were compelled to give ground, but after a time further retreat was barred by a wide and deep river. In despair the king resolved to fight again on the following day, but in the night a god appeared to him and told him that the next morning the army could cross the river if they entered it at a spot where they saw a heron standing on the bank. No one, however, was to look back while the movement was in progress. The dream proved true. A heron was seen standing on the bank, and the king and a great portion of his people crossed in safety. A man then turned to see whether his son was following, when the waters suddenly rose and swept away those who were in the river bed and prevented the others from crossing. The Dimasa were those who succeeded in reaching the further bank in safety."

**Mode cus-
toms.**

The names of various clans are still remembered in Darrang, but they seem to be of a totemistic origin, and, at the present day, the tribe is not split up into any endogamous or exogamous subdivisions. Their social position is of course low, but the Hindu gosains are willing to receive them as their disciples, and, if they are prepared to abandon their pork and beer, will even enrol them as members of the Koch caste. The bulk of the Kacharis live on the grassy plains at the foot of the Himalayas, and are especially numerous in what are known as the Kachari Duars, *i. e.* Kariapara, Buriguma, Khaling, and Chatgari and in the Kowpati mauza. Their villages are surrounded with fences, but present a dirty and untidy appearance, as pigs and fowls are allowed to wander about in all directions. Agriculture is their normal occupation, and rice the staple crop grown. They are fully alive to the advantages of irrigation and conduct the water of the hill streams on to their fields through little artificial channels. But, though efficient

agriculturists, they have not that contempt for daily labour which is so marked a characteristic of the Assamese. They readily take work on tea gardens, and in 1901 nearly 14,000 Kacharis were censused on the plantations.

Though still using their tribal form of speech in their own villages, most of them can speak and understand Assamese. The national religion is of the ordinary animistic type. The principal god is called Siju, and used formerly to be represented by the cactus (*euphorbia splendens*) found growing in the courtyard of every Kachari house; but of recent years the tulsi plant has largely superseded the cactus, as the outward and visible sign of the deity. In addition to Siju, there are a large number of other spirits most of which are hostile to men; and the principal object of religion is to ascertain in times of trouble the name of the spirit responsible, and the way in which it may most easily be appeased. The dead are usually burned, but are sometimes buried, from motives of economy. Marriage is generally by purchase, a bride costing from Rs. 50 to Rs. 70, and, where the man is unable to provide this sum, he goes to live with his father-in-law and works for him. A year's labour is only reckoned as being worth from Rs. 20 to Rs. 30, but it must be borne in mind that during the time that he is working for his bride the man is fed and clothed by his father-in-law. Pregnancy prior to marriage does not entail any social disability, provided that the father acknowledges the child and is a Kachari by caste.

Kalita.

The following account of the origin of the Kalita caste

Males ...	... 9,690	is reproduced from the Report on
Females	... 8,146	the Census of 1901.

"There is much uncertainty as to the origin of this caste. The popular explanation is that Kalitas are Kshatriyas, who, fleeing from the wrath of Parasu Ram, concealed their caste and their persons in the jungles of Assam, and were thus called Kul-lupta. Other theories are that they are Kayasthas degraded for having taken to cultivation, an explanation which in itself seems somewhat improbable, and does not appear to be supported by any evidence, or that they are the old priestly caste of the Bodo tribe. The latter theory can hardly be said to account for their origin, and though it is possible that Kalitas may have originally acted as priests this fact throws little or no light on the problem of what the Kalitas are. The most plausible suggestion is that they are the remains of an Aryan colony, who settled in Assam, at a time when the functional castes were still unknown in Bengal, and that the word "Kalita" was originally applied to all Aryans who were not Brahmans. The Kalitas are divided into two main subdivisions, Bar and Saru, and into a number of professional subcastes. In Upper Assam, Bar Kalitas are said to decline to use the plough, though they occasionally work with the spade, but there is no such restriction in Kamrup where the great bulk of the caste is found. Cultivation is, in fact, the traditional occupation of the caste, and they even consent to work as coolies on tea gardens. The usual procedure for a Kalita who has succeeded in rising above the necessity for manual labour, and is no longer compelled to follow the plough, is to call himself a Kaist or Kayastha. Two explanations are given of the origin of the Saru Kalita—one that he is the offspring of persons who for three generations back have not been united by the "hom" ceremony, the other that he is the child of a Bar Kalita and a Kewat woman. Whether the Bar Kalita can inter-marry with and eat *kachchi* with the Saru Kalita seems open to question, and the practice apparently varies in different districts; but there seems to be no doubt that the functional subdivisions of the caste are debarred from the privilege of close intercourse with the Bar Kalita. These subdivisions are the Mali, Sonari, Kamar, Kumhar, Napit, Nat, Suri and Dhoba. The first two inter-marry with the Saru Kalita, and also with the Kamar Kalita. The last four groups are endogamous. All these functional groups are to some extent looked down upon, probably because followers of

these professions, who were not true Kalitas, have occasionally succeeded in obtaining admission within their ranks; but the goldsmiths, from their wealth, have secured a good position in society. Kalitas have a good Brahman for their priest, and their water is taken by every caste, a fact which no doubt explains the high value attached to Kalita slaves in the time of the Assam Rajas, when two Koches could be purchased for the price of a single Kalita, though the Koch is generally the hardier and stronger man of the two."

Early marriage is common in Goalpara but not in Assam Proper, except amongst the upper sections of the caste. They take, in fact, a liberal view of the relations between the sexes, and cohabitation is the essential part of marriage. Well-to-do Kalitas are invariably united by the *hompura* rite and employ a Brahman, but the poorer people often content themselves with the *agchauldia* or *juron* ceremonies, which consist of a feast to the villagers and a public acknowledgment of the position of the bride. Some authorities hold that this, though a valid form of marriage for the lower Assamese castes, is not sufficient for the Kalita. They regard the *hompura* rite as the one essential ceremony of purification, but it can be performed after cohabitation has begun, and sometimes takes place after the death of the husband. An unmarried girl who becomes pregnant does not forfeit her position in the society unless her lover is of a lower caste. The bulk of the Kalitas were censused in the Tezpur, Chutia, and Patharughat tahsils.

Many of the Kayasthas are foreigners, and most of **Kayastha.**

Males ...	.. 1,048	them earn their living as Govern-
Females ...	... 641	ment servants or tea garden clerks.

Kalitas who have risen above the necessity for manual labour also frequently describe themselves as Kayasthas.

Kewats.

The Kewats are a respectable Hindu caste, from whose hands Brahmans will take water and who, according to Assamese ideas, rank immediately after the

Males	...	7,546
Females	...	6,077

Kalita. These remarks only hold good, however, of the Halwa or cultivating Kewats, as the Jaliya, or fishing subdivision of the caste, occupy a very humble position in the social scale, and are considered little better than Nadiyals. The two sections of the caste have nothing whatever in common except the name, Kewat or Kaibartta, but the number of Jaliya Kewats is comparatively small. The ordinary occupation of the caste is agriculture, but a few of them have succeeded in reaching that desirable position in which the pen takes the place of the ploughshare as a means of livelihood. A respectable Brahman acts as their priest.

The Nadiyals.

Males	...	5,491
Females	...	5,291

The Doms, or as they prefer to call themselves Nadiyals, are the boating and fishing caste of Assam. They are anxious to assume the name Jaliya Kaibartta, but the Kaibarttas are unquestionably a different caste, though the manners and customs of the Jaliya Kaibartta do not differ materially from that of the Assamese Nadiyal, except in the following particulars. The Kaibarttas decline to use the *ghokota* net, and in theory only sell their fish on the river's bank within a paddle's throw of the boat, whereas the Nadiyals regularly take their catch to market. The Nadiyals are probably descended from the aboriginal race of Doms, the ruins of whose forts are still to be seen in India, but migrated to Assam

before the Dom caste had been assigned the degrading functions now performed by them in Bengal. They are cleanly in their habits and particular in their observance of the dictates of the Hindu religion, and account for the objectionable expression "Dom," which undoubtedly they have borne for centuries, by saying that they were the last of the Assamese to be converted from Buddhism. They are darker in complexion than most of the Assamese, but have a good physique, and by no means uncomely faces. Their women are most prolific and the Dom villages are full of fat brown babies. They rank very low in the social scale, and, according to Assamese ideas, are superior only to the Brittia Baniya or Hari. The bulk of the caste still live by fishing, and education has made but little progress among them. Marriage does not take place till the girl is fully grown, and they are free from any puritanical notions with regard to the relations between the sexes. Their priests are said to be descended from a Brahman father and Nadiyal mother, but for all practical purposes they are Nadiyals and inter-marry with Nadiyal girls. In Mangaldai, the Nadiyals are said to be divided into three sections, the Muchi or traders, the Kheoli or wholesale, and the Machua or retail fish-sellers.

The Rabhas are a section of the Bodo race and appear to be an offshoot of the Garos. **The Rabhas.**

Males	...	7,517
Females	...	7,914

Their language is closely akin to Garo, and their original habitat seems to have been the northern slopes of the

Garó Hills. Certain sections of the tribe, which live on the borders of that district, have no word for north and south, but describe the former idea by Bhutan, the latter by Tura; a fact which pretty clearly indicates the locality from which they originally came. Most of the Rabhas have, however, left their ancestral home and settled in the Mangaldai subdivision of Darrang, Kamrup, and Goalpara. In Goalpara, Rabhas are divided into the following seven sections—Rangdania, Pati, Maitariya, Koch, Bitlia, Dahuria, and Sangha; but these subdivisions are not recognized in Darrang. There the tribe is divided into various groups which have apparently a totemistic origin. The *phalmals* fast when their ploughs break, the *maihals* when their buffaloes die, the *baghuals* mourn the death of a tiger, and so on. Like the other animistic tribes they are fond of beer, pork, and chicken, but they abstain from beef. Their villages are not unlike those of the Kacharis. They have gardens, and fruit trees, but pigs and fowls do much damage and the homestead is very different from the green dankery of bamboos, fruit trees, and vegetables which surrounds the houses of the Assamese. Agriculture is their usual occupation, and rice the staple crop grown. What money they require is usually obtained by selling rice or poultry or by working on the roads or on tea gardens. Adult marriage is in vogue, and the lover is required to pay for the object of his affections. The usual price is from Rs. 25 to Rs. 60, but, if the money is not forthcoming, the bridegroom works in the house of his father-in-law; one year's labour being considered

the equivalent of about Rs. 20 in cash. Vermillion is smeared on the bride's forehead, a practice which does not obtain amongst most of the aboriginal tribes, but the essential part of the ceremony is the killing of two fowls and the feasting of the villagers. The Pati Rabhas go further than this, and model their procedure as closely as possible on the Hindu ceremony. The dead too are generally burned, unless an epidemic is in progress, when it is thought that the infection might be conveyed in the smoke of the funeral pyre. In their unconverted state they worship deities known as Bharali and Kubir Gosain and make offerings to the spirits of the forest and the marsh. Like the Kacharis they are very sceptical as to the possibility of a life after death.

The Koches are one of the race castes of Assam. Originally they were an aboriginal tribe, **The Raj-bansi or Koch.** apparently of Mongolian origin, which, at the beginning of the sixteenth century, rose to power under their great leader Viswa Singh. His son, Nar Narayan, extended his conquests as far as Upper Assam, Tippera, and Manipur, and by the middle of the sixteenth century, the Koch king had attained to a position of such power that the aboriginal people were anxious to be enrolled as members of his tribe. The result is that at the present day the name is no longer that of a tribe but of a caste into which new converts to Hinduism are enrolled. In Sibsagar and Lakhimpur, these converts still retain their tribal names, and the Koch is a respectable Sudra caste, which is not broken up into various subdivisions. This is not the case in Lower

Males	...	24,064
Females	..	23,363

Assam, and the different groups are there allotted a different status, which is dependent on the time that has elapsed since conversion took place, and the extent to which aboriginal habits have been shaken off. The principal subdivision is the Bar Koch, who are looked upon as a clean Sudra caste and from whose hands Brahmans will take water. The same distinction is not accorded to the Saru Koch, though they conform in most essentials to the somewhat lax standard of Hinduism exacted in Assam. Three other subdivisions are graded in accordance with the extent to which they have forsworn the attractions of unconverted life. The Kamtali abstain from intoxicating liquor and usually from pork ; the Hiremia still keep pigs but no longer indulge in the use of liquor; while the Madahi are Hindus only to the extent of having taken *saran*, and still permit themselves great freedom in all matters of food and drink. The Koches are widely distributed all over the district, but are especially numerous in Mangaldai.

Religion.

Classified by religion the population of Darrang was distributed in the following proportions in 1901 :—Hindus, 71 per cent ; Animistic tribes, 23 per cent ; and Muhammadans, 5 per cent.

Saktism.

Of the Hindus who specified their sect, 27 per cent returned themselves as Saktists, or worshippers of the reproductive powers of nature as manifested in the female. Two-fifths of these Saktists were, however, censused on the tea gardens, and a considerable number of the Saktists in the villages were probably ex-garden coolies. To people such as these, Saktism, with its toleration of

liquor and animal sacrifice, would appeal more strongly than the milder and more civilized tenets of the Vaishnavites. Appended to this chapter will be found a list of the temples in Darrang which are endowed with grants of land. They are styled temples for want of a better name, though many of them now are nothing more than little huts of reeds and thatch.

Sivaitism is the counterpart of Saktism, and is concerned with the worship of the procreative energy as manifested in the male. In 1901, only 1,656 persons in Darrang professed this special form of Hinduism. Sivaitism.

Seventy-two per cent of the Hindus who returned their sect in 1901 declared their adherence to the milder tenets of the Vaishnavites. This form of Hinduism is thus described in the Assam Census Report for 1901 : Vaishnavism.

Sankar Deb, the apostle of Vaishnavism in Assam, was born in 1449 A.D., and was the descendant of a Kayastha, who, according to tradition, had been sent, with six of his caste fellows and seven Brahmans, to Assam by the king of Kanaijpur as a substitute for the Assamese prime minister, who had fled to his court for refuge. The licentious rites of Saktism had aroused his aversion while he was still a boy, and his desire to found a purer system of religion was increased by the teachings of Chaitanya in Bengal.* Like most reformers, he met with vehement opposition from the supporters of the established order, and he was compelled to leave his home in Nowgong and to fly to the inhospitable jungles of the Barpeta subdivision, where, in conjunction with his disciple, Madhab Deb, he founded the Mahapurushia sect, the main tenets of which are the prohibition of idolatry and sacrifice, disregard of caste, and the worship of God by hymns and prayers only. Sankar himself was, like a true follower of Chaitanya, a vegetarian, but the low-caste people, who formed a large proportion of his converts, found his injunction a

* The Assamese do not admit that Sankar Deb was, in any sense of the word, a disciple of Chaitanya.

counsel of perfection, and the Mahapurushias are accordingly allowed to eat the flesh of game, but not of domesticated animals, though, with a subtlety only too common in this country, they observe the letter of the law, prohibiting the spilling of blood, by beating their victims to death. The great centre of the Mahapurushia faith is the sattra at Barpeta, where a large number of persons persist in living huddled together, in defiance of all the laws of sanitation, and resist with surprising pertinacity all efforts to improve their condition. They are a peculiarly bigoted people, and are strongly opposed to vaccination, with the result that the mortality from small-pox in the neighbourhood of the sattra is exceptionally high. It was not long, however, before the Brahmins re-asserted their influence, and, shortly after Sankar's death, two of his followers, who were members of this caste, established sects, called, after their founders, Damodariya and Hari Deb Panthi, which are distinguished from the Mahapurushias by the respect paid to the distinctions of caste, and a certain tolerance of idolatry. A fourth sect was founded by one Gopal Deb, but it originally seems to have differed in no way from the Mahapurushia creed, and subsequently its followers adopted the teachings of Deb Damodar. There is, in fact, practically no distinction between the Damodariyas, the Hari Deb Panthis, and the Gopal Deb Panthis, and the Vaishnavites of the Assam Valley can be divided into the Mahapurushia and Bamunia or "other Vaishnavas," as they have been called in the census tables. The former will accept a Sudra as a religious guide, worship no god but Krishna, and are uncompromising in their hostility to idols; the latter will only recognize Brahmins as their gossains, permit the adoration of other deities, such as Siva and Kali, in addition to that of Krishna, and allow sacrifices to be offered in their honour. The Bamunias are also more liberal in their diet, and will eat goats, pigeons, and ducks, a form of food that is not allowed to orthodox Vaishnavites in Bengal.

Madhab Deb, like most religious reformers, was a strict disciplinarian. The story goes that the breach between him and Gopal Deb arose one stormy day when the party were returning to Barpeta by boat. Gopal Deb, anxious for the safety of his teacher, apostrophized the storm clouds passing overhead, and begged them to restrain their fury till Madhab had reached

the shore in safety. This innocent remark was construed into an invocation of Varuna, the god of rain ; Gopal Deb was denounced as an idolater and was incontinently, by order of Madhab, flung out of the boat. Such treatment was enough to damp the enthusiasm of the most ardent disciple. Gopal Deb, wallowing in the water, gallantly shouted out defiance to his former leader, and warned him that in future he would be treated with uncompromising opposition. Thirty-nine per cent. of the Vaishnavites in Darrang in 1901 were said to be members of the Mahapurushia sect, the great majority of whom were censused is the *sadr* subdivision.

Every Vaishnavite is the disciple of some particular Gosains and Sattras. gosain or priest, to whom each year he sends an offering which varies from four annas to four or five rupees, according to his means. These subscriptions are collected by the *medhi*, or agent of the gosain, who is accorded a position of some dignity at village feasts, and sometimes ranks as high as the *gaobura*, or head man appointed by the Government. For the Mahapurushias the centre of religious life is Barpeta. In the eastern portion of the district most of the Vaishnavites, who are not Mahapurushias, are disciples of the great gosains of Auniati, Dakhinpat, and Garamur, whose *sattras* are situated on the Majuli in the Sibsagar district ; though some are followers of the Kuruabahi gosain of Nowgong, and others of the Moamaria gosain of Lakhimpur. In Mangaldai, the great gosains of the Majuli claim many followers, but a certain number of the people are the disciples of the petty gosains whose *sattras* are situated in Darrang. A

list of these *sattras* is appended to this chapter. In each village there is a *namghar* or large barn like structure, in which the people assemble for prayer and song, and which serves as a centre for the religious and social life of the place.

**Muham-
madanism.**

Only one-twentieth of the population in 1901 declared themselves to be followers of the Prophet. The great bulk of these persons were living in the Mangaldai subdivision, about half of them being inhabitants of the Patharughat tahsil, which is situated in the extreme south-west corner of the district. In the seventeenth century A.D., the Muhammadans were, from time to time, in possession of Gauhati and the whole of Kamrup, and were able to make their influence felt immediately beyond their borders. But the expeditions they despatched up to the Bhareli would naturally have no permanent effect, and in the eastern part of the district they did not make any converts. After the expulsion of the Musalmans from Kamrup in 1681 A. D. the simple villagers, who had been converted to the faith of Islam, began to forget the principles of their religion, and to be gradually affected by the customs of their Hindu neighbours. They practised circumcision and offered prayers after the Muhammadan fashion it is true, but they could not read the Koran, and service was held in the open fields, as there were no buildings set apart for the purpose. They dressed, shaved, and worshipped idols like Hindus, they eschewed beef and declined to kill a cow, and in times of sickness and trouble endeavoured to obtain relief by reciting *mantras* and singing hymns. This state of affairs is said

to have continued till 1880, when a revival of the true Muhammadan faith was inaugurated by a preacher called Zalkad Ali or Safi Saheb, who came from Gauhati and spent some years in the subdivision of Mangaldai. Fired by his example the Muhammadans abandoned their Hindu superstitions, allowed their beards to grow, and took to eating beef. Thatched houses were erected to serve as mosques, and the ordinary villager at the present day conforms, outwardly at any rate, to the dictates of the Muhammadan faith. They have not, however, succeeded in entirely freeing themselves of the ideas they borrowed from the Hindus, and, when cholera or small-pox appear in epidemic form, secretly recite *mantras*, in the hope that by this means they may be preserved from falling ill. Cases of proselytism are extremely rare, and, during the last fifteen years, only two persons in the whole of the Patharughat tahsil are said to have been converted to the faith of Islam.

Most men find considerable difficulty in giving a **Animism.** clear and intelligible account of the faith that is in them, and the unconverted tribesmen are no exception to the general rule. Broadly speaking, their religious beliefs seem to fall under the following heads. Unlike the German metaphysician, they have no uncomfortable doubts with regard to their own existence and the existence of the material world. To account for the production of these visible phenomena, they put forward various theories, which are hardly more improbable than the accounts of the creation given in most religious systems. But the way in which the world came into exist-

ence is, after all, a matter of no very great importance, and the essential object of religion is to ensure a comfortable passage through life to its followers. No country or community is exempt from pain and trouble, and to the dwellers in the plains of India has been allotted a fairly liberal portion of the ills of life. When the cattle die, or small-pox or cholera visit the village, or other trouble comes, it is only natural to suppose that somebody or something is the cause of these misfortunes. The simple tribesmen then endeavour to ascertain the particular spirit from whose displeasure they are suffering, and to appease him in whatever way they can.

The great bulk of the animistic population was censused in Mangaldai in the Kalaigaon tahsil and the mauzas at the foot of the Bhutan Hills, and more than two-thirds of them were Kacharia.

Minor religions.

Religions which were not strongly represented in the district in 1901 were:—Buddhists (494), Jains (269), Brahmos (35), and Sikhs (9). Nearly all the Buddhists are temporary visitors who come down during the cold weather to the fairs held at the foot of the hills, and from there disperse about the country. There are, however, three Bhutia families, who for the last 25 years have been living in the Paneri grant village in mauza Jhaprabari in Mangaldai; and a few of the Nepalese settlers describe themselves as Buddhists. The Jains are “Kaiyas,” or merchants from Rajputana, who have succeeded in securing a practical monopoly of the wholesale trade of the district. The Brahmos are educated natives, most of whom were censused in Tezpur town,

The Christian population of Darrang is not large, and, **Christians.** in spite of the efforts of a representative of the Society for the propagation of the Gospel in foreign parts, who for many years has laboured amongst the Kachari population of Mangaldai, there were only 1,128 native Christians in 1901. The great majority of those who returned their sect were members of the Anglican communion, but nearly 300 natives took refuge in the generic term of "Kistan," without pledging themselves to support any one of the numerous sects into which that religion is divided. Christianity seems, however, to be spreading steadily, if very slowly, as in 1881 there were only 235 native Christians and, in 1891, 642.

The occupations recorded at the census of 1901 were **Occupation.** divided into eight main classes, and the numbers returned under each head were as follows :—

	Total number.	Percentage.
Government... ..	1,192	...
Pasture and agriculture... ..	311,518	92
Personal services	3,877	1
Preparation and supply of material substances, ...	9,607	3
Commerce, transport and storage	3,437	1
Professions	1,853	1
Unskilled labour not agricultural	1,774	
Means of subsistence independent of occupation	4,055	2

The district is a purely rural one, and no less than 92 per cent of the population were supported by agriculture. Nearly one-fourth of these persons were employed as garden coolies, and the immense majority of the remainder were small farmers who hold their land direct from the State, and cultivate it with their own hands. Most of them were found in Mangaldai, where the

representatives of the family of the Darrang Rajas hold a considerable area at privileged rates of revenue. There were altogether in the district in 1901, 16,468 persons returned as tenants and their dependents. Others were garden coolies who rent land which had been prepared for cultivation by the Assamese. There is, however, in the district such an abundance of good land awaiting settlement that the number of tenants must of necessity be small, and there is little risk of oppressive rents being asked or paid. The only non-agricultural occupation, if occupation it can be called, which supported as much as one per cent of the total population was begging. The majority of these beggars were women, and were probably old widows supported by the charity of their neighbours.

**Reasons for
preponderance of
agriculture.**

The extraordinary preponderance of agriculture as a means of occupation is due to two causes. In the first place the district is a purely rural one, it contains only one small town, and the urban population is only a little more than one per cent of the whole. There is, moreover, an almost complete absence of the functional castes. There is no village barber or dhobi in the Assam Valley, and, though there are a considerable number of Jugis in Darrang, they no longer earn their living at the loom. It would hardly be correct to say that they have forsaken their traditional occupation, as they, in common with most of the villagers in Darrang, are weavers. The work is, however, carried on by the women; and only enough clothing is produced to satisfy the requirements of the family, or perhaps to leave a few silk cloths over to sell when money is wanted to satisfy the

land revenue demand. Occupation has not been specialized in the Assam Valley, and each household supplies almost all its simple wants. The fishing and boating castes are not strongly represented, and many of their members have either abandoned their traditional occupation for agriculture, or have, at any rate, preferred to return it as a more respectable avocation on the census schedules. The number of priests in Darrang is also small. The occupations returned at the census of 1901 were divided into 520 separate classes, and the figures for each class will be found in Part II of the Report on the Census of that year. These figures do not, however, lend themselves readily to review, as agriculture is practically the beginning and end of all things in Darrang.

The forms of marriage in vogue are the *hompura*,* * Marriage customs. or full Hindu rite, when the sacred fire is lighted and a priest is engaged to perform the ceremony; the *khari moni pindha*, in which a feast is given to the friends and relations and ornaments are given to the girl; and the system under which the bridegroom, who is called a *caponiya*, enters the house of his prospective father-in-law, and works for his wife as Jacob worked for Rachel. Brahmans, Kayasthas, and well-to-do Kalitas invariably perform the *hompura* ceremony, which sometimes costs as much as Rs. 500. This expenditure is incurred on the purchase of ornaments and clothing, on the payment of priests, musicians, and palki bearers, and on a feast to the relations and friends, the principal ingredients of

*A description of this ceremony as practised in Assam will be found on p. 63 of the Census Report for 1901.

which are rice, molasses, curds and betelnut. The practice of taking a bride price is fairly common, especially in the western part of the district. In this particular there is a great difference between the customs in vogue in Upper and Lower Assam. In Upper Assam it is considered a mark of respectability to give your daughter away; in Lower Assam the custom of asking a bride price is almost universal, even amongst the Brahmans. Darrang, as is natural, occupies a more or less intermediate position, and on the west attorns to the customs of Lower, and on the east to the customs of Upper Assam. If the price demanded is too high the young people often take the law into their own hands, and the girl arranges to have herself abducted; as, when her lover has once obtained possession of her person, he is generally able to induce the parents to be more moderate in their demands. This form of marriage by capture is very common amongst Nadiyals, Brittial Baniyas, and Charals or Namasudras.

The *caponiya* is generally accorded all the privileges of a husband, as soon as the parents of the girl are satisfied that he intends to remain faithful to his engagements. In Upper Assam the *caponiya* is looked down upon, but his position is somewhat better in Darrang. Marriage, even by the simplest rites, entails a heavy charge upon the bridegroom. The ordinary cultivator seems to spend about one hundred rupees upon his wedding, a sum out of all proportion either to his capital or income. The result is that many men have to borrow at high rates of interest to obtain a wife, and are

often crippled for years by the expenses incurred on the occasion of their marriage. Ahoms are often married by the *chaklong* rite, in which the box in which betelnut is carried (*temi*) and the knife with which it is cut (*katari*) are exchanged, and the nuptial knot is tied. The *Jhopa goriya* form of marriage is also in use amongst the Nadiyals at the eastern end of the district. The bride and bridegroom are led round five or six baskets, and the one raises and the other, following close behind, closes the lids.

Feasts, singing parties, and *bhaonas* or simple theatrical performances are the principal amusements of the villagers. The *bhaonas* are often held in temporary sheds constructed by the road side, and on a winter's morning the traveller who is early abroad frequently comes upon parties of revellers still lingering over the pleasures of the previous night. The *dol jatra* or festival in honour of Krishna in February or March, when the image of the god is swung to and fro, and the people pelt one another with red powder in memory of his amorous exploits with the milk maids of Brindaban, is observed indeed, but with much less ceremony than in other parts of India.* The *Janmastami* in honour of Krishna's birth in August or September, and the *Sivaratri* in memory of Siva in March, are kept as fasts rather than feasts. The Durga puja is observed by Saktists.

The special festivals of the Assamese are the three **The Bihus.** Bihus, and the *sradh* ceremonies of Sankar Deb and

* This festival is, however, in high favour with the garden coolies, by whom it is called the Fagua.

Madhab Deb, the founders of the Mahapurushia sect. The Kartik Bihu is celebrated on the last day of Asvin (about October 14th), and is not an occasion of very much importance. Hymns are sung in honour of god, and, in place of their usual meal of hot rice and curry, the people take cold food, such as curds, molasses, plantains, and cold rice. The Magh Bihu is the harvest home, and begins on the last day of Pous (about January 14th). For weeks beforehand tall heaps of rice straw piled round a central pole are a prominent feature in the rural landscape. At the dawn of day, the villagers bathe and warm their chilled bodies at these bonfires; a very necessary precaution, as, at this season of the year, the mornings are always cold and generally foggy. The Magh Bihu is to some extent a children's festival, and most of the jollification is confined to the smaller boys, who sing and dance, and feast in small grass huts that have been constructed for the purpose. The Baisakh Bihu, which begins on the last day of Choet (April 14th), is in honour of the new year. The cattle are smeared with oil mixed with matikalai, turmeric, and rice, and are then taken to the nearest stream and bathed. The villagers go from house to house visiting their friends and relatives, and offer them presents of cloth and other things. Buffalo fights are organized in the rice fields, but these contests are rather tame affairs, and the animals very seldom injure one another. This Bihu is an occasion of some license, as boys and girls dance together in the fields and sing suggestive songs, and lapses from chastity between members of the same caste

are considered almost venial. This is the season of the year when runaway matches are most common, and during the next few weeks the outraged but avaricious parent, complaining of the abduction of his daughter, is by no means an uncommon sight in the local courts. The *sradh* ceremony of Sankar Deb is celebrated in August—September, and that of Madhab three days before the *Janmastami*. All work is laid aside on these two days, and the people devote their time to feasting and the singing of hymns.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Crops grown—Rice—Mustard—Pulses—Fibres—Storage and threshing of grain—Agricultural implements—Sugarcane—Preparation of molasses—Causes affecting productiveness of land—Garden crops—Yield and value of crops—Floods and irrigation—General remarks—Live stock—Grazing—Cattle disease—Commencement of tea industry—The boom in the early sixties—Scarcity of labour—Collapse in 1866—Expansion of the industry—Labour supply—Site of tea gardens—Soil—Varieties of plant—System of cultivation—System of manufacture—Outturn and prices—Forests—System of management—The reserved forests—Timber trees—Rubber—List of important reserves.

The staple food crop of the district is rice, which in 1902-03 covered 67 per cent of the total cropped area. **Crops grown.** Other important crops are tea (14 per cent), and orchard and garden crops (9 per cent), but a large part of the area shown under this head is occupied by the homestead, and it is doubtful whether as much as one half is actually under cultivation. Mustard occupied 5 per cent of the total cropped area, miscellaneous food grains, nearly all of which are different forms of pulse, 4 per cent, and sugarcane 0·7 per cent. Wheat, barley, and gram, the food grains of Upper India, are grown in small patches by immigrants from those parts, but the total area under these three crops in 1902-03 was only 27 acres. A small quantity of maize is also grown

by foreigners. The general system of cultivation and the manner in which the staple crops are raised is described in the following paragraphs. The area under different crops will be found in Table VII.

Rice. Sali.

Rice falls under three main heads—*sali*, *ahu*, and *bao*, the proportion of the total rice area normally occupied by each of these three classes, being—*sali* 79 per cent, *ahu* 18 per cent, and *bao* 3 per cent. *Sali* dhan, or transplanted winter rice, is first sown in little beds or nurseries (*kothintoli*) near the homestead. The land is broken up in April or May, is ploughed five or six times, and is generally manured with cowdung and sweepings. The seed, which has been selected from the largest ears of the previous year's crop, is sown broadcast over the bed in May and June. It comes up a rich emerald green, and at the beginning of summer these patches of the brightest green herbage are a striking feature in the rural landscape. In the meanwhile the fields are being got ready for the reception of the seedlings. The husbandman starts ploughing as soon as the soil is softened by the spring rain, and repeats the process from four to eight times, till he has reduced the land to a rich puddle of mud. After the third ploughing the field is harrowed, the little embankments, a few inches high, intended to retain the water are repaired, and if the fields adjoin the road or the village site they are fenced in with split bamboo. When the seedlings are about seven or eight weeks old, they are taken from the nursery bed and carried in large bundles (*akhi*) to the field. Here they are planted out in hand-

fuls (*gocha*), each of which contains four or five plants. The distance at which these are planted from one another depends upon the fertility of the soil, but the handfuls are generally placed about 18 inches apart. It is usually the practice to steep the young plants in water before they are planted out, and, unless they are weak and stunted, the tops are cut off at the time when they are removed from the nursery. Transplanting goes on from the beginning of July to the middle of September, and is generally carried out by women. The work is of a most arduous description, and involves stooping for hours in a field of liquid mud, under the rays of a burning tropical sun. Before the end of the rains the crop is fully grown, though the ears are still empty, but about the beginning of October they begin to fill, and the field to turn to a rich yellow. From the middle of November to the middle of January harvesting is going on. Women are not employed on this work in Mangaldai, but in Tezpur, as in Upper Assam, both sexes cut the grain. The reapers grasp a handful of the ears and cut them off about eight inches below the head. These handfuls (*muthi*) are tied up with a piece of straw and left in the field for a few days to dry. When the grain is ready to be transported to the granary, the *muthis* are made into large sheaves. Six to eight *muthis* form a *thor* or *jhap*, and five or six *thors* a *dangari*. A *dangari* is then affixed to either end of a sharp pointed bamboo called *biriya*, and the load, which is called a *bhar* and carried across the shoulder, is taken to the homestead by the men.

The different kinds of *sali* dhan fall under two main divisions, *lahi* and *bar*. *Lahi* ripens earlier than *bar*, and though the grain is of a finer quality the yield is appreciably smaller. It is planted on the higher fields which dry up first at the conclusion of the rains, and which are thus not suitable for *bar*. Altogether there are said to be no less than 68 different varieties of *sali* dhan in the district.

Bao dhan. *Bao* dhan is sown broadcast about the beginning of May, the field having been previously prepared by four or five ploughings. It is grown in flooded tracts, and the embankments made between the fields are smaller than in the case of *sali*, and are sometimes dispensed with altogether. It ripens about the middle of December and is harvested in the same way as *sali*. Five-sixths of the *bao* crop is raised in the tahsils of Patharughat, Mangaldai, and Tezpur.

Ahu dhan. *Ahu* or summer rice is grown either on irrigated land in the submontane tracts (*khurma ahu*) or on low land near the Brahmaputra. For low land cultivation the usual procedure is as follows :—

In May the jungle is pressed down and burnt, and the land left till towards the end of the rains. The jungle that has sprung up in the interval is cleared in the same way, the process being known as *gojala kata*, and ploughing begins in January. The field is ploughed three times and harrowed, and the clods are broken up by a mallet. Another ploughing and harrowing follow, the seed is sown, and the land again ploughed and harrowed, to ensure that the grain becomes thoroughly mixed with

the soil. When the plants are about six inches high and catch the wind *botah boloah*, they are harrowed again and weeded, and finally harvested about the end of August. The crop is, however, a precarious one, and is liable to be destroyed by a sudden rise of the river. The plants can live under water for as much as a week, but if after this time the floods do not retire they are permanently destroyed. *Ahu* is often grown on the *chaporis* in conjunction with mustard, and no jungle cutting is of course required when the soil has been already cleared for the oil seed crop. The same field is seldom cropped for more than three years in succession. The weeds which were unable to find a lodging under the dense growth of *ikra* (*saccharum arundinaceum*), *khagori* (*saccharum spontaneum*) and *nal* (*phragmites roxburghii*), with which the land in its natural state is covered, soon spring up when once the jungle has been removed. After the third year it is less trouble to burn fresh jungle than to clean the old fields of weeds, and by a change of site the peasant gets the further advantage of a manure of ashes for his next year's crop.

Kharma ahu is transplanted, and the system of cultivation does not differ materially from that employed in the case of *sali*, except that it is both sown and harvested much earlier than winter rice. It is generally grown on land which is irrigated from the hill streams, and is extensively cultivated in the north of Mangaldai. The bulk of the *ahu* in Darrang is, however, *chaporis ahu*.

Mustard, as has already been said, is usually grown **Mustard.** in conjunction with *ahu* on the riparian flats. The

jungle is cut down in February and March, and, if the land cannot be prepared in time for summer rice, is allowed to rot upon the ground. What remains is burned in October, the stumps are dug out, and the land is then ploughed over four or five times. The seed is sown about the beginning of November, and the plant is ready to be pulled from the field about the middle of February. It is generally left to dry for a few days, and is then tied in bundles and carried to the homestead, where it is threshed out by the cattle. Mustard is grown all along the banks of the Brahmaputra to a greater or a less degree. The area under this crop in the Patharughat tahsil is particularly large.

Pulses.

Pulse is usually grown on the alluvial flats that fringe the Brahmaputra, in conjunction with summer rice and mustard, but a crop is often taken from the land on which rice seedlings, early rice, and sugarcane have been grown, as it is generally and rightly thought to improve the quality of the soil. In the *chaporis* if new land is taken up the first proceeding is to cut and burn the reeds and grass. Only two ploughings are required, and those are of the very lightest character, and, if the ground is naturally clear of jungle, the seed is sometimes simply sown on the river flats as soon as the floods subside. Pulse is also scattered broadcast amongst the rice stubble, or between the *sali* plants, if the land is still soft, but this method is not generally in use. The seed is sown in September and the crop is ripe about four months later. The plants are pulled up by the roots, left for a few days in the field to dry, and

are then collected at the convenience of the cultivator. The seeds are threshed out by cattle, but as the grains do not separate readily from the pods, their efforts are supplemented by a man with a flail. Several different kinds of pulse are grown, but nine-tenths of the crop belong to the variety known as *mati-mah* (*phaseolus mungo* v. *radiatus*). Other kinds are *magu-mah* (*phaseolus mungo*) a species which has a smaller yield and requires more careful cultivation, but commands a higher price and possesses a more delicate flavour. It is seldom grown except on the river *chaporis*. *Kala-mah* (*lathyrus sativus*), is grown, but not in any considerable quantities. It has a large yield, but does not fetch a high price. Pulse, like mustard, is usually grown on the river *chaporis*, but, while there is very little pulse in Gohpur, there is a certain amount of high land pulse in Balipara and Kalaigaon.

Jute is grown in small patches as a garden crop. The seeds are generally sown in April, and the plants are cut in August and September, stripped of their leaves, tied in bundles, and left to rot in pools of water for from seven to twelve days. When they are ready a handful of stems is taken up, broken in the middle, and beaten to and fro in the water, till the inner part drops out and only the fibre remains. The bundles of fibre are then dried and are ready for use ; but the area under jute is at present absolutely inconsiderable. Small patches of rhea (*boehmeria nivea*) are grown in the gardens of the fishing castes, where it is heavily manured. The skin is stripped off from the stem and the fibre separated from the

Fibres.

outer covering. The thread obtained is exceptionally strong and durable, but the difficulty of decortication has hitherto prevented the growth of rhea on a commercial scale.

**Storage and
threshing of
grain.**

In the Mangaldai subdivision the rice is threshed as soon as it has been brought from the field, but in Tezpur the stalk and ear are stored together in the granary (*bhural*). When it is required for use the sheaves are untied and spread over the courtyard. Cattle are then driven round and round over the heap of grain and straw till the ears have been finally separated from the stalk.* The grain is next passed through a sieve, and placed in a flat bamboo tray called *kula*. It is then jerked into the air and allowed to fall back into the tray, or held aloft and allowed to fall slowly to the ground, till gradually the chaff is carried off. After threshing the paddy is stored in huge drums, called *dhol*s. They are made of split bamboo, and the outer surface is plastered over with clay and cowdung

**Agricultural imple-
ments.**

The plough.

The agricultural implements in use are of a very simple character. The plough is usually made of the jack fruit tree or some other hard wood, and consists of three parts, the handle and body, which are usually all in one piece, the pole, which joins the plough at the junction of the handle and the body, and the yoke, which is merely a piece of wood, fastened by rope at right angles to the pole, with pegs affixed to it to keep it from sliding from the necks of the bullocks. The front portion of the body

* An experiment made by Mr. Darrab, Director of Land Records and Agriculture, showed that nine bullocks took 2 hours and 8 minutes to thresh out 7½ maunds of paddy.

is sharpened to a point which is shod with iron, and in soft soil a piece of bamboo is sometimes substituted for the iron. This piece of iron is the only portion of the plough which the farmer has to purchase. The rest he makes for himself. The whole instrument is suited to the wretched class of animal required to draw it. It weighs as a rule about 20 lbs. and when cattle are used the yoke seldom stands as much as 36 inches from the ground. When buffaloes are employed the whole plough is constructed on a larger scale. It is obvious that such an implement can only penetrate from three to four inches into the soil, but the wretched quality of the plough cattle prohibits the use of a more effective instrument.

The harrow (*moi*) is generally a bamboo ladder, about eight feet in length, on which a man stands as it is drawn across the field. It is used to crush the clods turned up by the plough before mustard or summer rice is sown, and to reduce the fields required for wet rice to puddle. Its place is sometimes taken by a plain log of wood. It is prepared by the cultivator himself from the bamboos growing in his garden. Clods are broken by the mallet (*doli bari*) which is also made at home. Hoes (*kor*) are used to trim the embankments (*alis*) which help to retain the water. The head is bought in the bazar and costs from Re. 1 to Re. 1-4, and is fitted with a shaft by the farmer himself. Sickles (*kachi*), with which the rice is reaped, have also to be purchased, and cost from two to four annas. In *ahu* cultivation a large wooden rake (*bindha*), with teeth nearly one foot in

Other Im-
plements.

length, is dragged over the crop by a bullock, when the plants are about six inches high. The *khanti*, a kind of trowel with a long handle, is used for weeding *ahu* rice. The sugarcane mill is described in the paragraph dealing with the preparation of molasses. The ordinary implement used for husking grain is the *dheki*, a long beam with a pestle affixed at the end, which is supported by two posts at about two-thirds of the length from the head. The shorter end is depressed by the foot, and the pestle is thus raised into the air; the weight is then removed, and the pestle falls into a small hole, in a piece of wood sunk level with the ground, in which the grain is placed. The *dheki* is the implement ordinarily employed by the Assamese to husk their rice or pulse, but the animistic tribes generally use a large wooden mortar (*ural*) and a pestle (*mari*). All of these implements are made at home.

Sugarcane. Sugarcane (*saccharum officinarum*) is propagated from the tops of the best canes, which are cut off at harvest time and kept in a shady place. One of these tops yields on the average about five canes, and, as they contain but little juice, the cultivator does not sacrifice much of the gross product of his fields in the cause of reproduction. Four principal varieties of the plant are recognized. The *bagi* or white stands about seven feet high, and has yellow canes of a soft juicy texture. The *телиа* is shorter, harder, and thinner, and the canes are a deep red or even purple colour. The *Bangala* or *Bam*, a foreign variety, is larger and more juicy than the indigenous kinds, but yields a smaller proportion off

sugar. The *Molaha* is a hard and thin variety of the *mugi*, and, where grown, is planted round the edge of the field. The land is hoed up till it is reduced to a fine tilth, and the tops planted in trenches between April and June. The patch is fenced with split bamboo, and there is usually a stout hedge of arhar dal (*cajanus Indicus*), but constant watching is required to scare away jackals and other animals, and an empty oil tin with a clapper is generally to be seen suspended over each field. While the crop is growing it is continually hoed and weeded, and about August the leaves should be tied up round each cluster of canes, which is a troublesome proceeding. The earth from the ridges is heaped about the roots to strengthen their hold upon the soil, and this process is continued until the relative positions of ridge and trench are reversed, and the canes stand upon ridges with the trenches in between.

The Tezpur tahsil and the Behali mauza are the principal centres for sugarcane. Very little cane is grown in the Mangaldai subdivision outside the Pat-harughat and Mangaldai tahsils, and not much there. Harvesting goes on from January to April.

The native form of mill is still very generally used by the Assamese for the extraction of the juice, but the iron mill, which is far more expeditious, is gradually coming into favour. The native mill consists of two wooden rollers fixed side by side in a trough hollowed out of a heavy block of wood. The tops of the two rollers pass through a hollow beam supported by uprights let through the lower block of wood into the ground, and are

Preparation
of molasses.

cut into the form of screws which fit into one another. To the larger of the two (*mota bhim* as distinguished from *maiki bhim*) is affixed a pole, which is driven round in a circle, and thus causes the rollers to revolve. The motive power is usually supplied by the villagers themselves, but buffaloes are occasionally used for the work. The mill requires rather more knowledge of carpentry for its production than the other implements of agriculture, and can only be made by the more skilful of the villagers. The cane is placed between the rollers and crushed as it is slowly forced through. Each handful is passed through the mill three or four times, till nothing but foam appears. The juice trickles from the trough into an earthen vessel, and is then transferred to a small boat scooped out of a log. When twelve or fifteen gallons have been collected boiling begins. The furnace is hollowed out of the ground, and has four circular openings to receive the cauldrons, which are made of the most durable kinds of potter's clay. Two of these vessels are placed about nine feet from the furnace mouth, and only serve to heat the juice before it is transferred into the other vessels to be boiled. When the juice has been reduced to the proper condition it is ladled into a wooden vessel (*gholani*) shaped like a small dug out, and is stirred for half an hour. As the stirring continues the liquid loses its dark brown colour, and assumes the consistency and hue of yellow mud. It is then stored in earthen pots and the process is complete.

Causes affecting productivity of land.

The fertility of the rice fields mainly depends upon the following five causes—the water-supply, the quality

of the soil, and the liability to injury from flood, wild animals, or shade. The first named factor is probably of most importance, as irrigated land in the submontane tracts yields bumper crops from poor and sandy soil. The soil of the district varies from pure sand near the Brahmaputra to clay so stiff as to be utterly unfit for cultivation. The land best suited for the growth of rice is a clay loam *alatia*, the most fertile variety of which is called *bherbheria* and is particularly deep and soft. The animals which do most injury to the crop are pigs, elephants, and monkeys. Elephants leave disastrous traces of their presence, but luckily do not remain long in any one locality. Serious damage is sometimes done by insects which are called *keonkata* or *moja*, *tupalia*, *gandhi* (*leptorisa acuta*), and *charaha* (*hispa acuesceus*). The *gandhi* is a small bug, which injures the rice plant by feeding on the stems and sucking all the sap from the young grains. It is most prevalent in July and August, and is particularly in evidence during a spell of hot dry weather. High wind and rain drive it back into the jungle, and good results are obtained by lighting fires of vegetable refuse to windward. The best remedy of all is to collect the insect by smearing a winnowing fan with some glutinous substance and brushing it over the ears of grain, when many of the bugs will be found adhering to the fan. This remedy should be tried in the morning or late afternoon, as the insects do not feed in the heat of the day. The *charaha* is a tiny beetle, which eats away the outer surface of the leaves and stalks, and thus affects the outturn of the crops. It attacks the

young plants in the nursery and can most easily be destroyed there by spraying.* Smoking the fields also produces good results, but must be continued for some days or the beetles will return. Crabs (*kekora*) sometimes damage the stems of the crop on low-lying land when under water. Rain is wanted when *sali* rice is sown and is transplanted, but is not needed for the sowing of *ahu* and *bao*. During every stage of its growth the plant is benefited by moderate showers, but rain is absolutely essential at the time when the ears are first appearing. Hail storms in December sometimes lay the crop and add materially to the cost of reaping, but fortunately are very local in their action.

Garden
crops.
The plantain.

One of the most valuable of garden crops is the plantain (*musa sapientum*). As many as ten main varieties of this tree are recognized, but the most important are those known as *athia*, *monohar*, *cheni champa*, and *malbhog*. The first two groups are again subdivided into a considerable number of different species. The commonest form of *athia* is called *bhim*, a large tree which is found growing in the garden of nearly every house. The fruit is considered cool and wholesome, and is very generally used as food for infants. The *monohar* is a somewhat smaller tree, the pulp of the fruit is white and slightly acid in taste, and is largely used in combination with soft rice and milk at village feasts. The *malbhog* and *cheni champa* are small trees whose fruit is much appreciated by Europeans. The *athia* plantain is

* The best solution is 1 lb. Paris green, 1 lb. freshly slacked lime or flour, and 150 gallons water. The solution should be kept constantly stirred and should be sprayed on with a fine sprayer.

generally grown near the homestead, where it can obtain a plentiful supply of manure, but the finer varieties are planted at a little distance to protect them from the earthworms, whose attacks they are hardly strong enough to resist. Sandy soil and heavy clay check the growth of the plant, and anything in the shape of water-logging is most injurious. The trees are planted in holes about a foot wide and eighteen inches deep, and are manured with cowdung, ashes, and sweepings. Young saplings take from eighteen months to two years to flower, and the flowers take from three to six months to turn to fruit. The plantain tree plays many parts in addition to that of fruit purveyor. The flower is much esteemed as a vegetable, the leaves serve as plates, and the trunks are used for decorative purposes on occasions of ceremony and as food for elephants. An alkaline solution distilled from the sheaths and the corm is often used as a flavouring with curry, a practice which is mentioned by the Muhammadan historians of Mir Jumla's invasion. These portions of the tree are sliced, dried, and reduced to ashes. The ashes are placed in an earthen pot in which there are several holes lightly plugged with straw. Water is then poured over them, which dissolves the alkali and trickles through the holes into the receiver below. The resulting product, which is known as *kharoni*, is used not only as a seasoning but as a hair wash and as a mordant with certain dyes.

The betelnut (*areca catechu*) is grown almost as uni-^{Other}versally as the plantain, and, with the bamboo, forms the ^{garden}great trinity of trees in which the houses of the ^{crops.}

Assamese are usually embedded. The plantation is hoed up and kept clear of weeds, and the trees are most liberally manured with cowdung. The pan vine (*piper betle*) is frequently trained up their stems, and the leaf and nut, which are invariably eaten in conjunction, are thus grown side by side. Tobacco is a plant which is to be seen growing in the majority of gardens. The seedlings are raised in carefully manured beds in August and September. At the beginning of November they are transplanted into ground which has been reduced to a fine tilth, watered for a few days, and are protected from the sun by little sections of the plantain trunk. The bed is lightly hoed up two or three times, and not more than ten or twelve leaves are allowed to grow on each plant, the remainder being picked off as they appear. The leaves are first gathered in February and March, and there is a second but much inferior crop about two months later. If required for chewing they are either dried under a shed, or else pressed into a hollow bamboo (*chunga*) and allowed to ferment. When the tobacco is destined for the pipe, though this is not the use to which it is generally put, the leaves are piled up in heaps till they ferment, cut up and mixed with molasses, and then are ready for the hookah. The commonest forms of vegetable grown are ordinary spinach *pui* (*basella alba*), *jahi*, a species of *brassica*, different kinds of arums (*kachu*), different kinds of yams (*dioscorea*) and gourds, the country bean *urahi* (*dolichos lablab*), the common mallow *lafa* (*malva verticillata*), the radish *niula* (*raphanus sativus*),

the sorrel *chuka sak* (*rumex vesicarius*), and the brinjal (*solanum melongena*).

The outturn of different crops varies according to the character of the season, and also to a great extent according to the character and level of the soil on

Yield and
value of
crops.

which they are grown. The statement in the margin shows the normal yield per acre laid down by the Agricultural Department after a long series of experiments. These figures only represent a general mean, and even in a normal year there are many fields whose outturn varies largely from the average. The yield of rice, it may be premised, is expressed in terms of husked grain. Like the outturn, the cash value of the crop can only be approximately ascertained. The prices obtained by the raiyats vary to some extent in different parts of the district, but probably average about Re.1-11-0 per maund of unhusked grain in Tezpur and Re. 1-7-0 in Mangaldai. Assuming that unhusked paddy yields 62 per cent of clean rice, it would appear that the value of the harvest from an acre of *sali* is about Rs. 33 in Tezpur and Rs. 28 in Mangaldai, while the value of the *ahu* crop is Rs. 28 or Rs. 24, according as it is raised in the eastern or western subdivision. For mustard the villagers generally get about Rs. 3-4 a maund, so that the yield from one acre is worth about Rs. 19-8-0. The price of molasses varies considerably from time to time and from place to place, and ranges from Rs. 5 to Rs. 10 per maund. The value of the yield of an acre of cane ranges accordingly from about Rs. 110 to Rs. 220.

**Floods and
irrigation.**

A considerable portion of the district is flooded in the rainy season by the Brahmaputra and its tributaries. The pressure on the soil is, however, very light, and there is no necessity at present to bring these submerged tracts under permanent cultivation. The Bhareli ruined a considerable area of good rice land when it changed its course some years ago, and the Gabharu, Dhansiri, Rowta, and Nanai all occasionally do a certain amount of damage. No protective works have yet been erected, but there is not as yet sufficient demand for land to render reclamation necessary. The Kacharis in the submontane mauzas combine together to dig little channels (*dorogs*) through which they bring the water of the rivers on to their rice fields.

**General
Remarks.**

Beyond occasionally selecting the best ears of grain for seed the villagers do little to improve the quality of their crops, and show little tendency to adopt new staples. Manure is seldom used except for sugarcane and garden crops, and to some extent for tea. Experiments in agriculture on a scientific scale have, however, been made by several gentlemen in Tezpur. Mr. Moti Lal Holdar, the manager of the Mornai Tea Estate, was very successful in raising different varieties of cotton, sugarcane, and tobacco. Mr. Wilde, the manager of the Bamgaon Tea Estate, opened a farm at Gamiri in 1903, and in 1905 had about 350 acres under cultivation. The crops raised included paddy, jute, khesari and mung dal, mustard, ground nut, ginger, turmeric, barley, oats, wheat, potatoes, tobacco, coriander and anise. Agricultural implements of English manufac-

ture have been successfully and economically worked upon this farm, notably a threshing machine and large ploughs. Agricultural experiments have also been made by Babu Syama Charan Moitra, a local pleader, who in 1905 had about 50 acres under cultivation.

The buffaloes of the district belong to three distinct breeds, the Assamese, Nepalese, and Bengali.* The Assamese are the largest of the three, and are fine upstanding animals with widely spreading horns. During the cold weather they are generally grazed in jungly tracts, and a wild bull often attaches himself to the herd, and becomes the sire of many of the calves. This continual infusion of a good strain of blood does much to maintain the excellence of the breed. The Bengali buffalo is a smaller and less imposing animal, and does not command so high a price. Nepalese buffaloes are also common. They are large animals but have smaller horns and longer tails than the Assamese variety. Assamese bulls cost from Rs. 30 to Rs. 40, and cows from Rs. 40 to Rs. 60, but a Bengali buffalo can be purchased for rather less.

Buffaloes rarely get anything but grass and a little salt to eat. In the cultivated portion of the district they are usually placed in charge of a small half naked boy, whose legs can hardly stretch across the massive back of the animal he bestrides and who guides it with a nose rope. In the *chaporis* the herd is driven out to graze in the jungle, and follows the lead of the older cows, whose whereabouts is indicated by the metal or

* The information given in these paragraphs is taken from a note compiled by Mr. Darrah, Director of Land Records and Agriculture in 1887, and from reports received from the local Revenue Officers of Darrang.

wooden bells that are dangling from their necks. They are often trusted to return in the evening of their own accord, and a long line of animals is sometimes to be seen swimming across a channel of the Brahmaputra which separates them from the huts in which the graziers live. Often too, as the sun is setting, a herdsman is to be seen climbing a simul tree, which raises its head above the surrounding wastes of grass, to call his buffaloes home. At night each animal is fastened by a nose rope to a post and sleeps on the bare ground. There are a large number of *mokhutis*, as these grazing camps are called, in the flooded tracts along the Brahmaputra, and on the high land near the hills. A cow is said to remain in milk for about ten months, and yields at the beginning from two to four seers every day. The amount gradually decreases till a month or so before the next calf comes, when it ceases altogether. The milk is very white and rich in fatty materials, and consequently yields a large proportion of *ghi*. The cows are said to begin breeding when three years old, and to continue doing so for fifteen years, during which time they give birth on the average to about ten calves. The normal life of a buffalo is from 25 to 30 years. Age is judged by the incisor teeth.

Cattle.

Half-starved, under-sized, ill-bred, and not unfrequently diseased, the Assamese cattle are but sorry creatures. The bullocks find it a difficult task to drag even the light native plough, and the cows yield but a minimum of milk. The causes of this degeneracy are not entirely clear, but are probably to be found in a total

indifference to laws of breeding, in absolute neglect, and partly perhaps in the want of suitable fodder in the rains. No bulls are set aside to be the sires of the herd, and the cows are generally covered by a young and immature animal, who secures the object of his desires by his superior lightness and agility. The sire is often closely related to the dam, and she in her turn has had her strength exhausted by being covered when herself little more than a calf, and by subsequent breeding without the smallest intermission. The cattle are never groomed, and, when an epidemic breaks out, no attempt is made to isolate the sick. Everything, as Mr. Darrah says, is left to nature, from the moment when the most active, and therefore probably the youngest, bull of the herd has succeeded in covering a cow, until the progeny, after years of work and semi-starvation, dies neglected in some unfrequented jungle. Cows generally cost from Rs. 10 to Rs. 15, and bullocks from Rs. 15 to Rs. 30. The Bhutias bring down very fine cattle in the cold weather, but they are seldom purchased by the villagers in the neighbourhood, and it is said that they do not stand the heat well.

Live stock are generally grazed on the rice *pathars* **Grazing grounds.** after the crop has been carried, on high land, and in swamps and marshes till the water rises. During the rains, the villagers are said to experience some difficulty in obtaining fodder for their cattle in parts of the Māngaldai, Patharughat, and Tezpur tahsils, and rice straw is sometimes collected for the purpose.

Goats and sheep and ponies.

The goats are almost as degenerate as the cattle. They yield but little milk, the whole of which is taken by the kids, and are only kept for food or sacrifice. At night they are usually shut up in a small out-house with a raised floor, which is approached by a slanting board or sloping bamboo platform as a protection against jackals. There is no indigenous breed of sheep, and though sheep are brought down by the Bhutias in the cold weather, very few seem to remain on in the district. The country ponies are, if anything, even more miserable specimens than the cattle. Few of them are as much as twelve hands in height, and they possess neither pace, endurance or stamina. The Bhutia ponies are, however, hardy little animals, though they have neither pace nor manners. European residents are compelled to obtain all their horseflesh from Calcutta.

A census of livestock was taken in 1904, and disclosed the following results. Bulls and bullocks, 90,000 ; cows, 82,000 ; bull buffaloes, 19,000 ; cow buffaloes, 13,000 ; young stock, 93,000 ; sheep, 150 ; goats, 59,000 ; horses and ponies, 845.

Cattle disease.

The most common forms of cattle disease are foot and mouth disease (*chapku*), rinderpest (*guti*), a disease called *kachua*, the principal symptoms of which are flatulence and diarrhoea, cholera (*marki*), *matikhua*, the first symptom of which is, as the name implies, the eating of earth followed by dysentery, and *sukuna* when the animal refuses to eat and dies after ten days or a fortnight.

Commencement of tea industry.

Reference must now be made to tea, a crop which has done so much for the development of Darrang.

The indigenous tea of Assam was first brought to the notice of Government in 1826 by Mr. C. A. Bruce, a gentleman who had been engaged in trade in the Province while it was still under native rule, and who had been sent up the Brahmaputra in command of a division of gun boats in 1824. In 1834, a committee was appointed by Government to enquire into the possibility of cultivating tea on a commercial scale, who deputed three of their numbers, Drs. Wallich, McClelland, and Griffiths, to visit Upper Assam. Nurseries were established, a small establishment was entertained under the general management of Mr. Bruce to search the jungles for plots of indigenous tea, and cultivate them when discovered, and plants and seed were brought to Assam from China. Tea makers and trained Chinese were imported in 1837, and in the following year some of the manufactured product was sent to England, where it met with a most favourable reception. Assam tea was regarded as a curiosity, and the first eight chests which were put up to auction fetched sums which at the present day seem little short of fabulous, the prices paid ranging from 16s. to £1-14-0 a pound. These were, however, only fancy prices, and a short time afterwards a merchant offered to purchase tea in considerable quantities at prices ranging from 1-10½d. to 2s. a pound.*

* Information with regard to the early history of the tea industry has been derived from—

- (1) Selections from the Records of the Government of Bengal No. xxxvii. Papers relating to Tea cultivation in Assam. Calcutta, 1861.
- (2) Report of the Commissioners appointed to inquire into the state and prospects of Tea cultivation in Assam, Cachar and Sylhet. Calcutta, 1868.
- (3) Papers regarding the Tea Industry in Bengal. Calcutta, 1873.

**The boom
in the early
sixties.**

The pioneer of tea in Darrang was a Mr. Martin, who opened a plantation at Balipara in 1854, and three years later started a garden at Haleswar. In 1855, the Assam Company started operations at Singri Parbat, and these were the only plantations in existence when Captain Comber submitted his report in 1859. The next four years were a period of steady but not abnormal or unwholesome expansion. About 1863, the possibility of making large fortunes out of tea attracted the attention of the speculating classes, and tea planting passed through a severe crisis, which was entirely due to the action of company promoters, who endeavoured to make money, not by manufacturing tea, but by hastily opening gardens to sell at most exorbitant prices to the credulous investor. The promulgation of the fee simple rules of 1861 was followed by a rush for land, which was aggravated by the orders of the Board of Revenue, who authorized District Officers to sell estates on a pen and ink sketch made by the applicant, before they had been properly surveyed and demarcated. Land thus obtained was hastily cleared of jungle, a few plants, the majority of which soon died, were hurriedly put out, and the place was sold to the unsuspecting public as a flourishing tea garden. To such a pitch was this procedure carried that there is one case on record, in which a manager received instruction from London, to clear and plant a certain area of waste land for delivery to a Company to whom it had been already sold as a tea plantation.

**Scarcity of
labour.**

Many of the planters, and some District Officers in Assam, thought that it was the duty of Government to

stimulate the slothful Assamese, and drive them to work on the plantations, by enhancing the land revenue assessment. This point of view did not commend itself to the Commissioner. Colonel Jenkins, who, while admitting that there was great want of industry and energy amongst the Assamese, declined to check their social improvement, or to reduce them to the unaccustomed misery of hard work, simply to provide the planters with cheap and abundant labour.*

It naturally followed that in spite of the high prices offered, local labour was not obtainable in sufficient quantities, and coolies, generally of the most miserable description, were sent up from Calcutta. The mortality in the depôts and on the journeys was appalling. In the four years, 1864 to 1867, the annual mortality in the largest dépôt ranged from 36 to 115 per cent of the average daily strength, the latter enormous rate being calculated on a daily average of no less than 458 souls.† Between 1863 and 1868, 54,352 coolies were imported to Assam, 1,712 of whom died *en route*. Even when the garden was reached the mortality was generally high, and was sometimes quite appalling. In the Report of the Commissioners appointed to enquire into the state and prospects of tea cultivation details are given for seven gardens in Upper Assam, on which the recorded mortality for half the year in 1865 ranged from 16 to 39 per cent.

* Letter No. 111, dated 24th October 1859.

† Report of the Commissioners, p. 28.

The returns submitted were declared by the Commissioners to be unsatisfactory, but in 1866, 4,366 deaths were recorded in Upper Assam, which was equivalent to a death-rate of 17·9 per cent on the total number remaining plus the total number of deaths. These days of high mortality have happily now passed away, and in 1902-03 the mortality amongst adult coolies in Darrang was only 39 per mille. It may, perhaps, be thought that even this is a high death rate for a population of adults, and in comparison with those recorded in England this is no doubt the case. But comparisons of this sort are most misleading, as though the death rate in Assam is very imperfectly recorded it is certain that it largely exceeds the rate for the more civilized countries of Western Europe. It must, moreover, be borne in mind that many of the coolies are recruited from the ranks of the physically unfit, that they suffer from the effects of a change of climate, and that when working in new clearances they are exposed to especially unfavourable conditions. The Commissioners* in 1868 considered that the Bhutan field force furnished a fair analogy to garden coolies, and pointed out that the death rate amongst that force was 16 per cent, or very little less than the death rate even in those days on Assam tea gardens. The planters spare neither trouble nor expense in their efforts to preserve the health of their employees, and many of the weakly ones who die would probably have lived no longer had they been allowed to remain in their own homes.

* Page 56 of their report.

During the tea boom, large sums were paid for labour and for seed, land which was little better than jungle was sold for preposterous prices, and the tea companies which were formed under these unfavourable conditions soon collapsed: 1866, 1867, and 1868 were years of great depression. Mr. A. C. Campbell, in a note written in 1873, describes how young men, who had been engaged in England, were turned adrift when the collapse came "in a most inhospitable country without a penny or a friend; some died, others had literally to beg their way out of Assam, most had to regret impaired constitutions, and all the loss of some of the best years of their life. In 1869, affairs began to take a more favourable turn. It was seen that properly managed gardens could be worked at a satisfactory profit, and that the estates of the bubble companies which had been bought for small prices after the great crash were doing well in the hands of their new owners. Since 1870, there has been an enormous expansion of the industry, and while the area under cultivation and the outturn have alike increased, the cost of production and the price obtained have steadily diminished. Like other industries, tea has experienced periods of prosperity and depression, but there has been no such boom with its inevitable collapse as occurred in the early sixties.

The first tea garden was opened in Darrang in 1854, but for some years the industry did not make very rapid progress. In 1870, the total outturn of manufactured tea was said to be 721,000 lbs., but little weight can be attached to these early estimates of outturn, as two years later it

**Collapse in
1866.**

**Expansion
of the in-
dustry.**

was said to be nearly 1,500,000 lbs. In 1882, the total area under plant was 14,289 acres with a yield of 4,356,000 lbs. Six years later the acreage had risen to 20,000 and the reported yield had nearly doubled. The industry continued to make steady progress till 1896 when there were 31,867 acres under tea with a total outturn of 11,474,000 lbs. Tea was at that time booming, and many of the owners of the excellent private gardens round Tezpur took advantage of this opportunity to sell out to joint stock companies. The extra capital obtained was employed in the extension of the cultivated area, and within the short space of three years the area under plant increased by nearly 9,000 acres. In 1900, the outturn of manufactured tea was reported to be 15,311,000 lbs., and the area under plant 41,708 acres. Since that date the industry has been passing through a period of depression, which was chiefly due to the abnormally rapid expansion of the outturn, to the large increase in the duty imposed in England, and to the difficulty in obtaining labour. Statistics for later years will be found in Table VII.

**Labour
supply.**

The Kacharis of Kamrup and Mangaldai are employed on the plantations in considerable numbers, but the bulk of the labour force is imported from other parts of India. During the ten years ending with 1890, 38,660 persons were brought up to the gardens and the total for the next decade was 79,924. 1896 (10,183), 1897 (12,464), and 1900 (11,358), were the years in which the largest numbers were imported. Statistics for later years will be found in the Appendix.

The journey from the recruiting districts is trouble-
 some and expensive, the class of persons capable of
 working successfully in the damp climate of Assam is
 limited, and of recent years the supply of labour avail-
 able has not been sufficient to satisfy the requirements
 of the planters. Special Acts have been passed to re-
 gulate the relations between the employers and their
 labour force. Careful provision is made for the welfare
 of the coolie. He is housed in neat and comfortable
 lines, he is provided with an excellent water-supply,
 generally drawn from masonry wells, and, when sick, he
 is cared for in a comfortable hospital by a native doctor
 working under the supervision of a European medical
 man. The provision of all these comforts and the im-
 portation of the labourers themselves cost large sums
 of money, which no one would be willing to expend
 without some guarantee that the coolies when imported
 would consent to remain on the plantation. This pro-
 tection is afforded by the law (Act VI of 1901), which
 lays down that a labourer, provided that he is well
 treated, must not leave the garden to which he is in-
 dentured before the expiry of his contract, unless he
 chooses to redeem it by a money payment. The simpler
 Act (XIII of 1859), which empowers a Magistrate to

The
labourers.

order a labourer who has taken an advance to complete the work on account of which the advance was given, is also very generally used.

**Site of tea
gardens.**

Some of the best plantations are situated on what is known as the high bank, a ridge of reddish loam, which runs from Sessa about eight miles north of Tezpur to Balipara. Other good estates have been carved out of the dense forest which lies near the foot of the Aka Hills, a little to the north of Barjuli. East of the Bhareli there are a considerable number of gardens occupying the central belt of land between the Brahmaputra and the hills. Tea in Mangaldai falls into two main groups. The older gardens are situated in the neighbourhood of Kalaigaon, while of recent years a considerable number of plantations have been opened on the high land at the foot of the hills, to the west of Bengbari church.

Further information with regard to the area, size and population of each garden in the district will be found in Appendix A.

**Soil
required
or tea.**

A friable red loam is the soil that proves most suitable for tea. The plant requires a heavy rainfall, but anything in the shape of waterlogging is most prejudicial to its growth, and gardens should only be planted out on land which can be well drained. Land which in its natural state is covered with tree forest is usually considered the most suitable, as the absence of timber generally shows either that the place is liable to flood, or that the soil is sandy, or that the rainfall is deficient.

Four distinct varieties of wild tea are recognized. **Varieties of plants.** Assam indigenous, which has a leaf from 6 to $7\frac{3}{4}$ inches in length by $2\frac{3}{8}$ to $2\frac{1}{8}$ inches in width, the Manipur or Burma indigenous with a larger, darker, and coarser leaf than the preceding variety, Lushai or Cachar indigenous, whose mature leaf is from 12 to 14 inches long, and from 6 to $7\frac{1}{2}$ inches wide, and the Naga indigenous which has a long and narrow leaf. In addition to these four varieties there is the China plant, and different kinds of hybrids. The China tea is a squat and bushy shrub with small leaves, which gives a lower yield per acre than the other kinds. It is many years since China seed was planted out in new clearances, and considerable areas covered by this plant have been abandoned. In its natural state the indigenous plant attains to the dimensions of a tree, varying from 20 to 50 feet in height, though its girth seldom exceeds two feet. It has a vigorous growth and yields a large outturn of fine flavoured tea, but is delicate when young. Of the hybrid variety there are many qualities ranging from nearly pure indigenous to nearly pure China. A plant with a very small admixture of China is usually preferred, as this imparts the hardiness, the want of which is the one defect in the indigenous variety. During the boom in the nineties the price of good tea seed rose to as much as Rs. 150 per maund, but this was followed by a slump, when but a third of that sum became obtainable. Seed from the Ghoirali, Barjuli, and Namgaon estates is much esteemed.

**System of
cultivation.**

The seed is planted in nursery beds in December and January and kept under shade till the young plants are three or four inches above the ground. Transplanting goes on between April and July, whenever there is rain, the plants being usually placed from four to five feet apart. During the first two years of their life little more is required than to keep the plantation clear of weeds. By this time the plants are from two to four feet high, and at the end of the rains they are pruned down to fifteen inches or a foot to encourage lateral growth. In the third year the plant can be lightly plucked over, but the yield of leaf is small. Pruning is continued every year. Only about two inches are left of the wood formed since the previous pruning, and any unhealthy or stunted branches are removed. As an extreme remedy old plants, in which there is a large proportion of gnarled and twisted wood, are sawn off level with the ground, and fresh shoots are allowed to spring from the root itself. During the rains the garden is hoed over several times, in order to render the soil permeable both to rain water and the roots of the bush. At the end of the rains, the ground is hoed up to the depth of eight or nine inches. The object of this is to protect the land from drought, as the hoed up soil prevents the evaporation of water from the lower strata. It also adds to the fertility of the land by exposing it to air, light, and changes in temperature. Manure has hitherto been little used. Oil cake and cowdung are sometimes spread about the plants, and exhausted land is sometimes top-dressed with rich soil from a neigh-

bouring marsh. The cost of these operations is considerable and they are not invariably successful from the pecuniary point of view. Matikalai (*phaseolus mungo radiatus*) is often sown amongst the bushes and hoed in as a green manure.

Plucking begins in April, and is continued till the beginning of December. The bud and the two top leaves are taken from each shoot, but fresh leaves soon appear, and in about five weeks' time the shoot is ready to be plucked again. This throwing out of new leaves is termed a "flush," and there are usually eight to ten full "flushes" in a season, though each bush is picked over every ten days or so, as the twigs develop at different times. The plucking is usually done by women and children, while the men are engaged in hoeing up the ground around the plants. The plant is liable to be attacked by a large number of pests, the best known being the tea mosquito or blight, the green fly, and the red spider. A full account of these pests will be found in "The pests and blights of the tea plant," by Watt and Mann, Calcutta, 1903.

When the leaf has been taken to the factory it is spread out in thin layers on trays and allowed to wither. In fine weather the process takes about 18 hours, but if it is cold and wet as many as 48 hours may elapse before the leaf is ready. When the leaf has been properly withered it is placed in the rolling machines. The object of rolling is to break up the cellular matter and liberate the juices, and to give a twist to the leaf. Rolling takes about one hour, and after this the leaf is

**System of
manufac-
ture.**

placed in a cool room for about three hours to ferment. It is then placed on trays in the firing machines through which hot air is driven, until the last trace of moisture has been expelled, and the tea is crisp to the touch. The leaf is then passed through sieves of varying degrees of fineness, and the tea sorted into different grades. The best and most expensive quality is called Broken Orange Pekoe, and is made from the bud or tip, which contains all the good qualities of tea in a more concentrated form than any of the other leaves, is stronger, and has a more delicate flavour. The other grades, which are differentiated by the size of the mesh through which they pass are Orange Pekoe, Broken Pekoe, Pekoe, Souchong, and Fannings.

After the tea has been sorted, it is fired once more to remove any moisture it may have absorbed from the surrounding atmosphere, and is packed in lead lined boxes while it is still warm. Tea loses largely in weight during the process of manufacture, and about four pounds of green leaf are required to produce one pound of the finished article.

**Outturn
and prices.**

The character of the outturn depends largely upon the season, but still more upon the garden and the system of manufacture followed. In 1868, the Commissioners estimated that the average outturn was about 240 lbs. per acre, but this estimate was probably too low, as the average yield in Darrang during the five years ending with 1903 was over 400 lbs. per acre. The introduction of machinery, and the improvement of the systems

of cultivation and management have rendered it possible to effect a large reduction in the cost of the tea when placed upon the market. In 1868, it was calculated that tea must be sold at 2s. a lb. to yield a profit. Twenty years later the average price obtained by tea from the Brahmaputra Valley was 8 annas 2 pies; and, though in 1894 it rose to 10 annas 5 pies, in 1898 it dropped to 6 annas 9 pies, and has since remained below that figure.

The forests of Darrang fall into two main classes, the **Forests.** reserved forests, which in 1902-03 covered an area of 321 square miles, and the unclassified State forests, which, in the same year, occupied the enormous area of 2,127 square miles. Unclassified State forest is, however, simply Government waste land, and does not necessarily possess any of the characteristics which are usually associated with the expression forest. It may be a sandy *chur* or a huge expanse of low-lying land covered with high grass and reeds, and almost totally destitute of trees. It may be a small piece of arable land, which has been resigned by its former holder and has not yet been settled with any other person, or it may be, what its name would naturally suggest, *i.e.*, actual tree forest. It is impossible to give even the roughest estimate of the proportion of unclassified State forest which is actually under timber, but where the total area is so enormous it is obvious that, in a country with a heavy rainfall like Assam, the area covered with trees must be considerable.

The general control of the Government forests is entrusted to a Deputy or Assistant Conservator. The unclassified State forests are, however, under the immediate **System of management.**

management of the local revenue officials, and the villagers are allowed to remove all the forest produce needed for their own requirements free of royalty.

**The re-
served
forests.**

There are altogether seven reserved forests in Darrang, but three of them are only a few acres in extent. The Charduar, Balipara, and Nowduar reserves are a compact mass of evergreen forest, which covers an area of 291 square miles at the foot of the hills on either side of the Bhareli river. The Khalingduar forest is situated in the north of the Mangaldai subdivision, and is 27 square miles in area. From Table VIII it will be seen that the revenue derived from these reserves is very small, except in the case of the Charduar forest, where the receipts are swollen by the inclusion of the gross receipts from the rubber plantation. The greater part of the reserves are evergreen forest which does not require to be protected from fire. Special measures are, however, taken for the protection of the khair forest in the Khalingduar, and the patches of sal near Tezpur, and from Table IX it will be seen that the efforts of the Department are generally crowned with success. The statement appended to this chapter gives further details with regard to each of the principal reserves.

**Timber
trees.**

The most valuable timber trees in the district are *Sam* (*artocarpus chaplashu*), *Gunserai* (*cinnamomum glanduliferum*), *Titasapa* (*michelia champaca*), *Makai* (*shorea assamica*), *Hollock* (*terminalia bicolorata*), *Simul* (*bombax malabaricum*), *Poma* (*cedrela toona*), *Khakan* (*duabanga soneratioides*), *Bola* (*morus laevigata*), *Sal* (*shorea robusta*), *Nahor* (*mesua ferrea*), *Khair* (*acacia catechu*), *Ajhar*

(*lagerstraemia reginae*), *Kathal* (*artocarpus integrifolia*), *Sonalu* (*cassia fistula*), *Gomari* (*gmelina arborea*) and *Uriam* (*bischoffia javanica*). They are used for posts, planks, scantlings, and sleepers, but the timber trade of Darrang is at present unimportant. There is one saw mill at Tezpur which converts simul into tea boxes, but hitherto very little timber has been exported from the district.

The bulk of the forest revenue is derived from the duty **Rubber.** on imported rubber, or from the price obtained for the rubber tapped in the Government plantation at Charduar. The right to tap rubber in the unclassified State forests in the district is put up to auction, and, till a few years ago, was frequently knocked down for a considerable sum. as, by custom, the purchaser was granted an exclusive monopoly of sending rubber tappers across the Inner Line into the Aka and the Dafla Hills. Experience showed that this system was liable to give rise to friction, and the issue of passes has been discontinued, the hill-men being left to tap their rubber and bring it down themselves. The Charduar rubber plantation was started in 1873, and in 1903 had cost altogether over Rs.2,17,000. Tapping was first begun on a considerable scale in 1899, and the receipts under this head in 1903 amounted to Rs.13,700. The area under rubber in that year was 2,862 acres. The tree can either be raised from seed or suckers. From June to September is the best time to sow the seed. When the seedlings are about two inches high they are transferred from the seed boxes to the nurseries. Here they are kept till the following rains, when they are moved again to well stockaded nurseries, where they are

allowed to remain for two or three years till the plant is ten feet high. They are then put out in the forest on mounds about four feet high. The young rubber tree is readily devoured by every kind of game, and so cannot be planted out till it has attained a considerable growth. When suckers are taken a strip of bark about two inches wide is removed from a healthy branch, and the place plaistered thickly over with clay, which has to be kept moist. By the end of two months roots will have been thrown out into the clay, and the branch can then be cut off and planted.

Reserved Forests more than ten square miles in area.

Name.	Situation and character of soil.	Area in sq. miles.	Date when constituted a reserve.	Name of valuable timber trees.	Route of extraction.
Balipara ...	Manza Balipara. One-half plain and one-fourth hilly containing mixed forest; one-fourth swampy covered with evergreen forest.	88	1878	Sal, nahor, ajhar, sam, gunserai, bola, makai, khakan.	Bhareli and Mansiri rivers, Tezpur-Balipara Railway.
Charduar ...	Mauzas Balipara and Bargong, swampy, plain.	121	1878	Nahor, ajhar, sam, gunserai, bola, makai, poma, gomari.	Belsiri, Mansiri, Gabharu and Dipota rivers, Tezpur-Balipara Railway.
Nowduar ...	Manza Bokola. One-half plain covered with mixed; one-half swampy covered with evergreen forest.	82	1878	Khakan, sam, poma, gunserai, makai, gomari, uriam, khair, sonaru.	Bhareli and Dikrai rivers.
Khalingduar ...	One-fourth grass land with a few khair trees, one-sixth hilly with mixed forest, one-eighth swampy, the remainder evergreen forest.	27	1878	Makai, khair, gunserai, titasapa, sida, poma, paroli and karai.	

CHAPTER V. INDUSTRIES.

Arts and industries—Silk weaving—Pottery—Brass and bellmetal—
Lac—Mat-making—Fishing.

**Tea the
only im-
portant
industry in
Darrang.**

Apart from tea the industries of Darrang are unimportant. Much of the clothing worn by the indigenous inhabitants is still woven by the women of the family, and a certain amount of lac, and of silk, especially of *eri* silk, is produced. A few foreigners express mustard oil with the bullock mill of Upper India, and there are a few blacksmiths, makers of earthenware, and metal utensils. Near Tezpur there is a sawmill under European management. In the following paragraphs is given a short account of such industries as exist

Pat silk.

Three different kinds of silk are produced in the district. The most valuable kind is known as *pat*, and is obtained from the cocoon of two species of worms, the univoltine or *bar polu* (*bombyx textor*) and the multivoltine or *saru polu* (*bombyx croesi*). Both kinds are reared indoors on the leaves of the mulberry tree (*morus indica*) or where mulberry is not obtainable, on the *panchapa*. The silk can be most easily obtained either at Becheria and Bihuguri in Tezpur, or at Sipajhar and other places in the Patharughat tahsil in Mangaldai. The eggs of the *bar polu* take ten months to hatch, the worms usually making their appearance about the beginning of January.

The life of the worm lasts from thirty to forty days, and the cocoon takes about six days to spin. The cocoons are of a bright yellow colour, but the silk, when boiled in potash water, become perfectly white. From twelve to fifteen thousand cocoons are required to yield one pound of thread, which is worth from Rs. 8 to Rs. 12. The thread obtained from the *saru polu* is not so valuable as that of the *bombyx textor*, but as the worm yields four broods in the year it finds greater favour with the cultivators. *Pat* silk is, however, only made to order and the total quantity produced is very small.

Several causes combine to make this silk rare and expensive. The Jugis are the only caste who will consent to rear the worm, and, as the insect is looked upon as impure, the industry is probably regarded with disfavour even by the Jugis. The supply of mulberry leaf is limited, and the worms are very delicate, a large number of them dying before they spin.

The *muga* worm (*antheraea assamensis*) is generally ~~Muga~~ fed on the *sum* tree (*machilus odoratissima*). Five different broods are distinguished by vernacular names, but in the Darrang district the only broods commonly reared are the *katia* in October—November, the *jarua* in December—February, and the *jethua* in the spring. The complete cycle of the insect lasts from 54 to 81 days, the bulk of which is occupied by the life of the worm. When the moths hatch out the females are at once attached to straws which are hung up inside the house, and are visited by the males who are allowed to remain at liberty. Each female produces about 250 eggs which are placed

in a dark place, and when the worms appear they are at once transferred to the *sum* tree. A band of straw or plantain leaves is fastened round the trunk to prevent them from descending, and during the night they take shelter under the leaves. Constant vigilance is, however, required to keep off crows, kites, owls, large bats and other pests which prey upon the worm, and hail and heavy rain not unfrequently do damage. When fully grown the worm is about 5 inches long and nearly as thick as the forefinger. In colour it is green with a brown and yellow stripe extending down each side, while red moles with bright gold bases are dotted about the surface of the body. When the worms are ready to spin they descend the tree and are then removed to the house. Most Assamese women possess one or more garments of *muga* silk, and well-to-do men wear waistcloths of this material on occasions of ceremony. *Muga* silk is chiefly manufactured for home use and very little is produced for sale. The silk is reeled from the cocoon, 250 of them yielding one oz. of thread. The price obtained is from 4 to 6 annas per oz.

Eri silk.

The *eri* worm (*attacus ricini*) derives its name from the *eri* or castor oil plant (*ricinus communis*) on which it is usually fed. Patches of this plant are to be seen in the gardens of most villagers and the worm is proportionately common. From five to six broods are usually reared in the year, those which spin their cocoons in November, February, and May yielding most silk. As with the *muga* moth, the females, when they emerge, are tied to pieces of reed, and are visited by the males who

are left at liberty. The eggs are hatched in the house and take from a week to 15 days to mature. As soon as the worms appear they are placed on a tray, which is suspended in a place of safety, and fed on the leaves of the castor oil plant. When fully grown they are about $3\frac{1}{2}$ inches long and of a dirty white or green colour. After the final moulting, the worms are transferred from the tray to forked twigs suspended across a piece of reed, and, when they are ready to spin, are placed on a bundle of dried plantain leaves or withered branches which is hung from the roof of the hut. The matrix of the cocoon is very gummy, and the silk, which is of a dirty white colour, has to be spun not reeled off. Before this is done the cocoons are softened by boiling them in water and a solution of alkali. Empty cocoons yield about three quarters of their weight in thread.

Eri cloth is produced in every part of the district, but the great centre of the industry is the Kachari country in the north of Mangaldai. Kalaigaon is a market at which considerable quantities of this useful commodity are on sale.

The most useful garment made of *eri* silk is the *bar kapor*, a large sheet sometimes as much as 20 feet in length by 5 feet wide, which is folded and used as a wrap in the cold weather. It costs from Rs. 10 to Rs. 16. *Eri* cloth is also made into coats and petticoats. Women's clothes, both petticoats and the shawls worn over the bust, are, however, usually made of *muga* silk, the thread required for a complete dress costing from Rs. 5 to

Cost of silk
clothes.

Rs. 7. The instruments used for twisting and weaving silk are the same as those employed for cotton, but for *eri* thread a stronger reed is employed.

Weaving.

The weaving of cotton cloths is carried on by rich and poor alike, and one or more looms are to be seen in the courtyard of almost every house. Though cotton is grown in the hills of the Province, and though many different dyes are to be found growing in its forests, imported yarn, which is supplied in the requisite shades by the village shop-keeper, is usually employed. The loom consists of four stout posts which are driven into the ground so as to make a rectangle about 5'10" x 2'6", and are joined together at the top by cross beams. The implements required for the conversion of raw cotton into cloth, and the system of manufacture followed are described in the minutest detail in a "Monograph on the Cotton Fabrics of Assam," published by the Superintendent of Government Printing at Calcutta in 1897. Descriptions of mechanical processes of this nature are, however, at their best unsatisfactory, and are hardly intelligible without a series of diagrams. The total cost of the whole apparatus is from ten to fifteen rupees, and as weaving only occupies the leisure moments of the women, the use of home-made clothing helps to save the pocket of the villager. Very little cotton cloth is prepared for sale, and there can be little doubt that weaving as an industry is commercially a failure, the price obtained for the finished article being out of all proportion to the time expended on its production. The principal articles made are *gamchas* or napkins, often worn on the head,

large sheets or shawls worn as wraps, called *chadar khamin* or *bar kapor*, and smaller shawls called *chelengs*. A kind of shawl called *paridia kapor* is very finely made and is enriched with a beautifully embroidered border. It costs sometimes as much as Rs. 200.

The earth used is generally a glutinous clay, which **Pottery.** is well moistened with water and freed from all extraneous substances. If it is too stiff some clean coarse sand is worked up with it. A well kneaded lump of clay is then placed on the wheel, which is fixed horizontally and made to rotate rapidly. As the wheel revolves the potter works the clay with his fingers and gives it the desired shape. The vessel is then sun dried, placed in a mould, and beaten into final shape with a mallet, a smooth stone being held the while against the inner surface. It is then again sun dried, the surface is polished, and it is ready for the kiln. The collection of the clay and firewood, the shaping of the utensils on the wheel and the stacking of them in the kiln, form the men's portion of the work. The women do the polishing and the final shaping. The Hiras, however, do not use the wheel, but mould the vessel on a board, laying on the clay in strips, and the whole of this work is entrusted to the women.

The instruments employed are—the wheel (*chak*) which is about three feet in diameter and rotates on a piece of hard pointed wood fixed firmly in the ground, the mould (*athali*) a hollow basin about 16 inches long by 3½ inches deep, the mallet (*baliya piteni*), and the polisher (*chaki*).

The principal articles manufactured are cooking pots (*akathiah* and *khola*, *daskathia*, *charu*, and *satar*), water jars (*kalah* and *tekeli*), vessels in which rice is boiled (*tholi*), and larger vessels (*hari* and *jaka*) with lamps, pipes, and drums. The profits of the business are said to be small, and the local pottery is being gradually ousted by a superior quality of goods imported from Bengal, and by metal utensils which are coming extensively into use. The principal centres of the industry are at Tezpur, Chutia, Bishnath, Becheria and Haleswar, and at Salmara in Mangaldai, but there are not more than six or seven hundred persons in the district entirely supported by the potters' craft.

Brass and
bell-metal.

The brass and metal industry is not of much importance. Bell-metal utensils are cast in moulds, but brass vessels are made out of thin sheets of that metal which are beaten out and pieced together. The implements of the trade consist of anvils of different sizes (*helmuri chatuli*), hammers, pincers, and chisels. The furnace is simply a hollow in the floor of the hut, and the bellows are made of goat's skin. When it is desired to join two sheets of brass together, nicks are cut in one edge, into which the other edge is fitted, and the two are then beaten flat. A rough paste made of *pan*, a substance which consists of three parts of sheet brass with one part of solder, and borax is then smeared over the join. The metal is heated, the *pan* melts, and the union is complete. The principal articles manufactured are small flattish bowls often used as drinking cups (*lota*, *bati*), jars for holding water (*kalsi*, *gagari*), trays (*saria*), boxes to

carry betelnut and lime (*tema, temi*), and large vessels used for boiling rice (*thali*). The chief centres of the industry are in the Chutia tahsil, the Becheria, Modopi and Bihuguri mauzas, and the Mangaldai and Patharughat tahsils. The number of braziers is, however, very small, and of workers in bell-metal smaller still.

Lac is reared on various members of the *ficus* family **Lac.** on arhar (*cajanus Indicus*) and the castor oil plant (*ricinus communis*), but the trees most generally selected in this district are the *pakari* (*ficus rumphii*), and the poma (*cedrela toona*). As far as is known the quality of the product is not affected by the tree on which the insect has been fed. The method of propagation is as follows. Pieces of stick lac containing living insects are placed in baskets and tied on to the twigs of the tree on which the next crop is to be grown. After a few days the insects crawl on to the young branches and begin to feed and secrete the resin. They are left undisturbed for about six months and the twigs encrusted with the secretion are then picked off. A good sized tree yields from 30 seers to two maunds of stick lac, the best results being obtained from trees of moderate growth, which do not contain too rich a supply of sap. Two crops are generally obtained in the year, the first being collected in May and June, the second in October and November. The first crop is largely used for seed, and it is the second which supplies the bulk of the exported lac. Ants and the caterpillars of a small moth sometimes do much damage to the insect, and a heavy storm at the time when they are spreading over the tree will destroy them

altogether. All the lac produced is exported in the crude form of stick lac. The industry is not confined to any particular caste or tribe. The principal centres are Parbatia village in the Mahabhairab mauza, Bihuguri and Barjargao in mauza Haleswar, and Chapai in Barchola mauza, all of which are in the Tezpur subdivision. The bulk of the lac in Mangaldai comes from Nahara in Orang mauza, Orang, Odalguri, Kalaigaon, Paneri, Sipajhar and Barpathar. The total output of the district is said to be about 4,000 maunds per annum, and the price obtained by the villagers to range from Rs. 25 to Rs. 30 per maund.

**Mats and
baskets.**

Mats and baskets are also made, but more for home use than for sale. Mats are generally made of split bamboo and are used for sleeping and sitting. The better kinds are known as *chok dhari*, while *noga dhari* are used by servants and low caste people. A better quality of mat is made by the Patias from *patidoi* (*clinogyne dichotoma*), and from the outer sheath of a plant called *tonga*. Of baskets there are numerous varieties. The basket usually suspended to the end of the bamboo *bhar* is known as *tola*. A finer variety of *tola* is known as the *dabeli bhar*, and is used at weddings and on other ceremonial occasions. The *dul* is a large bin in which grain is stored, the *jhopa* is a species of trunk made of split bamboo, and the *petera* is a similar article made of cane.

Fishing.

The fishing industry of Darrang is not of very great importance. The Doms or Nadiyals are the professional fishing caste. In 1901, there were over 9,000 of

these persons censused outside the tea gardens,* but many of them live to a great extent by agriculture, and look upon their net as a subsidiary means of livelihood. Strangely enough, even the highest castes may fish, and the element of degradation merely attaches to the selling of the catch. The right to fish in the larger rivers and *bils* is put up to auction every year, and fetches about Rs. 10,000. The purchasers of these mahals then levy a tax, generally of Rs. 6 per annum, on every person fishing in their water. The fisheries which fetch the largest sums at auction are the Brahmaputra and the Kharai *bil*. The revenue obtained from fisheries since 1900 will be found in Table XIV.

The fish are never salted, and very seldom dried, and are simply sold day by day to the people living in the neighbourhood. There is, however, a considerable export of fish from the Brahmaputra, which is carried by train on Sundays from Tezpur to the large markets near the tea gardens at Bindukuri, Barjuli, and Balipara. The best eating fish are roe (*labeo rohita*), chital (*notopterus chitala*), hilsa (*clupea ilisha*) and pithia.

The following are the nets most commonly in use. **Nets.** The *ghakata* is a net in the shape of a shovel which is pushed through the water and is generally used to catch *butchua* fish. The *pahjal* and *duitoma* are varieties of this net which have a larger mesh than the ordinary *ghakata*, and the net used to catch hilsa is of very much the same shape. The *kheuali* is a piece of net-

* This distinction is drawn as the Dom of the tea garden is generally a member of the degraded Bengal Dom caste, and is quite distinct from the Nadiyal of Assam.

ting weighted round the edge, and with a rope attached to the centre. The net is thrown flat on to the surface of the water, when the weights sink and drag the sides together, and any fish that it may have covered are entangled in the pockets round the edge. It is then drawn by the rope to a boat or bank. A small meshed *khewali* is called *angatha*, while those with larger meshes are known as *afalia* or *rekh*. The *uthar* is a *khewali* which is too large to be thrown by hand and is spread on the water by two men from a boat. The *langi* is a large net which is stretched right across a river, the bottom being weighted and the top buoyed. The fish are then driven towards the net and become entangled in its meshes. The *ohal jal* is a net of much the same kind, it is stretched across the river and allowed to drift down stream and the fish are caught by being entangled in its meshes. The *tala* or *tanajal* is another variety of the *langi*, one end of which is held by a man on the bank. The rest of the net is taken on the water in a boat and is gradually paid out in a semi-circle whose chord is the bank of the *hil* or river. The *parangi* is a square net the opposite corners of which are fastened to flexible bamboos. The net thus hangs like a sack from a stout pole to which the bamboos are attached, and is lowered into the water and raised at intervals. A large *parangi*, too heavy to be raised by hand, in which the pole to which the net is affixed is fastened to two stout posts, and thus works as a lever, is called *j'ntial* or *ghatjal*.

Traps.

Traps made of wicker work are also frequently employed to catch the smaller kinds of fish. The women of

the village are often to be seen walking through the shallow pools and streams during the rains, and continually dabbing down a *polo* on the mud. This *polo* resembles a huge inverted wine glass made of wicker work, with a short stem, through which any fish that may be caught are lifted out and placed in a large necked wicker work bottle tied round the fisher's waist. A smaller form of *polo* is called *juluki*. The *jakai* resembles a small bag of split bamboo, and is generally used by women. They place the mouth of the bag on the ground before them and trample up the mud and so frighten the fish into it. The *chepa* and *dingara* are traps of wicker work, the former oval, the latter shaped like a box. The fish enter through a trap door which they can push open from outside but cannot pull open from within. The *hukuma* is a hollow cone made of split bamboo, which is filled with brushwood and placed at the bottom of the river. The fish take shelter in the brushwood and are lifted out with the trap.

CHAPTER VI.

ECONOMIC CONDITION OF THE PEOPLE, COMMUNICATIONS, TRADE, TOWNS AND LOCAL BOARDS.

Rents—Wages—Prices—Food and dress—Dwellings—Economic condition of the people—Conventional restrictions—Communications—Development of steam navigation—Railway—Roads—Navigable rivers—Post and telegraph—Commerce and trade—Markets—Transfrontier trade—Fairs—Towns—Local Boards.

Rent.

When land is sublet the rent is paid either in cash or in kind; the former system being known as *sukani* or *khandua*, the latter as *adhi*. Under the *chukti* or *guti adhi* system the tenant contracts to deliver a fixed quantity of grain irrespective of the character of the harvest, but the more usual procedure is for the tenant and the landlord to divide the crop. The following description of the different forms of *adhi* tenure is taken from a note by Mr. Basu, Assistant to the Director of Land Records and Agriculture.

“*Adhi* proper, in which the crop is divided equally between landlord and the tenant. The produce may be divided either before reaping (*guch-adhi*), in which case the standing crop is divided in the field, each party reaping his own share; or after the tenant has cut the crop (*dal-adhi*) when the bundles (*danguris*) are equally divided; or after the tenant has cut and threshed the crop (*guri-adhi*, called also *guti-adhi* in Lower Assam) when the grain is divided. All work prior to the act of division and expenses incidental thereto are borne by the tenant. The seed grain alone is, as a rule, found by both parties in equal shares, and if one party has advanced it in the beginning, one bundle (*danguri*) of paddy per *bigha* is deducted from the whole

in payment of the advance, and the remainder is then divided equally between the landlord and the tenant. There is still another kind of division in which the tenant undertakes to cultivate the land up to the stage of the puddle (*boka-adhi*), when the land is divided in equal parts, each party transplanting his share with his own seedlings and at his own cost.

"In every form of *adhi* the Government dues are paid by the landlord. As a rule, it is only good productive lands which can be let on *adhi* tenure, particularly on the *chukti* and *guri* forms of the tenure. In *adhi* tenure, no extra payments are called for. Cash paying tenants, however, are often called upon to pay various perquisites which go to swell the nominal rent dues. The most common is gratuitous labour for a certain number of days in the year. This is ordinarily the case with all tenants holding temple lands. Not unfrequently the rent is partly, and, in some cases, wholly remitted in consideration of labour to hereditary tenants who are descendants of former *paiks* attached to the temple."

Statistics of subtenancy were compiled in 1899-1900 and are summarized in the following abstract :—

Name of Subdivision.			Total settled area for which returns compiled.	Total area sublet.	Area pay- ing pro- duce rents.	Area pay- ing cash rent.
			Acres.	Acres.	Acres.	Acres.
Tezpur	...	...	78,806	2,471	90	2,381
Mangaldai	...	...	180,580	19,839	2,073	17,766
Total ...			259,386	22,310	2,163	20,147

It will be seen that only 3 per cent of the settled area in Tezpur for which statistics were compiled, and 11 per cent of the corresponding area in Mangaldai were occupied by tenants. The existence of a considerable number of tenants in the latter subdivision is due to the fact that the estates of the Darrang Raja's family are situated in this locality. In Tezpur tenants are often

garden coolies who rent land from the Assamese in the neighbourhood of the plantations. Only one-eleventh of the total area sublet was held on *adhi* terms. The cash rents charged do not, as a rule, exceed the Government revenue demand. According to the census the number of cultivating tenants, both workers and dependants, in Darrang was 8,314 in 1891 and 16,468 in 1901.

Wages.

There is really no such thing as a landless labouring class in Darrang, and in 1891 only 1,124 persons were returned as supported by general labour.* Kacharis will, however, work on tea gardens for five or six months at a time, and ex-garden coolies, who have settled in the villages, will occasionally work on the plantations. Since 1897 labourers have come in greater numbers from Kamrup, but, in spite of this, nearly all the revenue officers complain of the difficulty of obtaining labour. The normal daily wage is 4 or 5 annas in Mangaldai, and 6 annas in Tezpur. Servants are generally fed, and receive 5 or 6 rupees per mensem as wages. In Mangaldai it is the practice to give a servant an advance, which is gradually worked off.

Artisans' wages.

Carpenters and masons are said to get from twelve annas to one rupee and blacksmiths one rupee to one rupee eight annas a day. The number of these artisans is, however, quite insignificant, and in quoting a rate of wages for the district it must always be borne in mind

* The figures for 1891 are given, as in that year all persons who combined general labour with agriculture were shown under the former head. In 1901, persons whose principal occupation was agriculture were shown as cultivators. Had the 1891 system been in force, the number of general labourers would only have been about 300 more than at the previous census.

that labourers cannot as a rule be obtained at all except through the intervention of some individual possessed of local influence.

The prices of rice, matikalai, and salt in February and August will be found in Table X. In 1835, Lieutenant Mathie reported that rice sold for 12 annas a maund, but since 1880 there does not seem to have been any very material rise of prices. They vary very largely in accordance with the character of the harvest, and rice is naturally much dearer in August than it is in February. Prices, too, are much lower in Mangaldai, where there is a comparatively small garden population, than they are in the markets near Tezpur. Salt is considerably cheaper since the reduction of the duty in 1904. **Prices.**

The staple food of the people is boiled rice eaten with pulse, spices, and fish or vegetable curry. Amongst the well-to-do, pigeon or duck occasionally take the place of fish, but fish is a very common article of diet, and is said to be a substitute for *ghi*, which is not very largely used. Goat's flesh is eaten by Muhammadans and members of the Saktist sect, and venison is always acceptable, and is frequently procurable, especially in times of flood, when the deer are driven into islets of higher land and are ruthlessly slaughtered from boats. Tea drinking is very common, especially in the early morning. Sweetmeats usually consist of powdered grain mixed with milk, sugar, and *ghi*. The ordinary form of dress for a villager is a cotton *dhoti* or waistcloth, with a big shawl or wrapper, and sometimes a cotton coat or waistcoat. Women wear a petticoat, a scarf tied round the bust, **Food and dress.**

and a shawl. Amongst the Assamese these cloths are generally home made, and in the case of the women, and of the large wraps used in the cold weather by men, are not unfrequently of silk. Foreign men generally wear coats and *dhotis* of Manchester cotton, and the women cheap but gaudy *saris* of the same material. Men and women alike generally go bareheaded, but the former sometimes twist a handkerchief round their heads, and on sunny or rainy days both sexes have recourse to the broad brimmed *jhapi*. The *jhapi* serves as a protection against the sun and rain, and is made of leaves and split bamboo, and decorated with coloured cloth. These hats are circular in shape, and range from two to four feet in diameter, but those of the larger size are more often carried than worn. Boots and shoes are the exception, and in their own homes even well-to-do people wear wooden clogs. Wooden sandals are also used by villagers when travelling or working in jungle ground, where there are tufts of sharp pointed grass.

Dwellings.

The homestead of the ordinary peasant is generally separated from the village path by a ditch or bank, on which there is often a fence of split bamboo. Inside there is a patch of beaten earth which is always kept well swept and clean. Round this tiny courtyard stand two or three small houses, almost huts, and in a corner there are generally two open sheds, one of which contains a loom while the other serves the purpose of a cow-house. The whole premises are surrounded by a dense grove of bamboos, plantains, and areca-nut trees, and there are often numerous specimens of the arum

family covering the ground. The general effect is extremely picturesque, but the presence of all these plants and trees makes the homestead very damp and excludes all sun and air. At the back there is generally a garden in which vegetables, tobacco, and other plants are grown. The houses are small, dark, and ill-ventilated and must be very hot in summer. They are built on low mud plinths, and are thus extremely damp. The walls are made of reeds plastered over with mud, or of split bamboo, the roof of thatch, the rafters and posts of bamboo. All of these materials can, as a rule, be obtained free of charge, and a house costs the owner nothing but the trouble of erecting it, but in spite of this they are small and badly built. The houses of the middle class are built on practically the same plan, but they are larger, and wooden posts and beams are often used in place of bamboo. The furniture of the cultivating classes is very simple, and consists of a few boxes, wickerwork stools and baskets, brass and bell-metal utensils, and bottles and earthen pots and pans. His bedding is a quilt made out of old cloths, and he either sleeps on a mat on the damp floor or on a small bamboo *machan* or platform. The well-to-do have beds, tables, and chairs in their houses, but these articles of luxury are seldom found outside the town.

There are no rich men amongst the Assamese in Darang, and very few who are even moderately well-to-do, but the explanation of this fact is not far to seek. The Assamese is a cultivator and nothing more, and with wholesale trade, crafts, and industries, he has little or

**Economic
condition of
the people.**

no concern. There are few capitalists who have the means to enable them to farm upon a large scale, and even were the money forthcoming, it would be very difficult to obtain the necessary labour. Outside the tea gardens the immense mass of the people are small peasant proprietors, who drive the plough themselves, and carry home the rice that has been cut by their wives and daughters. Such a community can never become rich, but it is well removed above the line of poverty, and it is seldom that any villager in Darrang goes hungry to his bed.

Most of the revenue officers consulted are of opinion that a considerable proportion of the villagers are in debt, but it is difficult to believe that indebtedness can have assumed serious proportions, though a certain amount of petty borrowing no doubt goes on. The rates of interest charged vary from two pice to one anna in the rupee per mensem for small loans for short periods, but loans for larger sums can be obtained at lower rates. The tea industry puts an immense amount of money into circulation, and no less than Rs. 26,44,000 were paid away in wages in 1903-04. Much of this finds its way no doubt into the pockets of the *kaiya*, but, even assuming that each adult cooly only spends Rs. 2 per mensem on rice, poultry, and vegetables purchased from the villagers, this would amount to over Rs. 11,50,000 in the year,* or more than the total revenue raised in the district from land revenue, cesses, and all heads of excise. The *raiya*t are said to obtain the cash required to pay their revenue

* There were 48,487 adult coolies in Darrang on June 30th, 1903.

and buy their little luxuries, by the sale of rice, vegetables, and poultry, for which they have a market at their very doors.

The mustard crop which is generally grown for sale is usually worth nearly three lakhs of rupees to the raiyats.* The Kacharis seldom grow much rice for sale, as they consume enormous quantities in beer, and many of them earn the cash they need by the sale of *eri* cloths, or by hollowing out canoes, or by working on the tea gardens. Tea garden work, though well paid, is irksome, and, as it entails an absence from home for several months, is not very generally resorted to.† In 1901, little more than one-tenth of the Kacharis of Darrang were censused on the plantations, and only a few hundreds had gone to districts further up the valley.

The people of Darrang do not seem to be hampered by many conventional restrictions. All castes, except the Brahman, rear the *eri* silk worm, but the cultivation of *pat* is restricted to the Katanis. All castes again catch fish, but only the Nadiyals, Kacharis, Rabhas, and Muhammadans will sell it. Very few people plough on the *ekudasi* (eleventh day of the waxing or waning moon), *purnima* (the full moon), *amabasya* (new moon), and the *sankranti* (last day of the month). The Assamese abstain from work during the *bihus*, and on the occasion of the *sradh* ceremonies of Sankar Deb and Madhab Deb. Pulse (*mah*) is not sown on days beginning with an m, or mustard (*shoriya*) on days beginning with an sh. The

* Assuming that they get Rs. 3-4 per maund.

† Kacharis will not generally take service on tea gardens unless they are given the opportunity of earning "doubles."

following quaint prejudices against certain days, reported from the Kalaigaon tahsil, are found to a greater or less degree in most parts of the district Monday—loans not given, *sali* dhan not sold; Tuesday—*ahu* and *sali* dhan not sold, shaving, and cutting of bamboos prohibited; Thursday—loans not given, shaving prohibited; Saturday—*ahu* dhan not sold, shaving, and cutting of bamboos prohibited. In some parts of the district certain days are considered particularly inauspicious for the payment of the land revenue. In Chutia, for instance, the raiyats avoid Mondays, Wednesdays, and Fridays; in Barchola, Mondays, Tuesdays, and Saturdays; and in Behali, Mondays and Saturdays.

Communi-
cations.
Early dif-
culties.

At the time when the British came into possession of Assam, the difficulty of communications proved a most serious obstacle to the development of the Province. The Brahmaputra was the great highway which connected this portion of the Company's dominions with Bengal, but the journey up the river for any boat of ordinary size was a very lengthy business.

McCosh, writing in 1837, stated that a large boat took from six to seven weeks to come from Calcutta to Gauhati, though the post which was conveyed in small canoes rowed by two men, who were relieved every fifteen or twenty miles, reached Gauhati in ten days and Bishnath in three days more.*

Few people presumably had sufficient time or patience to undertake the voyage at that season of the

* McCosh's Topography of Assam, p. 82. Butler, in his Sketch of Assam, puts the journey from Calcutta to Saikhoa in a badgerow *via* Dacca at over nine weeks even in the cold weather.

year. Week after week the weary traveller must have pursued his tedious way, his view bounded as a rule by high banks of treacherous sand, which then as now were continually being undermined by the current and falling with a crash into the water. It was only occasionally that he could relieve the monotony of the voyage by a stroll on shore, as through the greater part of its course down the valley the banks of the river are covered with high reeds and grass, which are quite impenetrable to a man on foot, and the tedium of this dreary voyage must have been immense. Canoes, of course, could travel faster against the current, but a canoe is not a vessel in which the ordinary man can journey for many days in comfort.

This was the state of things for twenty-two years after our annexation of the valley, but in 1848 the Government steamers were deputed to ply between Calcutta and Gauhati. Three years later, the Commissioner, Major Jenkins, made the not unreasonable proposal that three or four times a year they should be allowed to proceed right up the valley to Dibrugarh. His suggestions were negatived by the Marine Department on the ground that the voyages would be financially a failure, but his views were strongly urged on Government by Mr. Mills when he visited the Province in 1853. The proposal met with the approval of the Lieutenant-Governor, instructions were issued for the despatch of a steamer in that year, and several voyages were made with results that were not unsatisfactory even from the financial point of view. The journey from Gauhati to

Beginning
of steam
navigation.

Dibrugarh and back occupied no more than fifteen days, an extraordinary contrast to the interminable delay of the same voyage in a country boat. The cargo tendered soon exceeded the carrying capacity of the steamers, and in 1855 Lieutenant-Colonel Jenkins complained that the vessels reached Gauhati fully laden with goods shipped in Upper Assam, so that Gauhati and the ports below derived practically no advantage from the downward service of the steamers.

As was only to be expected the rates at first charged were fairly high, and a ticket from Calcutta to Gauhati cost no less than Rs. 150. On the other hand the accommodation was designed on an extremely liberal scale. The regulations issued in 1851 expressly authorized passengers to carry pianos in their cabins free of freight, provided that they were required for use during the voyage and were not in packing cases, a proviso which suggests a very deliberate voyage as compared with the speedier travelling of the twentieth century. Freight on ordinary stores seems to have been charged at the rate of one rupee per cubic foot between Calcutta and Gauhati, but for some time longer a great part of the trade of the Province continued to go by country boat. The planters could never count on being able to despatch their tea by steamer, and were thus compelled to keep up an establishment of country boats, and having got the boats to use them, and the same objection held good in the case of native merchants.* The cost of working the line was heavy, but in

* Memorandum by the Director of Public Instruction, Bengal, dated the 7th February 1857.

spite of this it showed a fair profit, and it was evident that there would be a great development of the traffic if only facilities were provided for it.

In 1860, the India General Steam Navigation Company entered into a contract to run a pair of vessels every six weeks provided that the Government boats were taken from the line, and, since that date, the steam navigation of the Assam Valley has been in the hands of this Company, and the River Steam Navigation Company with whom they are associated. But, in spite of the existence of a regular service, and the quickening effects of private enterprise, travelling still continued to be very slow. The steamers did not profess to run to scheduled time, the delay at the larger ports for the loading and unloading of cargo was considerable, and the passenger no doubt often required his piano to beguile the tedium of the way. In 1861, the Commissioner, Colonel Hopkinson, was disposed to take a gloomy view of the condition of affairs, and in a letter to Government openly gave expression to the opinion that it would be better to compensate the planters for any loss they might sustain, and abandon the Province, unless Government were prepared to enter upon a course of vigorous material improvement. In the same letter he drew the following dreary picture of the isolation of Assam :—

“With the furious current of the Brahmaputra, still unconquered by steam, opposing a barrier to all access from without, and not a single road fit for a wheeled carriage, or even passable at all for a great portion of the year, there is such an absence of the full tide of life running through Assam, such a want of intercourse between man and man, as does and must result in apathy, stagnation, and torpidity and a terrible sense of isolation,

Private
steamers put
on the river.

by which enterprise is chilled and capital and adventurers scared away. The profits of tea cultivation should attract hundreds where tens now come, but the capitalist is not always to be found who will venture his money in a country to which access is so difficult as it is to Assam, through which his correspondence travels at the rate of a mile and a half an hour, and in which it may take a month to accomplish a journey of two or three hundred miles ; nor, on the other hand, is it every spirit, however bold, that cares to encounter so dreary a banishment, and to be so entirely cut off from his fellows in a place from which exit is only possible at rare intervals, and must be so literally a prison or tomb to him."

Matters, however, gradually improved, and in 1884 a daily service of mail steamers was started between Dibrugarh and Dhubri, connecting with a steamer which plied between the latter place and Jatrapur. Here the traveller who was pressed for time could take the train to Calcutta, though the line was not of the most comfortable, as more than one river had to be crossed in boats before the capital of Bengal was reached.

The introduction of a daily steamer service represented an enormous advance in the facilities for communication between Assam and the outer world. The large steamers were not uncomfortable, but progress was slow, and not only the hour but the date on which they left any given port was far from certain. The would-be traveller could not choose his own time for starting on his journey, but had to select a date on which a steamer was expected at the nearest ghat, and even then he not unfrequently had to endure a weary period of waiting by the river bank. The daily service changed all that, and combined the advantages of regularity with a speed, which, in comparison with that attained by the large cargo boats, was most

commendable. During the rains Dibrugarh was reached on the fifth day after leaving Dhubri, while the downward journey was performed in three days. The navigation of the river is not entirely free from difficulty, the companies were not incited to further efforts by competition, and some years elapsed before any attempt was made to reduce the duration of the voyage. On the completion of the Assam-Bengal Railway the companies realized that it was necessary to accelerate their timing if they were to retain their traffic, and steamers now reach Dibrugarh on the fourth day from Dhubri, while the voyage from Dibrugarh to Goalundo only occupies three days.

The ports at which the steamers call in Darrang are Rangamati for Mangaldai, Singri, Tezpur, Bishnath, Behalimukh and Gamirighat.

The only railway, in the district is a small line on the **Railway.** 2' 6" inch gauge which was constructed in 1896 by a private company. It runs from Tezpur, past Dekargaon, Bindukuri, Sessa, Thakurbari and Rangapara to Bali-para, 20 miles away. From Rangapara there is a branch line to Barjuli. It was primarily constructed to afford an outlet to the tea manufactured on the prosperous estates through which it passes, and cost altogether Rs. 4,87,000. It is a well-managed little line, and in 1903 paid a dividend of 5 per cent.

The north trunk road enters the district at the point **Roads,** where it crosses the Barnadi, and runs right through it, a distance of 151 miles. The following is the list of marching stages; the figure in brackets shows the dis-

tance which each stage is from the next stage to the west : Mangaldai (16 miles), Dalgaon (14 miles), Orang ($14\frac{1}{2}$ miles), Dekhiajuli ($8\frac{3}{4}$ miles), Gabharu (10 miles), Dipota ($6\frac{1}{2}$ miles), Tezpur ($6\frac{1}{4}$ miles), Jamaguri (12 miles), Chutia ($7\frac{1}{2}$ miles), Burigaon ($9\frac{1}{4}$ miles), Behali ($10\frac{1}{2}$ miles), Helem ($9\frac{1}{2}$ miles), Gohpur ($9\frac{1}{4}$ miles), Kalabari ($7\frac{1}{2}$ miles). At each of these stages there is an inspection bungalow furnished with chairs, tables, and bedsteads. Bed clothes and mattresses, kitchen utensils and crockery must be provided by the traveller.

There are altogether 420 miles of road kept up by the Local Boards of the district. These roads are shown on the map appended to this volume, but the system is too complicated to admit of its being properly described in detail. The most important roads are the road that runs due north from Tezpur to Balipara, the road east of the Bhareli that runs parallel to but north of the trunk road as far as Behali, and the roads that run from the Brahmaputra to the north of Mangaldai. In Tezpur there are inspection bungalows at Goroimari and Balipara, on the 5th and 14th mile of the Tezpur-Balipara road. In Mangaldai there are bungalows at Kalaigaon, Nalbari, Odalguri, Bengbari, Shekhar, Silaikuchi, Patharughat, and Chinakona. Most of the minor streams are spanned by timber bridges, but the traveller in Darrang is still often delayed by ferries. Even on the trunk road the following rivers are unbridged: the Barnadi, the Dhansiri, the Rowta, the Pachnai, the Gabharu, the Bhareli, the Bargang, and the Burai. In the dry weather the only rivers which are not fordable are the Barnadi, the Dhan-

siri, and the Bhareli, but in the rains all of them have to be crossed on ferry mars. These mars are formed by fastening two canoes, or two iron cylinders together, and building a timber platform on the top. These floating platforms are very steady and any animal, short of an elephant, can be crossed on them. Generally speaking, the district is well supplied with the means of communication. The Brahmaputra is the great highway of commerce, and all that is required is a sufficient number of branch roads to connect it with the interior. East of Tezpur the trunk road, running as it does parallel to the river, carries little traffic. None of the roads are metalled, and they are, in consequence, much cut up if largely used for carting in the rains. In proportion to its population there is no district in the Province where carts are as numerous as in Darrang. In 1899, there were 3,500 of them, or four times the number found in the neighbouring district of Kamrup. Buffaloes are largely used as draught animals, especially in Mangaldai.

Apart from the Brahmaputra, the rivers of the district are not much used for purposes of commerce. In the cold weather there is often little water in the channel; in the rains the current is generally too swift. They have, moreover, an uncomfortable way of changing their courses and overflowing their banks, a habit which tends to prevent the growth of villages in the immediate neighbourhood. In the rains a certain amount of traffic goes up the Dipota to Bindukuri, and up the Ghiladari and Marnai; in the cold weather these rivers are not navigable for boats of four tons burthen. A vessel of that size can proceed up

**Navigable
rivers.**

the Bhareli as far as Balipara in the cold weather, and up to Namiri in the rains, but, as this river flows most of its course through jungle, it carries little traffic. The Nanai and the Barnadi in Mangaldai are used to some extent as trade routes, and in the rains a large boat can proceed up the latter river, as far as Malmuraghat, though in the cold weather it cannot generally get above Sonarikhat.

**Post and
Telegraph.**

The following statement shows what an enormous development there has been of postal business in Darang since 1876 :—

Number of post offices in		Number of letters and post-cards omitting thousands delivered in			Number of Savings Bank account in		Balance at the credit of the depositors	
1875-76.	1903-04.	*1861-62.	1870-71.	190-304.	1871-72.	1903-04.	1871-72.	1903-04
2	22	1	33	428	29	1,345	Rs. 2,900	Rs. 2,81,323

There were 22 post offices in 1904 against 2 in 1876, while the number of letters and postcards delivered in the former year is thirteen times the number handled in 1871. The savings bank has also made most satisfactory progress, and considering the low rate of interest given, and the scarcity of capital in the district, the volume of deposits is considerable. The figures for 1872 were returned after the bank had only been open for a few months, but even then, on general grounds, the local officers were inclined to think that the experiment would prove a failure.

* According to the statistical account of Assam, Vol. I, p. 159, only 1,386 letters etc., were received, and 1,034 despatched from the district in 1861-62.

The mail is carried to Darrang by steamer, and is distributed by runners throughout the district, except in the case of post offices along the Tezpur-Balipara Railway, which are served by rail. Statement B in the Appendix shows the places at which post and telegraph offices are situated.

The trade of Darrang is not of very much importance. **Commerce and Trade.** External trade is carried on almost entirely with Calcutta, and most of it enters and leaves the district by steamers. The principal exports are tea, mustard seed, rubber, hides, and canes, while the articles received in exchange are rice, gram, and other grains, kerosine and other oils, piece goods, machinery, hardware, and salt. Apart from tea nearly all the export and import trade is in the hands of the Marwari merchants, locally known as *kaiyas*, who are the great shopkeepers and money-lenders of the Assam Valley. They purchase their surplus products from the raiyats, and supply them in return with cloth, thread, salt, oil, and, very often, opium. Tezpur is the principal trading centre of the district, and after Tezpur, but *longo intervallo*, comes Mangaldai. In these two places there are a certain number of Muhammadan shopkeepers from Eastern Bengal, who deal in general haberdashery and oilman's stores. A list of the villages in which there are three or more permanent shops will be found in the Appendix. Each tea garden is also a small centre of trade, and on every estate there are one or two *kaiyas* shops.

Retail business is to a great extent transacted at weekly **Markets.** markets, which are generally held in the vicinity of the

larger tea gardens. The articles offered for sale include rice and other grain, fruit and country vegetables, poultry, earthenware and metal vessels, oil, molasses, tobacco, and cotton cloth. Two of the largest markets are those at Amaribari and Bindukuri, which, like most of these bazars, are held upon a Sunday. On the previous day lines of carts are to be seen coming in from the direction of Orang, laden with poultry, rice, and other rural produce. Special trains are run from Tezpur to serve these *hats*, and are crowded with shopkeepers and their wares. Other considerable markets are those at Barjuli, at Paneri and Kalaigaon in Mangaldai, and at Chutia east of the Bhareli. A list of the places where markets are held will be found in the Appendix (Statement D).

Transfrontier Trade. Transfrontier trade is carried on at the fairs held at Odalguri, and Ghagrapara; and starting from these centres the Bhutias spread over the country. The principal imports are blankets, cattle, sheep, small shaggy ponies, wax, and musk; the chief exports are cotton twist and piece goods, rice, and silk cloth.

The Bhutias at one time did a considerable trade in salt at Odalguri, as they bartered it for rice with the villagers, at rates which were very favourable to themselves. The improvement in communications, and the opening of large and flourishing plantations near Tezpur, produced a marked change in the relative value of these two commodities. Liverpool salt became more accessible in the Kachari mauzas, and traders from Tezpur who came with their carts to make purchases at Odalguri and Orang sent up the price of rice. At one time the

Kacharis willingly gave 15 seers of rice for one of salt, but, as the price of rice began to rise, the villagers complained of the exactions of the Bhutias, and at the durbar of 1886 the rate of exchange was fixed at 8 to 1. This rate was certainly high, but it was not high enough for the Bhutias, and in the winter of 1888-89 they created some annoyance by leaving salt at the houses of the people, when the men were at work in the fields, and then demanding 12 or 15 times its weight in rice. The matter was promptly settled by the Deputy Commissioner, who refused to pay the *posa* to the Gelengs, until they had signed an agreement, in which it was provided that the rate of exchange should be 4 to 1. At this rate the export of salt is not very remunerative to the Bhutias, and there has in consequence been some falling off in trade at the Odalguri fair. Rubber is also imported from the Dafia and Aka Hills, but is generally taken direct to the kaiyas' shops.

In the Mangaldai subdivision fairs are held on the occasion of the Baisakh Bihu, which are attended by considerable numbers of villagers. A list of the places where the principal fairs are held will be found in Statement E. in the Appendix. Fairs.

Tezpur is the only place in the district which has the smallest title to the name of town. It has already been suggested (page 22) that it is probably identical with Durjaya, the capital of the Pala kings, and, if this assumption is correct, it must once have been a place of very considerable importance. The existence of the magnificent temple ruins on the Bamuni hills, and the Tezpur town.

massive pieces of carved stone which are found lying about the station, clearly show that it was once the seat of a civilized and powerful prince. But it was never the capital either of the Koch or Ahom kings, and at the time when we came into possession of the district it was nothing more than a small, unhealthy village. Even in 1872, it only had a population of 1,877 persons. Since that date it has grown with some rapidity, and the figures for the three last enumerations were—1881, 2,910 ; 1891, 4,011 ; and 1901, 5,047.

Tezpur is situated on the right bank of the Brahmaputra in $26^{\circ}37'$ N. and $92^{\circ}47'$ E. The north trunk road passes through the town, it is a port of call for river steamers, and a railway connects it with the country to the north. The houses of the European residents are built on low hills along the river bank, from which a magnificent view is to be obtained on a clear day of the Himalayan snows. Behind these hills there is a green maidan, dotted over with magnificent umbrageous trees and tastefully laid out with plants and flowering shrubs. The native and business quarter is situated at the back.

The town was constituted a municipality under Act V (B. C.) of 1876 in 1893. The municipal committee is composed of ten members, eight of whom are nominated by the Chief Commissioner, while the Deputy Commissioner, who acts as chairman, and the Civil Surgeon, are *ex-officio* members of the board. A tax is levied at the rate of 5 per cent on the annual value of holdings, which had an incidence of 6 annas 4 pie per head of population in 1903-04. From Table XVIII it will be seen that the

proportion of revenue raised by direct taxation is very small. Drinking water is obtained either from the Brahmaputra or from four excellent masonry wells. Nine miles of metalled and six miles of unmetalled road are maintained by the municipality.

Mangaldai is a village, which in 1901 had only 711 ^{Mangaldai.} inhabitants, but it is the headquarters of the subdivision, and contains the residence of the Subdivisional Officer. The public buildings include the magistrate's court, a small jail, a police station, and a dispensary. There is a small bazar, but the trade is not of much importance. The village is situated on the left bank of the Mangaldai river and immediately to the south there is a large *chapori*, or wide stretch of marshy country, reaching to the Brahmaputra.

In the early days of British administration there ^{Local} was little money available for public works of any kind, ^{Boards.} and what there was was generally expended under the control of the Public Works Department or the District Magistrate.

In 1872, the management of the district roads was entrusted to a committee presided over by the Deputy Commissioner. The funds at their disposal were partly obtained from tolls and ferries on local roads and other miscellaneous sources, but principally from grants made by the Bengal Government from the amalgamated district road fund. In 1874, when Assam was erected into a separate Administration, the Government of India assigned one-seventeenth of the net land revenue for local purposes. The district improvement fund was then

started, and the administration of its resources was as before entrusted to the Deputy Commissioner assisted by a committee. The actual amount placed at their disposal was not large, and in 1875-76 the total income of the district funds of the province was only Rs. 1,85,000, which was a small sum in comparison with the twelve and a half lakhs of rupees received by the Local Boards in 1903-04. In 1879, a Regulation was passed, providing for the levy of a local rate, and the appointment of a committee in each district to control the expenditure on roads, primary education, and the district post. Three years later the district committees were abolished by executive order, and their place was taken by boards established in each subdivision, which are the local authorities in existence at the present day. The Deputy Commissioner is chairman of the board of the headquarters subdivision, but the Mangaldai board is presided over by the Subdivisional Officer. The Local Boards are entrusted with the maintenance of all roads within their jurisdiction, except a few main lines of communication, the provision and maintenance of local staging bungalows and dispensaries, and the supervision of village sanitation, vaccination, and the district post. They are also in charge of primary education, subject to the general control of the Education Department, and are empowered to make grants-in-aid to schools of higher grade, subject to certain rules. For these purposes, they have placed at their disposal the rate which is levied under the Assam Local Rates Regulation of 1879 at the rate of one anna per rupee on

the annual value of lands, as well as the surplus income of pounds and ferries, and some minor receipts. This income is supplemented by an annual grant from Provincial Funds. The principal heads of income and expenditure are shown in Table XVII. The annual budgets of the boards are submitted to the Commissioner for sanction. The estimates for all works costing Rs. 500 or over must be submitted to the Public Works Department for approval, and important works, requiring much professional skill, are made over for execution to that department. Less important works are entrusted to the board overseers.

CHAPTER VII.

GENERAL ADMINISTRATION.

Land revenue—Native system—Early settlements—The settlement of 1893—The growth of land revenue—Town lands—Established and fluctuating cultivation—Annual and periodic leases—Settlement staff—Land tenures—Collection of land revenue—Tahsildari and mauzadari system—Area of unsettled waste—System of excise—Opium—Country spirit—Laopani—Ganja—Income tax—Stamps—Public Works—Government—Administration of justice—Registration—Volunteering—Police—Jails—Education—Medical aspects—Lunatic asylum—Surveys.

**Land
revenue:
Native
system.**

The revenue system in force under the Ahom kings was one of personal service. The whole of the adult male population was divided into bodies of three men called *gots*, each individual being styled a *paik*. One *paik* out of the three was always engaged on labour for the state, and while so employed was supported by the remaining members of his *got*. In return for his labour each *paik* was allowed 8 *bighas** of *rupit* land, and the land, occupied by his house and garden, which is now called *basti*, free of revenue. Any land taken up in excess of this amount was assessed at Re.0-4-0 a *bigha*. In addition to this the villagers paid a hearth tax of one rupee for each party cooking separately.

Buchanan Hamilton, writing in 1809, states that each pargana was let for a term of years to a Chaudri, who

* One acre=3·025 bighas.

made what profit he could out of land held in excess of the *paiks*' free grants. The Chaudris are said to have retained for their own use three-fifths of the gross collections, and to have treated the raiyats in a very oppressive manner. The nominal rent per plough of land in Kamrup was Rs. 2, but the exactions of the Chaudri raised it to Rs. 5 or Rs. 7. The yield of a plough was said to be 79 maunds of "rough rice" and 16 maunds of mustard seed, and as estimates of yield prior to the era of crop experiments were generally too high, the area of a plough was probably between four and five acres, and the rates exacted by the Chaudri must at that time have seemed oppressive. These remarks have been quoted as in all probability the system prevailing in Darrang was not dissimilar from that existing in Kamrup.

North of the Brahmaputra, the whole of the profits of agriculture were, according to the same authority, absorbed by the Government or the hill tribes, each power sending a force, which took as much as possible from the cultivators. On the occupation of the country by the British, the system of compulsory labour was abolished and the *paik* land was assessed to revenue. The rates varied slightly from time to time, but prior to 1865 did not exceed 6 annas per *bigha* for *rupit* and 4 annas 6 pie for other kinds of land. In that year the Commissioner, Lieutenant-Colonel Hopkinson, proposed to discriminate between *basti* or garden and other land and to raise the *bigha* rates to Re. 1 for *basti*, 10 annas for *rupit*, and 8 annas for other land. No detailed enquiries were made, there was no attempt to estimate the comparative value of the

Early
settlements
and
settlement
of 1868-69.

three different classes of land, there was no discrimination between good and bad land in the same class or even between district and district. The revised rates were, however, so moderate that it was never seriously contended that they would have an oppressive incidence even on the worst land on which they were imposed. Colonel Hopkinson was of opinion that the existing assessment was ridiculously low, and in support of his opinion pointed out that in 1864-65 the receipts from opium were about 4 lakhs of rupees more than the total land revenue of his division, an excess which in those days represented a difference of about 40 per cent. The new assessment was successfully introduced in 1868-69, and in spite of the enormous enhancement the revenue was collected without difficulty.

**The
settlement
of 1893-94.**

The next settlement was made in 1893. The three-fold division of land was retained, but instead of imposing the same rate on all land of the same class throughout the district, the villages were divided into four grades and the rates assessed varied with the grade of the village.* The villages were provisionally graded by the Director of Land Records and Agriculture, the class in which each village was placed being determined

* The following were the rates assessed per *bigha* :—

Class.			Basti.	Rupit.	Faringati
			Rs. a.	Rs. a.	Rs. a.
1st	...	...	1 6	1 0	0 12 per <i>bigha</i> .
2nd	...	...	1 4	0 14	0 10 "
3rd	...	...	1 2	0 12	0 9 "
4th	..	...	1 0	0 10	0 8 "

by the demand for land, and not by any intrinsic considerations of the value of the produce, the fertility of the soil, or the profits of cultivation. The demand for land was estimated by ascertaining the density of the population, the proportion of settled to unsettled land, and the proportion of fluctuating cultivation. These lists were sent to local officers for examination, and were modified by them in view of the fertility of the soil, the facilities for bringing the produce to market, and the rents paid by subtenants where ascertainable. This enquiry was carried out by the ordinary district staff, within the space of a single cold weather, and the results obtained made no pretensions to scientific accuracy. Such accuracy was considered to be unnecessary, as it was not intended to impose anything like the maximum assessment on the land. The Government had no desire to assess up to its fair share of the value of the produce of the soil, and under these circumstances it was contended that it would be waste of time and money to have recourse to any minute and elaborate classification of the soils, to crop experiments on a large scale, or to a close examination of all the elements that affect the net profits of the cultivator. The theory on which the settlement was based was that the worst lands were capable of bearing the assessment imposed, and that Government alone was a loser by its inequalities.

The following statement shows the gradual expansion of the land revenue and the settled area since the

**Growth of
the land
revenue,**

district first came under our administration :—

A. D.	Rs.	Acres.
1834-35	1,07,392	107,788
1852-53	1,79,578	221,849
1865-66	1,94,846	193,465
1868-69	3,57,768	<i>not available.</i>
1892-93	4,96,692	370,933
1893-94	6,48,820	372,399
1902-03	7,23,876	426,827

The figures for years in which a new settlement was introduced are printed in italics.

**Town
lands.**

Tezpur town was resettled for thirty years with effect from April 1899. The highest rates assessed per acre of trade sites were Rs. 30 rising to Rs. 45 in the eleventh year; and for each acre of residential land Rs. 18 rising to Rs. 24. Under the rules now in force waste land taken up for the first time within town limits is to be settled ordinarily for a term of thirty years, at a fair rent not exceeding the annual letting value of the site. The lease of the land applied for may, if the Deputy Commissioner thinks fit, be put up to auction and knocked down to the highest bidder. Land in Mangaldai village is assessed at the rate of Rs. 2 per *bigha*.

**Established
and fluctu-
ating culti-
vation.**

The system of cultivation in the district falls into two main heads, established and fluctuating. In the established area the staple crop is *sali* or transplanted paddy, land is not readily resigned, and frequently possesses a considerable market value. In the fluctuating tracts the staple crops are mustard, pulse, and summer rice (*ahu*), and continual change is one of the essential elements of cultivation, the same field being seldom cropped for more than three years in succession. The fluctuating area is found near the Brahmaputra, and more especially at the western end of the district.

The bulk of the land on which the staple crops are grown is held direct from Government by the actual cultivators of the soil on annual or periodic leases. The periodic lease confers a right of re-settlement and a heritable and transferable title. Annual leases merely authorize the occupation of the land for a single year, though in practice the rights of transfer, inheritance, and re-settlement are recognized. The only drawback of the annual lease lies in the fact that if the land happens to be required by Government, it can be resumed without payment of compensation to the occupant. Land held under either form of lease or any individual field within the holding can be resigned, on formal notice of the fact being given to the Collector.

The basis of the land revenue system is the **mandal** ^{**Th. Mandal.**} the village accountant and surveyor, who draws a modest stipend ranging from Rs. 8 to Rs. 12 per mensem. In March, he proceeds to his circle, inspects the fields which have been formally resigned to see whether they have been actually relinquished, tests the boundaries of fields taken up in recent years to see whether they are in accordance with the map, and surveys land which has been broken up for what is called the regular settlement or for which a formal application has been filed. His two principal registers are the *dagchitha*, in which particulars are entered for each field within the village, and the *jamabandi* or rent roll, which classifies the fields by holdings and shows the area covered by each lease. During the hot weather he is occupied with the revision of his maps and registers, and the preparation of his leases.

When the winter comes, he again proceeds to the field, distributes the leases he has prepared, and surveys the land which has been broken up since his former tour, and which is included in what is known as the *dariabadi* or supplementary settlement. He is also required to prepare statistics of the area under different crops, he assists in the collection of the revenue, and is often ordered to report on local disputes connected with the land. In most Provinces in India a settlement is concluded for a term of years. During its currency no land which is held on lease can be resigned, and there is not as a rule any appreciable quantity of waste land to be taken up. The state of affairs in Darrang is very different. In 1902-03 the total settled area was 426,827 acres, the area excluded from settlement was 17,211 acres, and the area of land included 27,639 acres. It must not, however, be supposed that this kaleidoscopic shifting of the fields is taking place in every portion of the district, and that everywhere may be seen the spectacle of cultivated land becoming jungle and jungle land changing into fields of waving rice. In the established portion land is seldom given up, but in the fluctuating area, as has been already explained, it is less trouble to burn the jungle and break up new land every second or third year, than to clean the fields of the weeds which spring up after they have been two or three times cropped.

**Superior
settlement
staff.**

Above the mandal comes the supervisor kanungo, a peripatetic officer on pay ranging from Rs. 30 to Rs. 40 who checks his work both in the field and in the office. The superior revenue officers are called sub-deputy

collectors and draw salaries ranging from Rs.100 to Rs.200 per mensem. The appointments are usually made by selection from candidates, who must be of good physique and moral character, of respectable family, under 25 years of age, and must either have taken a university degree or have read up to that standard.

The total sanctioned staff for the Darrang district is two sub-deputy collectors, excluding those employed as tahsildars, eight supervisor kanungoes, and 146 mandals.

The different tenures in the district fall under two main classes (1) those under which land is held for the cultivation of ordinary crops, and (2) those under which grants have been made for the growth of tea or other crops, which are not included amongst the ordinary staples of the Province, and which require a considerable amount of capital for their production. The bulk of the land included in the first class is settled under the ordinary rules at full rates, but there are also considerable areas of revenue free (*lakhiraj*) land and land settled at half rates (*nisfi-khiraj*). In the time of the Ahom kings the whole of this land is said to have been held rent free, but in 1834 the Government of India ruled that "all rights to hold lands free of assessment founded on grants made by any former Government must be considered to have been cancelled by the British conquest. All claims therefore for restoration to such tenures can rest only on the indulgence of Government without any right." Mr. David Scott, the first British Commissioner of Assam,

**Land Ten-
ures.**

found that, even under the Ahom Rajas, these revenue free lands had been assessed at the rate of five annas a *pura*,* and he imposed this cess, which was subsequently raised to eight annas, upon them. The Government of India then directed that an enquiry should be instituted into these claims, and that all cases in which land was held on *bonâ fide* grants dating from before the time of the Burmese conquest, or on account of services which were still performed, should be reported to them for orders. These instructions were not fully observed by the Commissioner of that time, Captain (subsequently General) Jenkins. This officer, for reasons which have never been ascertained, drew a broad distinction between *debottar* or temple lands and *brahmottar* and *dharmottar* lands, *i. e.*, lands which were devoted to some religious purpose but were not actually the property of a temple. The former he released from all claims for revenue, on the latter he imposed the rate assessed by Mr. Scott, which happened to be half the full rates prevailing at the time. No report was submitted to the Government of India and no final orders were ever received from them, but the right of the former class of proprietors to hold free of revenue, and of the latter at half the usual rates, has been definitely recognised. Waste land included within the boundaries of *nisfi-khiraj* estates is at present assessed at 1 anna 3 pies per *bigha*, and as the proportion of uncultivated land in these estates is fairly high, this assessment adds considerably to the gross demand. The total area of *lakhiraj* land in the district in 1903-04 was 5,071

* A *pura* = 4 *bighas*, 3·025 *bighas*=1 acre.

acres and of *nisfi-khiraj* land 31,058 acres. The area settled year by year at full rates is shown in the appendix.

Two sets of rules were in force for the grant of land for tea prior to 1862. The underlying principle in each case was that the land should be held on long leases, at low but progressive rates of revenue, and that precautions should be taken against land speculation by the imposition of clearance conditions. Between 1862 and 1876, the fee simple tenure of waste land grants was put up to auction at an upset price of Rs.2-8-0 an acre, which in 1874 was raised to Rs. 8. The holders of grants under the earlier rules of 1838 and 1854 were allowed to purchase a fee simple tenure by payment of twenty times the revenue then due, provided that the clearance conditions had been carried out. Advantage was very generally taken of this concession, and there is no longer in the district any land held under the rules of 1838 and only 293 acres under the rules of 1854, while there are 52,197 acres held on fee simple tenure. The existing rules came into force in 1876. The land is sold at an upset price of Re. 1 per acre, for though it is nominally put up to auction there is no case on record in which more than one applicant appeared to bid. For two years the grant remains revenue free, and the rates gradually rise to 8 annas an acre in the eleventh, and one rupee in the twenty-first year. The lease runs for 30 years, and when it expires the land is liable to re-assessment. The total area settled under these rules will be found in Table XV in the appendix.

**Grant of
land for the
cultivation
of special
crops.**

**Collection
of land re-
venue.**

The collection of ordinary land revenue was first introduced in Darrang in 1833. The lands in each village were measured up by an amin, leases were issued to the raiyats, and an officer, called the *patghiri*, was made responsible for the collection of the revenue. In 1841-42, a new experiment was tried. Settlement was made with the *patghiri* for a term of years, and he was held responsible for any losses that might occur, but was allowed to absorb any profits that accrued from the extension of cultivation. This system proved, however, to be unsatisfactory, and was abandoned, and recourse was again had to the annual settlement, under which the fiscal officer was only responsible for the collection of the revenue. The experiment was also tried of farming out the *chapor*i mahals to the highest bidder, but it was found that the cultivators were oppressed, and their holdings were accordingly settled with them direct. The cost of collection was, however, heavy. The *patghiri* or fiscal officer, received as remuneration 10 per cent of the collections, and was assisted by a *kakati*, who received 5 per cent. To this must be added the cost of a considerable number of chaukidars, each of whom received 16 *bighas* of rent free land.*

**Larger
mauzas and
tahsils.**

In 1853, there were no less than 149 mauzas in Darrang, containing on an average 14 villages with a revenue of Rs. 1,215. The general tendency since that date has been to increase the size of the unit of collection. In 1867, the mauzadars, as the collecting officers

*See Report on the Province of Assam by A. J. Moffatt Mills. Darrang, para. 28, Calcutta, 1854.

were called, received 15 per cent of the revenue as commission, and were allowed half the revenue of land reclaimed during the currency of the settlement. Three years later their commission was reduced to 10 per cent, and in 1872 the further restriction was imposed that this 10 per cent could only be drawn on the first Rs.6,000 of revenue, 5 per cent being allowed on revenue in excess of that sum. In 1883, the idea gained ground that Government would do better by putting the mauzadar aside and employing salaried officials as a collecting agency. Mauzas were accordingly amalgamated and placed in charge of an official called a tahsildar, who was remunerated by a fixed salary, and was exempted from the responsibility imposed upon the mauzadar of paying in the revenue on the due dates, irrespective of the amounts actually collected by him. The first tahsil was opened at Tezpur in 1884. Then, in 1886, came Hindughopa, subsequently transferred to Patharughat; Kalaigaon in 1888; and Mangaldai in 1892. These three tahsils are all situated in the southern and central part of the Mangaldai subdivision. The last tahsil to be opened was the one at Chutia, east of the Bhareli, in 1893. This arrangement left about 30 per cent of the land revenue demand to be collected by mauzadars.

The tahsildari system is cheaper than that of collection through mauzadars, the cost in one case being about 5 per cent, in the other 7 per cent of the gross amount realized. Serious difficulties are, however, experienced in dealing direct with such a large body of raiyats, and there is no doubt that the tahsil system

Comparative advantages of tahsildars and mauzadars.

is not as popular with the people as the one which it replaced. A mauzadar of experience knows whether delay in payment is due to shortness of funds or to recalcitrancy; he knows the time which is most convenient for payment in individual cases, and as he is not bound by the *kist* dates his collection admits of an elasticity which no Government rules can establish. It has the further advantage of providing a body of representative men, who, while regarded by the people as their leaders, are bound to the Government by the facts of their position. It has accordingly been decided to try the experiment of gradually breaking up the tahsils and substituting in their place mauzadars, who will be entrusted with the duty of collecting from Rs. 20,000 to Rs. 30,000 of revenue.

Compulsory realization of revenue.

The revenue demand on account of the regular settlement is due in two instalments, three-fifths on January 15th, and two-fifths on the 15th February, except in those villages which meet the Government demand from the sale of mustard and pulse, when it is due in one instalment on March 15th. The demand on account of the supplementary settlement is also due in one instalment on that date. In 1903-04, notice of demand* was issued on account of 10 per cent of the total land revenue demand, but it was only necessary to attach property on account of 2 per cent of the demand. The number of cases in which it was necessary to have recourse to sale was very small, and the revenue on

* The Deputy Commissioner has since been authorized to dispense with the notice of demand in those cases in which he considers it advisable to do so and to proceed at once to the attachment of the property of the defaulter.

account of which property was sold only represented 0·1 per cent of the total demand.

The figures in the margin show the total area of the district as reported by the Assistant Surveyor-General, Calcutta, the settled area and the area of reserved forests in 1902-03, and the area of waste land at the disposal of Government in that year. No less than 71 per cent of the total area of the district falls in the latter category, but it must not be supposed that the whole of this area is fit for cultivation or human habitation. The figures include the area of roads, and of tracts that are permanently under water, which in Darrang with its networks of rivers draining into the mighty Brahmaputra amounts to a very considerable total. It also includes the area of marshes which are submerged during the rainy season, and are hardly fit for permanent habitation, and of land which is too high or barren to be fit for the growth of food crops. It is useless to attempt to form any estimate of the proportion of the unsettled area in which cultivation could be carried on with profit, and it is hardly necessary to do so, as it is obvious that the district could support a very much larger population than it now possesses.

The unsettled area in each tahsil and mauza is still enormous. Details will be found in Table XV A

More than three-fourths of the excise revenue of Darrang is usually obtained from opium. Prior to 1860, no restriction was placed upon the cultivation of the

	Square miles.

System of
excise ;
Opium.

poppy. The evil effects of unrestrained indulgence in opium were undeniable, and in that year poppy cultivation was prohibited; and the drug was issued from the treasury, the price charged being Rs. 14 a seer. This was raised to Rs. 20 in 1862, Rs. 22 in 1863, Rs. 23 in 1873, Rs. 24 in 1875, Rs. 26 in 1879, Rs. 32 in 1883, and Rs. 37 in 1890, the price at which it now stands. While Assam was under the Bengal Government licenses for the retail vend of opium were issued free of charge. In 1874, a fee of Rs. 12 per annum was levied on each shop, and in the following year it was raised to Rs. 18. Between 1877 and 1883, the right to sell opium in a particular *mahal* was put up to auction, but this system was found to be unsatisfactory, and in the latter year the individual shops were sold, as is done at the present day. The general result of the Government policy has been to enormously reduce the facilities for obtaining the drug. In 1873-74, there were in the district 856 shops for the retail vend of opium; thirty years later there were only 100.

**Consump-
tion.**

The following figures for consumption show the extent to which the use of opium has been affected by the raising of the duty: 1873-74, 237 maunds; 1879-80, 275 maunds; 1889-90, 207 maunds; 1899-1900, 179 maunds. 1879-80 shows a large increase over the figures of 1873-74, but some exceptional cause was apparently in operation in the latter year as the average annual consumption between 1875 and 1880 was only 248 maunds.

The quantity of opium issued in 1899-1900 was 28 per cent less than this average of 20 years before. This decrease is probably due to a reduction in the number of shops, to an increase in the rate of duty by 13 rupees a seer, and to the fact that the price of opium is now so high that non-consumers have a very distinct inducement to abstain from taking to such an expensive habit.

In 1835, the retail price of opium was reported by the Collector, Mr. Mathie, to be Rs. 5 per seer. Since 1890, it has ranged from Rs. 40 to Rs. 50 a seer, and it is obvious that such an enormous increase in the price must have a very perceptible effect upon consumption.

About three-fifths of the total quantity of opium taken by the district is consumed in Mangaldai, where the drug is much in favour amongst the Kachari population.

Opium is generally swallowed in the form of pills or mixed with water and drunk. Madak is made by mixing boiled opium with pieces of dried pan leaf, and stirring it over the fire. The compound is then rolled up into pills and smoked. Chandu is made out of opium boiled with water till the water has all evaporated, and is smoked like madak in the form of pills. Opium is not generally smoked in Assam, and this form of taking the drug is usually supposed to be more injurious than when it is simply swallowed.

The outstill system is still in force in the district, that is to say, the right to manufacture and sell spirit at

Way in
which
opium is
taken.

Country
spirit.

a particular locality is put up to auction, and no attempt is made to levy duty on the actual quantity of spirit distilled. The abstract in the margin shows that during the last twenty years of the century there was a considerable increase in the revenue derived from country spirits.

Year.	Number of shops.	Revenue. Rs.
1873-74	11	1,457
1879-80	18	6,887
1889-90	21	19,094
1899-1900	15	48,327

Between 1881 and 1901, the foreign population of the district, and it is the foreigners who consume the bulk of the country spirit sold, increased four and a half fold. In spite of this, the facilities for obtaining liquor were very considerably reduced. The revenue realized depends upon the amount of competition when the shops are put up to auction. In a sparsely populated district like Darrang there were few representatives of the liquor trading classes, and the vendors were thus enabled to absorb an unduly large proportion of the profits. Towards the end of the century efforts were made to ensure that the liquor vendors should pay a substantial sum for their licenses, though the number of shops was reduced by 29 per cent.

The attention of the administration has been more than once directed to the discovery of the most effective means of discouraging a taste for drinking, but one of the most serious obstacles to improvement lies in the fact that if the supply of licensed liquor is cut off, rice beer and spirit can be readily manufactured by the people. Complaints have been received of excessive drunkenness on tea gardens, which were situated far

beyond the reach of any licensed liquor shop. The outstill system is not theoretically the most desirable, but owing to the difficulty of communications, and the facilities that exist for the manufacture of illicit liquor, it has not yet been found possible to introduce any more satisfactory method in its place. The following measures have recently been introduced with the object of reducing as far as possible the evils attendant on the liquor trade. A special excise establishment has been entertained, the vendor is required to arrange for an abundant supply of good drinking water near his shop, and his license can be withdrawn if he is twice convicted of allowing drunkenness and disorderly conduct near the still. The liquor shops which do the largest business are situated at Bindukuri, Balipara, Tezpur, Harka, and Sakomati.

Country spirit is manufactured by native methods, and generally in what is known as the open still. The apparatus employed consists of a large brass or copper retort, which is placed over the fire, to the top of which is fitted the still head, a compound vessel, part of which is made of earthen ware and part of brass. The wash is placed in the retort, and as it boils rises in the form of vapour into the still head, over the outer surface of which a stream of cold water is continually kept flowing. As the vapour cools it is precipitated in the form of liquid, and is carried off by a bamboo tube into a vessel placed at the side. The mouth of this tube is open, and the spirit trickles from it into the vessel beneath, so that the outer air has access by this channel into the still head and

**Country
spirit. The
still.**

retort in which the process of distillation is going on. In the closed still the vapour passes down two tubes into two receivers, where it is cooled and condenses into liquid. These tubes are so fixed to the receivers that the air cannot have access to the spirit, and though distillation does not proceed so rapidly, the liquor produced is stronger than that obtained from the open still.

**Material
employed.**

The material employed is generally the flower of the mohwa tree (*bassia latifolia*) which contains a very large proportion of sugar, but its place is sometimes taken by molasses and rice. The following are the proportions in which these ingredients are generally mixed : mohwa 30 seers and water 60 seers ; or mohwa 25 seers, molasses 5 seers, and water 60 seers ; or boiled rice 20 seers, molasses 10 seers, and water 80 seers. *Bakhar*, a substance composed of leaves, roots, and spices, whose actual ingredients are not divulged by the villagers who manufacture it, is frequently added to the wash, which is put to ferment in barrels. Fermentation takes three or four days in summer and a week in the cold weather, and the wash is then considered to be ready for the still. The process of distillation takes about three hours. A retort of 40 gallons yields two gallons of spirit in an hour and three-quarters, three gallons in two hours and a quarter, and four gallons in three hours. The best and strongest spirit comes off first, and in the case of a brew of 30 seers of mohwa, the first $3\frac{1}{2}$ gallons will be classed as *phul* if they are at once drawn off from the receiver. If they are allowed to remain while two more gallons are distilled, the whole $5\frac{1}{2}$ gallons will be classed as *bangla*. The exact

proportions vary, however, at the different shops, some distillers taking $4\frac{1}{4}$ gallons of *phu* or $5\frac{1}{4}$ gallons of *bangla* from 30 seers of mohwa. Occasionally only two gallons of spirit are distilled from 30 seers of mohwa, and the liquor is then called *thul*, is very strong, and is sold for one or two rupees a quart. *Thul* is also sometimes made by redistilling *bangla*. Only one kind of liquor is generally taken from each distillation as if the *thul* or *phu* were removed, the spirit subsequently distilled would be not only weak but impure. Strong liquor watered to reduce it to a lower strength is not considered palatable, and it seems to be the usual practice to distil the liquor at the actual strength at which it will be sold. One disadvantage of the cheaper kind of liquor is that it will not keep, and in four or five weeks it is said to lose all its spirituous qualities.

Laopani or rice beer is the national drink of the uncon- **Laopani.** verted tribes, and a special name, *mo-lahi*, is applied to those who have to some extent attorned to Hinduism but have not yet abandoned their ancestral liquor. It is also taken by some of the humble Hindu castes, and is largely used by garden coolies if facilities are not afforded to them for obtaining country spirit. The following is the usual system of manufacture followed: The rice is boiled and spread on a mat, and *bakhar* is powdered and sprinkled over it. After about twelve hours it is transferred to an earthen jar, the mouth of which is closed, and left to ferment for three or four days. Water is then added and allowed to stand for a few hours, and the beer is at last considered to be ready. The usual proportions are

5 seers of rice and 3 chattaks of *bakhar* to some 8 or 10 quarts of water, and the liquor produced is said to be much stronger than most European beers. Liquor is often illicitly distilled from *laopani* or boiled rice, by a simple method. An earthen pot with a hole in the bottom is placed on the top of the vessel containing the *laopani* or rice, and the whole is set on the fire. The mouth of the upper pot is closed by a cone-shaped vessel filled with cold water, and a saucer is placed at the bottom of the pot over the hole. The vapour rises into the upper of the two jars, condenses against the cold cone, with which the mouth is closed, and falls in the form of spirit on to the saucer beneath. Care must of course be taken to see that the various cracks are closed against the passage of the spirituous vapour, but this can easily be done with strips of cloth.

Ganja.

Ganja is usually mixed with water, kneaded till it becomes soft, cut into small strips, and smoked. Wild ganja grows very freely in Assam, but it is doubtful whether it is much used except as a medicine for cattle. It does not produce such strong effects as the ganja of Rajshahi, but the leaves are sometimes dried and mixed with milk, water, and sugar to form a beverage. Ganja is not much used except by foreigners, and from Table XVI it will be seen that the revenue raised from this drug is comparatively small, and that most of it is obtained from the *sadr* subdivision. It is imported from Rajshahi in bond by a wholesale dealer who pays a duty of Rs. 11 per seer when issuing it for sale to the retail vendors. The right

of retail sale is put up to auction.

The total receipts under the head of income tax in **Income Tax.** 1903-04 amounted to Rs. 15,654, two-thirds of which were derived from the salaries of garden managers and their staff. The receipts under the head of other sources of income amounted to Rs. 2,112 paid by 74 persons. About three-fourths of this was paid by 60 dealers in piece goods, the head under which the general merchant who sells grain, oil, salt and other miscellaneous articles is classified. Some of the largest firms of Kaiyas are, however, assessed in Calcutta on the profits that they make in Darrang. The only other assesseees under this part were five pleaders, five mauzadars, three graziers and a liquor seller. The assessment lists are annually revised by the tahsildars and mauzadars, and notices issued on those concerned to show cause if they desire to do so. Darrang is a progressive district, and the receipts under this head of revenue steadily increased from Rs. 12,300 in 1888 to Rs. 21,300 in 1900. The marked decrease which occurred in 1904 was chiefly due to the fact that the minimum taxable income was raised from Rs. 500 to Rs. 1,000 per annum by Act XI of 1903.

The receipts under the head of judicial and non-**Stamps.** judicial stamps are considerably lower than those obtained from any other district in the plains except Nowgong. In 1903-04, they only amounted to Rs. 25,577 under the former head, as compared with Rs. 17,568 in Nowgong, the lowest district in the plains, and Rs. 4,04,169 in

Sylhet. The corresponding figures for non-judicial stamps were Rs. 6,396, Rs. 3,923, and Rs. 1,51,623 respectively.

**Public
Works.**

Public works are in charge of an Executive or Assistant Engineer, who acts as Engineer of the Nowgong district and is usually assisted by two upper and four lower subordinates.

The Public Works Department are entrusted with the construction and maintenance of all the large public buildings. The most important are the jail, the public offices, schools, and post and telegraph offices at district and subdivisional headquarters, circuit houses, dāk bungalows, and inspection bungalows on provincial roads. Inspection bungalows on other roads are maintained by the Local Boards. The provincial roads, which are directly under the department, are a section of the north trunk road, 151 miles in length, from Dumnichaki to Howhajan and the road from Mangaldai to the steamer ghat.

It has already been explained that Local Board works that require professional skill or engineering knowledge are usually made over to the Executive Engineer for execution. The principal difficulties with which the department has to contend are the absence of an artizan class, and the scarcity and dearness of unskilled labour. It is to these two causes that the heavy cost of public works in Darrang is largely due.

Government.

For general administrative purposes the district is divided into two subdivisions. Tezpur is under the

immediate charge of the Deputy Commissioner, and Mangaldai is entrusted to an Assistant Magistrate, who is almost invariably a European.

The Deputy Commissioner is allowed one subordinate magistrate and a sub-deputy collector as his assistants, and a second magistrate and a sub-deputy collector are usually posted at Mangaldai.

Appeals lie to the Deputy Commissioner from the orders passed by magistrates of the second or third class, and from the orders of first class magistrates to the Judge of the Assam Valley. Appeals from the Judge lie to the High Court of Judicature at Fort William in Bengal. In 1902, there were six stipendiary and two honorary magistrates in the district, and the former decided 943 and the latter 101 original criminal cases. In the course of these proceedings 2,847 witnesses were examined. Altogether there were 1,159 cases under the Indian Penal Code returned as true, the immense majority of which were either offences against property or against the human body. The people are as whole law-abiding and there is not much serious crime in Darrang, and most of these offences were either petty assaults or thefts of small sums.

The civil work in Darrang is lighter than in any other district in the plains and the Deputy Commissioner acts as sub-judge, while one of the assistant magistrates in each subdivision discharges the functions of a munsif. In 1902, the sub-judge heard three original cases and seven appeals, while 1,098 original suits were disposed of by

the munsifs. Almost all of these cases were simple money suits and more than three-fourths of them were disposed of without contest. Further details with regard to criminal and civil business will be found in Table XI.

Registration.

The Deputy Commissioner is also the Registrar of the district and one of the assistant magistrates act as sub-registrar in each subdivision. The number of documents registered is, however, very small, and in 1903 only amounted to 377; a fact which shows in a very striking manner, how extremely simple is the economic organisation of Darrang.

Volunteering.

A corps of mounted infantry was first enrolled in Darrang in 1887, with a strength of 70 members. Four years later the volunteers in the four upper districts of the valley were formed into one corps known as the Assam Valley Mounted Rifles, and in 1896 the Mounted Rifles were converted into Light Horse. The strength of the corps in 1903 was 312, 72 of whom were residing in Darrang.

Police.

The Civil Police are in charge of a District or Assistant Superintendent of Police. The sanctioned strength consists of 2 inspectors, 16 sub-inspectors, and 221 constables. One hundred and two smooth bore Martinis are allotted to Darrang, and a reserve of men is kept up at the district and subdivisional headquarters who are armed with these weapons and are employed on guard and escort duty. Up-countrymen, Nepalese, and members of the aboriginal tribes are usually deputed to this work, though attempts are made to put all the constables through an annual

course of musketry. The district is fairly free from serious crime and rural police are not employed, such assistance as is necessary being given by the village elders or *gao-bura*. In addition to their regular duties in connection with the prevention and detection of crime, the police are required to check the returns of vital statistics, manage pounds, enquire into cases in which death has not been due to natural causes, to furnish guards and escorts, and to serve all processes in warrant cases. Table XX in the appendix shows the places at which there are investigating centres and the strength of officers and men maintained at each.

A detachment, consisting of a native officer and 33 **Military Police.** non-commissioned officers and men of the Lakhimpur military police battalion, is stationed at Tezpur throughout the year. For six months in the cold weather detachments, consisting of two non-commissioned officers and twelve men, are posted at Daimara and Ghagrapara in the north of Mangaldai, while from January to March the fort at Odalguri, near the gorge through which the Dhansiri leaves the hills, is occupied by 45 non-commissioned officers and men under a native officer. This post was formerly held by a detachment from the regiment in Shillong, but the health of the sepoys was injuriously affected, and in 1902 it was decided that the work should be made over to the military police. The men of the battalion are armed with Martini Henry Rifles mark IV, kukris, and bayonets.

There is a jail at Tezpur with accommodation for 226 **Jails.** convicts. The prisoners generally enjoy fairly good

health, and in the twenty years ending with 1900 there were only three in which the number of deaths exceeded 10 and the death rate 70 per mille.* Convicts sentenced to hard labour are usually employed on oil pressing, bamboo and cane work, carpentry, weaving, brick making, and gardening. The jail premises cover an area of nearly two acres. Most of the wards have three walls of brick and the fourth of whole bamboos : the roof is generally of thatch. At Mangaldai there is a small jail with accommodation for 26 convicts. The prisoners are generally employed on gardening or oil pressing and are not detained in this jail for more than three months, convicts with a longer term being sent to Tezpur.

Education.

During the first half of the nineteenth century the condition of education in Bengal was bad enough, but in Assam it was even worse. In 1835, the District Magistrate of Darrang reported that there were only three small public schools in the district and a few private schools, and described the state of education as "deplorable.†" In 1847-48, there were 8 primary schools in the district. The next few years witnessed very little progress, as on the occasion of Mr. Mill's visit in 1853 there were only 9 schools of all grades. 1874-75 is the first year for which complete statistics are available, and the following abstract shows the progress of education since that year. Figures for years subsequent to 1900-01 will be found in the Appendix.

* Death rate per mille, 1893, 119; 1894, 88; 1895, 75.

† File No. 298, Bengal, 1836, page 33.

1900-01	5	599	149	4,095	4,694	72	17.62	0.43

The schools of the district are divided into five distinct grades, high, middle English, middle vernacular, upper primary, and lower primary. High schools are those institutions which are recognised by the Calcutta University as capable of affording suitable preparation for the Entrance Examination. The boys are taught from their earliest stage of their education up to the Entrance course as prescribed by the University of Calcutta, but many leave school without completing the course. Till recently English was taught in all the classes. The boys in the lowest class no longer learn that language, but the standard of instruction is higher than that prevailing in lower secondary (middle) schools. English is the medium of instruction in the first four classes of high schools; in the lower classes and in other schools the vernacular is employed. The course of instruction at middle English and middle vernacular schools is the same, with the exception that English is taught in the former and not in the latter. The following are the subjects taught in the middle vernacular course : (1) Assamese, comprising literature, grammar

Secondary
education.

and composition, (2) history of India, (3) geography, (4) arithmetic, (5) elements of Euclid (Book I), mensuration of plane surfaces and surveying, (6) simple lessons on botany and agriculture. There are high schools at Tezpur and Mangaldai, and middle schools at Tezpur, Chutia, and Sipajhar.

Primary education is again divided into upper and lower, but the proportion of boys in upper primary schools is less than three per cent of the total number, and this class of school, like the middle vernacular, is slowly dying out. The course of study in lower primary schools includes reading, writing, dictation, simple arithmetic, and the geography of Assam. In upper primary schools the course is somewhat more advanced, and includes part of the first book of Euclid, mensuration, and a little history. The standard of instruction given still leaves much to be desired, but efforts have been recently made to improve it, by raising the rates of pay given to the masters. Fixed pay is now awarded at average rates of Rs.8 per mensem for certificated and Rs.5 per mensem for uncertificated teachers, supplemented by capitation grants at rates ranging from 3 annas to 6 annas for pupils in the three highest classes. The inspecting staff consists of two Deputy Inspectors of Schools.

**Medical.
The Civil
Surgeon.**

The district is in the medical charge of the Civil Surgeon who is stationed at Tezpur. It contains ten dispensaries and the supervision of the work done at these institutions is one of the most important duties of the Civil Surgeon. He also acts as Superintendent of the Jail and of the

Lunatic Asylum, controls and inspects the vaccination department, and is required to visit and report on all tea gardens on which the death rate for the previous year has exceeded 7 per cent.

It has already been suggested in the chapter on population that there may be something in the climate, the sub-soil level of the water, or some other factor which for the present remains obscure, which is prejudicial to life and health, but there can be no doubt that the conditions under which the people pass their days are not conducive to a long mean duration of life. Their houses are small, dark, and ill-ventilated, and the rooms in summer must be exceedingly close and oppressive. They are built upon low mud plinths, and are in consequence extremely damp, and the inmates instead of sleeping on beds or bamboo platforms, which would cost them nothing to provide, often pass the night on a mat on the cold floor. Their attire, which is suitable enough for the warm weather, offers but a poor resistance to the cold and fogs of winter, and many lives are annually lost from diseases induced by chills, which might have been avoided by the purchase of a cheap woollen jersey. The houses are buried in groves of fruit trees and bamboos, which afford indeed a pleasant shade, but act as an effective barrier to the circulation of the air, and increase the humidity of the already over-humid atmosphere. Sanitary arrangements there are none, the rubbish is swept up into a corner and allowed to rot with masses of decaying vegetation, and the complete absence of latrines renders the neighbourhood of the village a most unsavoury place. The

**Unsanitary
character
of villages.**

water-supply is generally bad, and is drawn either from shallow holes, from rivers, or from tanks in which the villagers wash their clothes and persons. All of these are undoubtedly factors which contribute to produce a high mortality, and nearly every one of them could be eliminated.

Vital statistics.

Vital statistics are reported by the *gaobura* or village headmen, to the mandal of the circle ; this report being in theory submitted every second week. In practice they were received at much longer intervals as the *gaobura* was an unpaid servant of Government and not very amenable to discipline. It has recently been decided to allot to each *gaobura* 2½ acres of land revenue free, and it will now be possible to enforce a stricter adherence to the rules. Between 1891 and 1901, the mean recorded birth rate was 26 per mille, and the death rate 38 per mille, but neither of these rates can be accepted as correct. The statistics of age recorded at the census are, however, so unreliable, and the disturbing effect of immigrants is so great, that it is not possible to fix a normal birth and death rate for the district.

Causes of mortality.

Fever and bowel complaints are the forms which death most often takes in Darrang, at any rate according to the official returns. These returns are, however, so inaccurate and so little reliance can be placed on the diagnosis of the reporting agency, that the figures hardly repay examination. Most fatal illnesses

	Cholera death rate per mille.

1901	... 16.9

are accompanied by a rise in temperature, and the villagers are in consequence very prone to ascribe every death to fever. Epidemics of cholera from time to time produce a high mortality, for though it is apparently endemic in the district, it occasionally breaks out with quite exceptional violence. The abstract in the margin shows the recorded death rate from this cause in the years when cholera was most prevalent, and for the purposes of comparison the death rate in England from all causes in 1901 is added. In 1878, the recorded death rate from this disease alone exceeded the total death rate of England in 1901. Small-pox also appears from time to time in a virulent form. The highest death rate recorded from this cause in recent years was 3 per mille in 1899. The people do not seem to fully appreciate the advantages conferred by vaccination, and during the five years ending with 1902-03, only 33 per mille were on the average annually protected which was 11 per mille less than the average for the Province as a whole. Dysentery and diarrhoea are common, and so are worms and various forms of skin disease. Goitre is common in villages situated on the banks of rivers, near the point at which they issue from the hills; elephantiasis is rare. Venereal disease is common amongst the immigrant population, but not amongst the Assamese.

The most deadly lethal agent in the district has, however, been the mysterious form of fever known as *kala-azar*. The following account of this disease is extracted from the Report on the Census of Assam in 1901.

“ When first referred to in the Sanitary Reports of the province, it is described as an intense form of malarial poisoning, which was popularly supposed to be contagious. The Civil Surgeon of Goalpara, however, rejected the theory of contagion, and in 1884 expressed the opinion that *kala-azar* was simply a local name for malarial fever and its consequences. In 1889-90 a specialist (Surgeon-Captain Giles) was appointed to investigate both *kala-azar* and the so-called *beri-beri* of coolies, and he rapidly came to the conclusion that *kala-azar* and *beri-beri* were merely different names for *anchylostomiasis*, and that the mortality was due to the ravages of the *dochmius duodenalis*, a worm which lives in the small intestine. This theory corresponded with the observed facts to the extent that it admitted, what at that stage of the enquiry could hardly be denied, that *kala-azar* was communicable, the uncleanly habits of the natives of the province affording every facility for the transfer of the ova of the parasite from the sick to the healthy ; but the support which was given to Dr. Giles' views by local medical opinion was withdrawn when Major Dobson proved by a series of experiments that *anchylostoma* were present in varying numbers in no less than 620 out of 797 healthy persons examined by him. In 1896, Captain Rogers was placed on special duty to make further investigations, and, in addition to demonstrating various differences of a more or less technical character in the symptomatology of the two diseases, he pointed out that, whereas *kala-azar* was extremely inimical to life, the number of cases of *anchylostomiasis* that terminated fatally was by no means large. The conclusion to which this specialist came, after a very careful enquiry, was that the original view was correct, and that *kala-azar* was nothing but a very intense form of malarial fever, which could be communicated from the sick to the healthy, an opinion which was to a great extent endorsed by the profession in Assam, successive Principal Medical Officers declaring that whatever *kala-azar* was, it had been abundantly proved that it was not *anchylostomiasis*. The suggestion that malaria could be communicated did not, however, commend itself to the entire medical world, and was criticised with some severity, Dr. Giles writing as recently as 1898 — ‘ Dr. Rogers, like a medical Alexander, cuts his Gordian knot by announcing that Assamese malaria is infectious. In this he places himself at variance with not only the scientific but the popular opinion of the entire world.’ A complete change in popular and scientific opinion was, however, brought about by the development of Manson's mosquito theory, and Major Ross, who visited Assam, in the course of his enquiry

into the manner in which infection by malaria takes place, confirmed Rogers' conclusions, and in 1899 placed on record his opinion that, as stated by Rogers, *kala-azar* was malarial fever. Externally the chief point of difference between *kala-azar* and ordinary malarial fever lies in the rapidity with which the former produces a condition of severe cachexia, and the ease with which it can be communicated from the sick to the healthy."

Recent investigations have, however, thrown some doubt on the malarial theory. Certain parasites called Leishman Donovan bodies have been discovered in the spleens of fever patients, and it is thought possible that they may be the causes of the complaint. The origin of the disease is obviously a matter which must always be open to doubt. Captain Rogers is of opinion that *kala-azar* was imported from Rangpur, where malarial fever was extraordinarily virulent in the early seventies, but this is still a matter of conjecture. As to its effects there can unhappily be no question.

The disease appears to have entered the Mangaldai

	Percentage Popula- tion 1891. variation between 1891 and 1901.	subdivision in 1890 and was especially virulent in the Patharughat, Mangal- dai, and Kalaigaon tahsils and in the Ambagaon and Harisinga mauzas near the

Bhutan Hills. The statement in the margin shows the percentage of decrease in population that occurred in these areas between 1891 and 1901.

It has also appeared near Tezpur and Bishnath, but has not as yet produced a very high mortality in this portion of the district, though it is still fairly common in many places in Darrang.

**Increase in
facilities for
obtaining
medical aid.**

	Dispensaries	Patients treated.	Though there can be little doubt that many lives are annually lost which could be saved by proper treatment, it is satisfactory to know that of recent years there has been a great increase in the facilities for obtaining medical aid, and the extent to which the people avail themselves of the advantages now offered to them. From the statement in the margin it appears that for every patient treated in 1881 there were 15 in 1901, while the number of operations performed rose from 176 to 487. The principal dispensaries are those situated at Tezpur, Mangaldai, and Sipajhar which had in 1903 a daily average attendance ranging from 59 to 62. The diseases for which treatment is most commonly applied are malarial fevers, worms, cutaneous disorders, dysentery and diarrhoea, dyspepsia, and rheumatic affections.

1901	10	59,783	

The number of patients treated at each dispensary in 1900 and the succeeding years will be found in Table XXV.

There are very few professional midwives amongst the Assamese, and a woman in her confinement is generally attended by her relatives or friends. In difficult cases they can render little help, and recourse is had to Heaven for assistance. A goat or duck is sacrificed, and *mantras* are tied round the neck and arm of the woman or inscribed on a brass vessel which is placed where her eyes can fall upon it. In cases of false presentation attempts are made to drag the child out by anything that offers, and

the abdomen is kneaded in the hope that the foetus may be expelled. In the absence of medical aid, and this aid is seldom to be obtained, the mother in such cases generally dies. The confinement sometimes takes place in a small hut which has been specially constructed for the purpose and the patient's bed generally consists of an old mat laid on the floor. The unfortunate mother receives practically no assistance; if the labour is a natural one, all is well, but if complications arise, the case has usually a fatal termination. Many lives are also lost owing to a disregard of the rules of cleanliness which are of such paramount importance in these cases.

There is a lunatic asylum at Tezpur to which insane persons are sent from the Assam Valley and the Hill districts. The population in 1903 was 155, and the average cost of maintaining each of the inmates was Rs. 55. The grounds are tastefully laid out, and those of the patients who are not suffering from insanity in an acute and dangerous form are employed in the garden attached to the asylum and encouraged to do light work of other kinds. Lunatic
Asylum.

A professional revenue survey of the district was made at the time when Assam was still a division of Bengal and the maps were published in 1877. They are on the scale of one mile to the inch, and show the sites of villages and the physical features of the district. A smaller map on the scale of four miles to the inch was published in 1882 and was brought up to date in 1901. Survey.

An area of 857 square miles which included the more densely populated portions of the district was cadastrally surveyed in the seasons of 1886-87 and 1891-92. The maps are on the scale of 16 inches to the mile, and in addition to topographical features show the boundaries of each field. Certain areas which were omitted by the professional party were subsequently surveyed by local agency, on the basis of a theodolite traverse, and the results obtained have been utilized in the revision of the one inch maps.*

* The area so surveyed up to 30th September 1900 was 130 square miles.

PREFACE.

The Gazetteer of Nowgong lacks what is generally associated with works of this nature, *i.e.*, a directory. There is, however, only one town in the district, and that town has been described at length. The great bulk of the population live on tea gardens or in villages, which do not lend themselves to a detailed description, and a directory of these villages would be entirely out of place. Lists of all the tea gardens and of all villages that are centres of trade have, however, been appended to the volume, and reference has been made in the text to all villages which are noted for any special industry. It is hardly necessary to add that whenever the Province is referred to, it is to the old Province of Assam as constituted in 1904 that reference is made. My acknowledgments are due to the Deputy Commissioner, Major Halliday, for his kindness in examining the work in proof.

SHILLONG :
September, 1905. }

B. C. ALLEN.

CHAPTER III.	
The People.	
Area and density—Towns and villages—Variation in popula- tion—Immigration—Sex and marriage—Infirmities— Language—Caste and tribes—Religions—Occupations— Marriage customs—Amusements and festivals—The Bihus—Gosains— <i>Sattras</i> —Temples. ...	62-105
CHAPTER IV.	
Agriculture and Forests.	
Crops grown—Rice—Mustard—Pulses—Fibres—Storage and threshing of grain—Agricultural implements—Sugarcane— Preparation of molasses—Causes affecting productiveness	

of land—Garden crops—Yield and value of crops—	PAGE.
Floods—Irrigation and attempts to improve the system of	
cultivation—Live stock—Grazing grounds—Cattle	
disease—Commencement of tea industry—Labour force—	
Soil—Varieties of plant—System of cultivation—System of	
manufacture—Outturn and prices—Forests. ...	...106-140

CHAPTER V.

Industries.

Industries—Silk—Weaving—Pottery—Brass and bell-metal—	
Lac—Mat-making—Fishing. ...	...141-153

CHAPTER VI.

**Economic condition of the people,
Communications, Trade,
Town, and Local Board.**

Rent—Wages—Prices—Food and dress—Dwellings—Economic	
condition of people—Indebtedness—Sources from which	
villagers obtain cash—Social restrictions—Communica-	
tions—Development of steam navigation—Railway—	
Roads—Waterways—Post and telegraph—Commerce and	
trade—Municipality—Local Board. ...	...154-181

CHAPTER VII.

General Administration.

Land revenue—Native system—Early settlements—The settle-	
ment of 1893-94—Expansion of land revenue—Established	
and fluctuating cultivation—Annual and periodic leases—	
Land tenures—Collection of land revenue—Tahsildari and	
mauzadari system—Area of unsettled waste—Excise—	
Opium—Country-spirit— <i>Laopani</i> —Ganja—Income-tax—	
Stamps—Public Works—Government—Administration of	
justice—Registration—Volunteering—Police—Jails—Edu-	
cation—Medical aspects—Surveys. ...	...182-222

CHAPTER I.

PHYSICAL ASPECTS.

Area and boundaries—General appearance—Mountain system—River system—Marshes—Geology—Climate—Fauna.

The district of Nowgong is situated on the south bank of the Brahmaputra in the Assam Valley and derives its name from its principal town (Noa-gao the new village). It covers an area of 3,843 square miles, and lies between 25°36' and 26°42' N. and 91°57' and 93°45' E. On the north it is bounded by the Brahmaputra; on the east by Sibsagar; on the south by the Naga, North Cachar, and Jaintia Hills; and on the west by the Khasi and Jaintia Hills and Kamrup. Area and boundaries.

The greater part of the district is a level plain, intersected with numerous rivers and water courses, and dotted over with *bils* and marshes. In places this plain is fairly densely peopled, and the banks of the Kalang are lined with villages; but near the Brahmaputra the country is liable to inundation in the rainy season, and there are wide stretches of waste land covered with reeds and grass. On the north-east, the Mikir Hills impinge upon the plain, and a considerable tract of hilly country is included in the boundaries of the district. On the south-east, there is the broad but sparsely peopled valley of the Kapili, the valley of it's General appearance

tributary the Langpher which makes its way between the Mikir Hills and the hills of North Cachar, and the upper valley of the Dhansiri, which is bounded on either side by hills. On the west, the outlying spurs of the Khasi and Jaintia Hills project into the plain. Nowgong might thus be roughly described as a tract of level country bounded on the north by the Brahmaputra, and surrounded on the three remaining sides by hills.

Across the centre of this plain stretches a belt of cultivated land from Silghat on the north-east to Jagi in the south-west; but on either side of this belt cultivation falls off, and there are wide expanses of grass land on the north and west, and of forest and hill on the south and east. The general appearance of the district is extremely picturesque. On a clear day in winter the view to the north is bounded by the blue ranges of the outer Himalayas, behind which snowy peaks glisten brightly in the sun; while to the south and east lie range upon range of lower hills whose sides are clothed with the luxuriant vegetation of a tropical forest. The level rice fields, after the crop has been carried and stubble alone remains, might perhaps seem tame and uninteresting, were it not for the groves of slender palms and feathery bamboos with which they are broken up. During the rains this portion of the district is covered with a rich green carpet which gradually turns to gold, and on every side are swamps and rivers, hills and woods, to lend variety to the scene.

The māuzas fringing the Brahmaputra are deeply flooded in the rains and are for the most part covered with reeds, such as khagari (*saccharum spontaneum*), ikra (*saccharum arundinaceum*), and nal (*phragmites roxburghii*) which are from ten to twenty feet in height. The greater part of this tract lies too low for the growth of any trees except the simul (*bombax malabaricum*) which is dotted here and there over the surface of the plain. Nepali graziers keep large herds of buffaloes on the *churs* or sandbanks which are continually being formed by the Brahmaputra, and in the cold weather the villagers cut and burn the jungle, and sow mustard or summer rice in fields surrounded with a wall of reeds. These fields are described by the people as their *pams*. Their regular homes are often situated many miles away, near the land on which they grow transplanted rice; but at the commencement of the cold weather they move down to the *chapari* and live in little huts of grass during the time that ploughing and sowing is going on. Sometimes they return home while the crop is growing, and only revisit the *pam* to cut and thresh the harvest; sometimes they remain on during the whole cold weather. The mustard fields are dotted about, bright patches of vivid yellow in the dense green jungle, and come as a pleasant change to the inspecting officer who has generally reached them through footpaths, which are almost tunnels, shut in on either side by an impenetrable wall of grass and reeds. There is a pleasant feeling of freshness on these riparian flats on a foggy winter's morning. The soil is light and

springy, the partridges are to be heard calling in the jungle, the mustard when in flower has a strong but pleasant smell, and there is a general sense of freedom and an absence of restraint.

**The
southern
maunas.**

South of the Kapili, between Dharamtul and the hills, much of the country is again below flood level, and is covered with high grass jungle interspersed with *dolonis*, or marshes covered with the most luxuriant fodder grass, in which the cattle graze knee deep in the cold weather. The valley of the Kapili beyond Jamunamukh is very sparsely peopled. Part of this tract is marshy, part is rolling savannah, which supports a stunted growth of thatching grass and is almost destitute of trees. Further east, the valley of the Langpher is covered with dense tree forest. This forest covers the whole of the upper valley of the Dhansiri between the Mikir and the Naga Hills, and, prior to the construction of the Assam Bengal Railway, acted as a most complete and effectual barrier to all intercourse between the southern corners of Sibsagar and Nowgong. For fully ninety miles the railway runs through a pathless wilderness of trees, a desolate and malarious tract shut in by hills on either side; but east of Dimapur this dismal forest is included in the district of Sibsagar, and thus only a portion, though perhaps the larger portion, falls within the boundaries of Nowgong.

**Mountain
system.**

The two main mountain systems of the district are the Mikir Hills on the north and east; and, on the south and west, the outlying spurs which project from the Assam Range into the Brahmaputra Valley. The

Mikir Hills cover an area about 60 miles in length and 35 in breadth, but the greater portion of this tract lies in the neighbouring district of Sibsagar. Their western spurs from Kuthari to Dabaka are situated in Nowgong, and the hills that lie south of the Mohandiju and Jamuna rivers also fall within the boundaries of the district. They rise steeply from the narrow valleys with which they are intersected, and hill and valley alike are covered with dense tree forest, except in places where they have been cleared for the shifting cultivation of the Mikir tribe. The tops of the ranges in Nowgong average from one to two thousand feet in height, but Bar Kandali, the highest peak in the district, is nearly 3,000 feet above the level of the sea. These hills support a scanty population who grow dry rice, vegetables, and cotton on their slopes, and are seldom visited by the natives of the plains. The out-lying spurs of the Assam Range are somewhat lower, and the highest peak is Lusuri in Duar Amla mauza (2,400 feet). In appearance and general characteristics they do not differ materially from the Mikir Hills.

Apart from the two main systems there are numerous isolated hills dotted over the surface of the plain. Near Silghat there are two, one called Kamakhya and the other Hathimur, which overhang the Brahmaputra. On Kamakhya, whose summit is 800 feet above the sea, there is a temple sacred to Durga, where sacrifices are still offered to the goddess. A similar shrine on Hathimur is now neglected and has fallen into disrepair. Jamunamukh and Garubat are two mauzas

lying near the junction of the Kapili and the Jamuna, between the Mikir and the Khasi Hills, and here, as is only natural, a few outlying hills are found. One of these, named Madhpur, is a site for local worship, while on another, called Modartali, are the remains of a temple erected in honour of the goddess Kamala. Further west the level of the Kapili valley is unbroken, but in the Raha tahsil there are a few low hills, on one of which, Bashundori, there is an image of the goddess of that name and two of Gonesh. The south of Gobha is entirely hilly country, and on one of the peaks, called Deosal, there is a temple sacred to Mahadeo. Even in Tetelia mauza, north of the Kalang, there is a hill nearly 1,000 feet in height, and in Mayang, which is bounded on one side by the Brahmaputra, are two hills, Boha and Mayang, sacred to Gonesh. East of Ghugua, the country is a broad alluvial plain whose even surface is unbroken by the smallest elevation till the hills at Silghat rise above the horizon.

**River
system :
the Brahma-
putra.**

The principal river of Nowgong is the Brahmaputra, which flows along the whole of the northern boundary, and it is into the Brahmaputra that all the drainage of the district ultimately finds its way.

In this portion of its course the Brahmaputra displays in a pronounced degree the special characteristics by which it is distinguished in Assam. It oscillates from side to side of the sandy strath or valley through which it makes its way, and seldom follows the same course for many years. Its waters are surcharged with matter in suspension, and a snag or other slight obstruction in

the channel is liable to give rise to an almond shaped sandbank. The next flood may wash this bank away, or it may only serve to increase its size, and in a surprisingly short space of time a considerable island is formed covered with reeds and grass. Numerous backwaters and minor channels take off from the main stream, only to rejoin it a few miles lower down, and it is not merely one great drainage channel, but a regular system of streams surrounding and depending on the parent river. These streams enclose great *churs* and islands covered with elephant grass and reeds, and in the cold weather there is generally a foreshore of hot and glaring sand. In the rains these channels are full of water, and in places the river is several miles across. Even this great expanse is not enough to contain its waters, and in times of flood the river spreads over the low land at the side. At Silghat and Tezpur there are rocks and hills to give permanence to the channel, and west of Tezpur and near Bishnath the high bank comes right down to the water's edge, but, as a rule, the Brahmaputra is fringed with swamps and marshes, covered with high grass and reeds.
